Cooler/Sample Receipt and Temperature Log Form

Client Information

Client: Foth I+E

City/State: CITY | STATE WI | Project:

Receipt Information

Date/Time Received: DATE 1/27/23 | TIME 1240 | Received By: SJ

Delivery Type: ☐ UPS ☐ FedEx ☐ FedEx Ground ☐ US Mail ☐ Spee-Dee
☒ Lab Courier ☐ Lab Field Services ☐ Client Drop-off ☐ Other:_____

Condition of Cooler/Containers

Sample(s) received in Cooler? ☒ Yes ☐ No *If yes:* Cooler ID:

Multiple Coolers? ☐ Yes ☒ No *If yes:* Cooler # _____ of _____

Cooler Custody Seals Present? ☒ Yes ☐ No *If yes:* Cooler custody seals intact? ☒ Yes ☐ No

Sample Custody Seals Present? ☐ Yes ☒ No *If yes:* Sample custody seals intact? ☐ Yes ☐ No

Trip Blank Present? ☒ Yes ☐ No *If yes:* Which VOA samples are in cooler? ↓

All Samples

Temperature Record

Coolant: ☒ Wet ice ☐ Blue ice ☐ Dry ice ☐ Other:_____ ☐ NONE

Thermometer ID: P | Correction Factor (°C): +0.2

• **Temp Blank Temperature** – If no temp blank, or temp blank temperature above criteria, proceed to Sample Container Temperature

Uncorrected Temp (°C): 3.5 | Corrected Temp (°C): +0.2 3.7

• **Sample Container Temperature**

	CONTAINER 1	CONTAINER 2
Container(s) used:		
Uncorrected Temp (°C):		
Corrected Temp (°C):		

Exceptions Noted

1) If temperature exceeds criteria, was sample(s) received same day of sampling? ☐ Yes ☐ No
   a) *If yes:* Is there evidence that the chilling process began? ☐ Yes ☐ No

2) If temperature is <0°C, are there obvious signs that the integrity of sample containers is compromised? (e.g., bulging septa, broken/cracked bottles, frozen solid?) ☐ Yes ☐ No

NOTE. If yes, contact PM before proceeding If no, proceed with login

Note: Since laboratory accreditations are subject to change, Eurofins Environment Testing North Central LLC places the ownership of method, analyte & accreditation compliance upon our subcontract laboratories. This sample shipment is forwarded under chain-of-custody. If the laboratory does not currently maintain accreditation in the State of Origin listed above for analysis/tests/matrix being analyzed, the samples must be shipped back to the Eurofins Environment Testing North Central LLC laboratory or other instructions will be provided. Any changes to accreditation status should be brought to Eurofins Environment Testing North Central LLC attention immediately. If all requested accreditations are current to date, return the signed Chain of Custody attesting to said compliance to Eurofins Environment Testing North Central LLC.

Verified and Validated By:	Gina Wilming, Lead Environmental Scientist 2/27/2023

The analytical data were validated to verify that laboratory quality assurance and quality control (QA/QC) procedures were documented and to evaluate the overall quality of the data reported. The analytical report includes 1 investigative groundwater sample collected via low-flow sampling techniques at the Cedar Rapids Linn County Solid Waste Agency (CRLCSWA) Site 1 on January 27, 2023; samples are listed in Table 1. The data were collected in accordance with the *Hydrologic Monitoring System Plan* (HRG, 2006), Iowa Department of Natural Resources (IDNR) Sanitary Disposal Closure Permit Number 57-SDP-03-75C (including Amendments), and 567 Iowa Administrative Code (IAC) 113.10.

Validation Summary

Stage 2A data validation was performed on 100% of the data from this SDG, with review tasks and items of note documented in the summary table below.

