Ms. Pasakarnis

The IDNR has reviewed the post soil removal groundwater monitoring report for the Iowa Northern Railway site in Waterloo, Iowa. Soil excavation completed in 2017 removed approximately 704 tons of contaminated soil from the site. The monitoring wells that remain on-site after the soil removal include MW-6, MW-7, MW-9, MW-11, and MW-12. The monitoring report recommends sampling these remaining wells annually for the next two years to determine stable/declining concentrations of petroleum contaminants using Methods OA-1 and OA-2. The IDNR concurs with the recommendation for annual groundwater sampling. Keep in mind that the results will determine the duration of the monitoring required to establish a stable/decreasing trend. Please contact me with any questions or comments. The best way to reach me is by email or phone at 641 373 2083.

Sincerely,

Hylton Jackson

Hylton,

I hope this email finds you healthy and well. Earlier this year we completed the reporting for a groundwater sampling event conducted late last year at the Iowa Northern Railway site (Site ID 1349) at 1330 Sheffield Avenue in Waterloo. I was under the impression that a hardcopy of the report was sent in February but I am beginning to fear that since I have neither seen it uploaded to the Contaminates Sites website or received a letter confirmation of this report that maybe it was not delivered as anticipated. I have attached a copy of the report here. If an additional hardcopy is needed, I can have one prepared this afternoon and sent directly.

If this is the first time you are receiving this, I apologize for the delay. This was prepared right before the start of COVID. I should have done a better job of checking in on the status (far sooner than now) but obviously the current state of affairs has complicated things somewhat. Please let me know if there are any issues opening the attachment.

Thank you,

Ashley
