The groundwater flow has never been gaged over time. We have flow from the Phase II ESA and the data from the Terex monitoring. That is why we have some permanent wells going in to get more data for the site's groundwater direction.

Ed

I have looked at the work plan for the Cedar Rapids Hub LRP site. Most of the plan looks pretty good (the sampling data will determine if the assessment is adequate). Historic data can be presented but may not provide all required information. Has the groundwater flow direction at the site ever been established by actual gaging. Is there a westerly component?

Hylton,

Did you get a chance to review the work plan for the Cedar Rapids HUB (Former Terex) parcel yet?

Ed

You can use it. I don't know whether that's all the GW sampling that will be required.

Sounds good. I was wondering if we could use the groundwater data from the previous Terex assessment of the area for the groundwater?

Let's talk after you get to review.

Ed,

I did receive the work plan. will try to get to the review this week