Validation Task and Description	Review Notes	Action
Chain of Custody (COC) and Sample Receipt Form Confirm relinquish & receipt signatures. Confirm parameters and analytical methods match COC and Hydrologic Monitoring System Plan (HMSP).	All appropriate relinquish and receipt signatures were present. Parameters and analytical methods analyzed match the COC and current sampling program. A field blank was not requested, sampled, or analyzed during the January 2023 event. This event was limited to the first re-triggered baseline assessment monitoring for the full Appendix II list at MW-26. Project requirements do not require a field blank for events conducted outside a semiannual event.	Not applicable
Case Narrative Review for items noted by the laboratory that may impact the validation process.	The quality control issues noted in the case narrative were reviewed and found acceptable. Issues either were addressed in the comments below, had no impact on investigative samples, or were corrected/qualified by the laboratory. No additional actions are required. Note: continuing calibration verification (CCV) evaluation is not part of Stage 2A validation.	Not applicable

Validation Task and Description	Review Notes	Action
Sample Condition Upon Receipt (SCUR) Confirm samples in acceptable condition and no discrepancies noted. Confirm preservation meets method requirements.	Samples were received by Eurofins – Cedar Falls, IA in acceptable conditions. In addition, the herbicide and sulfide sample shipment from Eurofins – Cedar Falls, IA to Eurofins – Chicago, IL was received in acceptable conditions.	Not applicable
Methods Requested Confirm methods match project requirements and lab provided all methods ordered.	The methods ordered and analyzed were performed in accordance with the project requirements. Methods include United States Environmental Protection Agency (USEPA) 8260D Volatile Organic Compounds (VOCs), USEPA 8270E Semivolatile Organic Compounds (SVOCs), USEPA 8015C Acetonitrile and Isobutanol, USEPA 8081B Organochlorine Pesticides, USEPA 8082A Polychlorinated Biphenyls, USEPA 8151A Herbicides, USEPA 6020B Total Metals, USEPA 7470A Total Mercury, USEPA 9012 Cyanide, USEPA 9034 Sulfide, and United States Geological Survey (USGS) I-3765-85 Total Suspended Solids.	Not applicable
Analytes Requested Confirm analytes ordered match project requirements and lab provided all analytes ordered.	The analytes requested were analyzed in accordance with the project requirements. The laboratory provided all analytes ordered.	Not applicable
Holding Times Confirm laboratory performed extractions and analyses within method-required holding times.	Eurofins performed analysis within the method-required holding times.	Not applicable
Blanks Confirm no detections in laboratory method blanks, field blanks, and trip blanks.	Table 3 is intended to present analytes detected in the method, field, and trip blanks. As detailed in the COC and Sample Receipt Form Review Notes, a field blank sample was not collected during the January 2023 event. No detections were found in the method and trip blanks.	Not applicable
Surrogates or Deuterated Monitoring Compounds For *organic analyses only*, confirm surrogates analyzed and surrogate recovery within QC limits.	Table 4 is intended to present surrogate recoveries that were outside the control limits. Surrogate recoveries were within control limits for this SDG.	Not applicable
Matrix Spike/Matrix Spike Duplicates (MS/MSDs) Confirm MS/MSDs analyzed at frequency specified by project requirements and MS/MSD percent recovery within lab specified limits. Confirm, for Organic analytes, MSD relative percent difference (RPD) within limits. For inorganic analytes, lab replicate RPD within limits.	MS/MSD quality control samples are not required for this project. As a result, no MS/MSD samples were collected or submitted for analysis. Where analyzed and reported by the laboratory, MS/MSD results associated with the samples in 310-248830-1 are reviewed under Stage 2A validation guidelines. Table 5 is intended to present MS/MSD recoveries and RPDs that were outside the control limits, MS/MSD recoveries and RPDs were within control limits for this SDG.	Not applicable

