Re: Livestock Transport, Ossian

Cal has briefly looked at the report and is bothered by the large number of chemicals detected at the site. Many of these chemicals are also above MCLs. He thinks we should ask the company to explain the presence of these chemicals. I have suggested that we can do that by expanding the history of the site. I think you told me orally how some of these came to be, but I want you to properly document it if the information is in previous report(s) or else get the responsible party to send us something in writing. The information should specify what these chemicals were used for and when, if possible. Are they still a continuing problem?

Secondly, the priority assigned to the site should remain as in the ISS. That is how we currently handle the priority level entry. This is something we may have to look at in the future (that is, change the priority with current information). But for now, once the priority has been assigned at the ISS stage, it stays with the site.

I'll like to see the revision again before it goes to Cal.