Validation Task and Description	Review Notes	Action
Laboratory Control Sample/Laboratory Control Sample Duplicates (LCS/LCSDs) Confirm LCS analyzed and LCS/LCSD recovery and RPD within lab specified limits.	LCS/LCSD quality control samples are not required for this project. Where analyzed and reported by the laboratory, LCS/LCSD results associated with method batches in 310-248830-1 are reviewed under Stage 2A validation guidelines. Table 6 presents the LCS/LCSD recoveries and RPDs that were outside the control limits. Qualifiers are assigned in Table 9. The 1,4-phenylenediamine LCS and LCSD recoveries associated with prep batch 377951 were below the recovery limit (20%-120%), indicating potential low bias. In accordance with the *National Functional Guidelines for Organic Superfund Methods Data Review* (USEPA, 2020a) for SVOCs, when LSC and LCSD recoveries are both below the recovery limit, non-detect sample results from the same prep batch are qualified R (i.e., MW-26_23_01). Resampling is not recommended for the rejected 1,4-phenylenediamine datum since 1,4-phenylenediamine was sampled and analyzed at MW-26 in January 2023 as part of the re-triggered quarterly baseline assessment monitoring for the full Appendix II list, this parameter has not been detected at MW-26, and 1,4-phenylenediamine will be included in the 2nd quarterly baseline assessment monitoring event. The Spring 2023 Statistical Notifications report will provide recommendations regarding baseline sampling at MW-26. The 2,4-dinitrophenol, dinoseb, and hexachloropropene LCS recoveries associated with prep batch 377951 were below the recovery limit (i.e., 10%-110% for 2,4-dinitrophenol and hexachloropropene and 20%-120% for dinoseb); however, the LCSD recoveries were within the recovery limits. Similarly, the 3,3'-dimethylbenzidine LCSD recovery associated with batch 377951 was below the recovery limit (20%-120%); however, the LCS recovery was within the recovery limit. For LCS/LCSD recovery, qualifiers are typically only assigned if both LCS and LCSD recoveries are outside the control limits; therefore, no qualifiers were assigned to the associated 2,4-dinitrophenol, 3,3'-dimethylbenzidine, dinoseb, and hexachloropropene results from prep batch 377951. The 2,4-dinitrophenol, 2-naphthylamine, 3,3'-dimethylbenzidine, 4,6-dinitro-2-methylphenol, 4-aminobiphenyl, dinoseb, and hexachloropropene LCS/LCSD RPDs associated with prep batch 377951 were above the RPD limit (35%). In accordance with the approved data validation SOP, when LCS/LCSD RPD is above the RPD limit for SVOCs, non-detect sample results from the same prep batch are not qualified.	Yes, qualifier assigned & resampling is not recommended No qualifiers assigned No qualifiers assigned

Validation Task and Description	Review Notes	Action
Laboratory Duplicates Confirm lab duplicates analyzed and RPD within lab specified limits.	Laboratory duplicate quality control samples are not required for this project. Where analyzed and reported by the laboratory, laboratory duplicate results associated with the samples in 310-248830-1 are reviewed under Stage 2A validation guidelines. Table 7 is intended to present the lab duplicate sample RPDs that were outside the RPD limits. None of the lab duplicate samples analyzed for this SDG were associated with Site 1 samples.	Not applicable
Field Duplicates Confirm field duplicates collected at required frequency and field duplicate RPD within acceptable limits.	Table 8 is intended to present the precision evaluation of the parent/field duplicate samples. No field duplicates were submitted for analysis. The event was limited to the first re-triggered baseline assessment monitoring for the full Appendix II list at MW-26. Project requirements do not require a field duplicate for events conducted outside a semiannual event.	Not applicable

Abbreviations:
CCV = continuing calibration verification
COC = chain of custody
HMSP = Hydrologic Monitoring System Plan
LCS = laboratory control sample
LCSD = laboratory control sample duplicate
MS = matrix spike
MSD = matrix spike duplicate
QA = quality assurance
QC = quality control
RPD = relative percent difference
SCUR = sample condition upon receipt
SDG = sample delivery group
SOP = standard operating procedure
SVOC = semivolatile organic compound
USEPA = United States Environmental Protection Agency
USGS = United States Geological Survey
VOC = volatile organic compound

Overall Assessment of Data

Item	Acceptable Yes	Acceptable No	Comments
1. Method Criteria	X		Samples were collected, preserved, shipped/delivered, and analyzed within the method protocols.
2. Precision	X		Field precision was not evaluated since a field duplicate sample was not collected. The event was limited to the first re-triggered baseline assessment monitoring for the full Appendix II list at MW-26. Project requirements do not require a field duplicate for events conducted outside a semiannual event. Laboratory precision was evaluated through MS/MSD, LCS/LCSD, and laboratory duplicate RPDs. None of the lab duplicate samples analyzed for this SDG were associated with Site 1 samples. MS/MSD recoveries and RPDs were within control limits. LCS/LCSD RPDs were outside the control limits for several SVOC compounds, but no qualifiers were assigned since the associated results were non-detect.

Item	Acceptable		Comments
	Yes	No	
3. Accuracy	X		Accuracy was evaluated through surrogate, MS/MSD, and LCS/LCD recovery. The % recoveries for surrogates and MS/MSD samples were within control limits. LCS/LCSD recoveries were outside the control limits for several SVOC compounds, with only one qualifier being assigned (i.e., R qualifier for 1,4-phenylenediamine in MW-26_23_01) as listed in Table 9. Resampling is not recommended for the rejected 1,4-phenylenediamine datum since 1,4-phenylenediamine was sampled and analyzed at MW-26 in January 2023 as part of the re-triggered quarterly baseline assessment monitoring for the full Appendix II list, this parameter has not been detected at MW-26, and 1,4-phenylenediamine will be included in the 2nd quarterly baseline assessment monitoring event. The Spring 2023 Statistical Notifications report will provide recommendations regarding baseline sampling at MW-26.
4. Representativeness	X		Sampling was conducted in accordance with the sample collection procedures described in the approved HMSP, approved HMSP revisions, and standard operating procedures (SOPs).
5. Comparability	X		Collection techniques, measurement procedures, methods, and reporting were equivalent to currently approved procedures and are comparable to historical data.
6. Completeness	X		Valid analytical results exceeded 90%.
7. Suitability for Intended Use	X		No evidence of gross contamination or significant issues with the method criteria, precision, accuracy, representativeness, comparability, or completeness were identified.

Overall, the data reported are of good quality and the results for the QA/QC measurements that were used by the laboratories during the analysis of the samples were generally acceptable. Some sample results required qualification during data validation because method-specific QA/QC criteria were not met; results may be qualified for more than one reason. Qualified data are usable (unless qualified as rejected [R]), represent data of good quality and reasonable confidence, and have an acceptable degree of uncertainty (i.e., may be less precise or less accurate than unqualified data). Table 2 provides a definition of the qualifiers that may be assigned by the validator and/or retained from the laboratory. A summary of the validation qualifiers is provided below.

- No results were qualified as estimated (assigned a J qualifier), biased low (assigned as J- qualifier), biased high (assigned as J+ qualifiers), non-detect at concentrations less than the reporting limit or less than the sample result (assigned as U qualifier), non-detect with the reporting limit an estimated value (assigned as UJ, UJ+, or UJ- qualifiers), or presumptive evidence of presence of an analyte (assigned as N or NJ qualifiers).
- One result (0.4%) was not usable or rejected (assigned as R qualifier).
- 99.6% of the data is usable for project data quality objectives.

Tables

Table 1
Sample IDs Reviewed

Project Sample ID	Analyzed Lab Sample ID	Project Sample ID Matches Lab Client Sample ID	Lab Sample Date/Time Match COC/Logbook	Parameters and Analytical Methods Match COC	Sample Type
MW-26_23_02	310-248830-1	Yes	Yes	Yes	Normal
TB-1_23_02	310-248830-2	Yes	Yes	Yes	TB

Notes:
TB = trip blank

Table 2
Data Qualifiers That May Be Used to Qualify Analytical Results During Validation

Qualifier	Explanation
U	The analyte was analyzed for and was not detected above the numerical quantitation limit.
J	The analyte was analyzed for and was positively identified, but the analytical result (i.e., quantitation) is an estimated value. In some cases it is recognized that the estimated value is biased high (J+) suggesting the actual value is lower than estimated; or biased low (J-) suggesting the actual value is higher than estimated.
UJ	The analyte was analyzed for and was not detected above the reporting limit, but the reporting limit is an estimated value.
R	The analyte was analyzed for but may or may not be present and/or quantifiable due to quality control issues. The analytical result is not usable and should be rejected.
N	The analysis indicates presumptive evidence of the presence of the analyte.
NJ	The analysis indicates presumptive evidence of the presence of the analyte, but the numerical value is an estimated quantity.

Notes:
Results qualified as "J" or "UJ" are of acceptable data quality and may be used quantitatively per United States Environmental Protection Agency guidelines.

Table 3
Method, Field, and Trip Blank Exceedances [1]

Lab Report	Blank Type	Lab Sample ID	Analysis Batch	Prep Batch	Parameter	Result	Units	Lab Qualifier	MDL	PQL	Associated Samples
No detections were found in the method and trip blanks.											

Notes:
MDL = minimum detection limit
PQL = practical quantitation limit
[1] A field blank sample was not collected during the January 2023 event. See COC and Sample Receipt Form Review Notes.

Table 4
Surrogate Recovery Exceedances

Lab Sample ID	Parent Sample	Parameter	Surrogate % Recovery	% Recovery Limits
Surrogate recoveries were within control limits for this Sample Delivery Group.				

Notes:
% = percent

Table 5
Matrix Spike - Matrix Spike Duplicate Exceedances

Lab Sample ID	Parent Sample	Parameter	MS % Recovery	MSD % Recovery	% Recovery Limits	RPD	RPD Limit
MS/MSD recoveries and RPDs were within control limits for this Sample Delivery Group.							

Notes:
% = percent
MS = matrix spike
MSD = matrix spike duplicate
RPD = relative percent difference

Table 6
Laboratory Control Sample and Laboratory Control Sample Duplicate Exceedances

Lab Sample ID	Associated SDG Batch	Parameter	LCS % Recovery	LCSD % Recovery	% Recovery Limits		RPD	RPD Limit
LCS 310-377951/2-A	377951	1,4-Phenylenediamine	0.2	0.3	20	120	33	35
LCSD 310-377951/3-A								
LCS 310-377951/2-A	377951	2,4-Dinitrophenol	8	14	10	110	53	35
LCSD 310-377951/3-A

LCS 310-377951/2-A	377951	4-Aminobiphenyl	68	47	20	120	37	35
LCSD 310-377951/3-A								
LCS 310-377951/2-A	377951	Dinoseb	16	26	20	120	50	35
LCSD 310-377951/3-A								
LCS 310-377951/2-A	377951	Hexachloropropene	9	16	10	110	51	35
LCSD 310-377951/3-A								

Notes:
% = percent
LCS = laboratory control sample
LSCD = laboratory control sample duplicate
RPD = relative percent difference
SDG = sample delivery group

Table 7
Laboratory Duplicate Sample Exceedances

Lab Sample ID	Client Sample ID	Parameter	RPD	RPD Limit
None of the lab duplicate samples analyzed for this Sample Delivery Group were associated with Site 1 samples.				

Notes:
RPD = relative percent difference

Table 8
Relative Percent Difference (RPD) Analysis for Field Duplicate Samples

RPD = $\dfrac{\text{absolute value (a - b)}}{\text{(a + b)/2}} \times 100\%$

Acceptance Criteria*: 35%

* Unless otherwise noted in project planning documents, the acceptance criteria for field duplicates RPD is as follows:
- For analytes with concentrations greater than 5x (2x for soil matrices) the reporting limit, the RPD should be within 35% for water matrices (50% for soil matrices).
- For analytes with either or both concentrations less than 5x (2x for soil matrices) the reporting limit (indicated below by "low-level"), the absolute difference between the sample and field duplicate should not exceed 5x the reporting limit.

Duplicate Result Analysis:

Parameter	Unit	Parent	Duplicate Sample	RPD	Acceptable?
No field duplicate samples were collected.					

Table 9
Qualified Results from Data Validation

Sample ID	Lab Sample ID	Method	Parameter	Result	Lab Qualifier	Units	Qualified Result	Validator Qualifier	Explanation
MW-26_23_01	310-248830-1	USEPA 8270E	1,4-Phenylenediamine	<2.07	U	ug/L	<2.07	R	Associated LCS and LCSD recoveries were below the lower acceptance limit, indicating low bias.

Notes:
This table only lists validator qualified data. Not all laboratory qualified data are listed; only the laboratory qualified data that was validator qualified are included.
< = less than
LCS = laboratory control sample
LSCD = laboratory control sample duplicate
ug/L = micrograms per liter
USEPA = United States Environmental Protection Agency

Comments
No additional comments.

Receipt
The samples were received on 3/24/2023 2:45 PM. Unless otherwise noted below, the samples arrived in good condition, and where required, properly preserved and on ice. The temperatures of the 5 coolers at receipt time were -0.1º C, 0.4º C, 0.8º C, 1.0º C and 1.2º C.

GC/MS VOA
Method 8260D: The following sample(s) was collected in a properly preserved vial; however, the pH was outside the required criteria when verified by the laboratory. The sample was analyzed within the 7-day holding time specified for unpreserved samples: FD-1_23_03 (310-252084-14).

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

GC/MS Semi VOA
Method 8270E: The RPD of the laboratory control sample (LCS) and laboratory control sample duplicate (LCSD) for preparation batch 310-382259 and analytical batch 310-382466 recovered outside control limits for the following analytes: 4-Chloroaniline.

Method 8270E: The continuing calibration verification (CCV) associated with batch 310-382563 recovered above the upper control limit for 1,3,5-Trinitrobenzene (67.1%D), N-Nitrosopiperidine (24.5%D) and N-Nitrosomethylethylamine (25.8%D). The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

GC Semi VOA
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Metals
Method 3005A: The reference method requires samples to be preserved to a pH of <2. The following sample was received with insufficient preservation at a pH of >2: MW-13_23_03 (310-252084-2). The sample(s) was preserved to the appropriate pH in the laboratory.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

General Chemistry
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Organic Prep
Methods 3510C, 608: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with preparation batch 310-382246.The laboratory control sample (LCS) was performed in duplicate (LCSD) to provide precision data for this batch.

Methods 3510C, 625: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with preparation batch 310-382259.The laboratory control sample (LCS) was performed in duplicate (LCSD) to provide precision data for this batch.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

VOA Prep
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

GC/MS Semi VOA

Qualifier	Qualifier Description
*1	LCS/LCSD RPD exceeds control limits.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Metals

Qualifier	Qualifier Description
B	Compound was found in the blank and sample.
F1	MS and/or MSD recovery exceeds control limits.
F2	MS/MSD RPD exceeds control limits
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Accreditation/Certification Summary

Client: Foth Infrastructure & Environment, LLC
Job ID: 310-252084-1
Project/Site: CRLCSWA Site 1

Laboratory: Eurofins Cedar Falls

Unless otherwise noted, all analytes for this laboratory were covered under each accreditation/certification below.

Authority	Program	Identification Number	Expiration Date
Iowa	State	007	12-01-23

The following analytes are included in this report, but the laboratory is not certified by the governing authority. This list may include analytes for which the agency does not offer certification.

Analysis Method	Prep Method	Matrix	Analyte
8260D		Water	1,2,4-Trichlorobenzene
8260D		Water	Allyl chloride
8260D		Water	Ethyl methacrylate
8260D		Water	m,p-Xylene
8260D		Water	o-Xylene

Laboratory: Eurofins Chicago

The accreditations/certifications listed below are applicable to this report.

Authority	Program	Identification Number	Expiration Date
Iowa	State	082	05-01-24

Method Summary

Client: Foth Infrastructure & Environment, LLC
Job ID: 310-252084-1
Project/Site: CRLCSWA Site 1

Method	Method Description	Protocol	Laboratory
8260D	Volatile Organic Compounds by GC/MS	SW846	EET CF
8270E	Semivolatile Organic Compounds (GC/MS)	SW846	EET CF
8015C	Nonhalogenated Organic using GC/FID (Direct Aqueous Injection)	SW846	EET CF
8081B	Organochlorine Pesticides (GC)	SW846	EET CF
8082A	Polychlorinated Biphenyls (PCBs) by Gas Chromatography	SW846	EET CF
6020B	Metals (ICP/MS)	SW846	EET CF
7470A	Mercury (CVAA)	SW846	EET CF
9012B	Cyanide, Total andor Amenable	SW846	EET CF
9034	Sulfide, Acid soluble and Insoluble (Titrimetric)	SW846	EET CHI
I-3765-85	Residue, Non-filterable (TSS)	USGS	EET CF
8151	SW846 8151 Herbicide	SW846	SC0005
3005A	Preparation, Total Metals	SW846	EET CF
3510C	Liquid-Liquid Extraction (Separatory Funnel)	SW846	EET CF
5030B	Purge and Trap	SW846	EET CF
7470A	Preparation, Mercury	SW846	EET CF
9012B	Cyanide, Total and/or Amenable, Distillation	SW846	EET CF
9030B	Sulfide, Distillation (Acid Soluble and Insoluble)	SW846	EET CHI

Note: Since laboratory accreditations are subject to change, Eurofins Environment Testing North Central, LLC places the ownership of method, analyte & accreditation compliance upon our subcontract laboratories. This sample shipment is forwarded under chain-of-custody. If the laboratory does not currently maintain accreditation in the State of Origin listed above for analysis/tests/matrix being analyzed, the samples must be shipped back to the Eurofins Environment Testing North Central, LLC laboratory or other instructions will be provided. Any changes to accreditation status should be brought to Eurofins Environment Testing North Central, LLC attention immediately. If all requested accreditations are current to date, return the signed Chain of Custody attesting to said compliance to Eurofins Environment Testing North Central, LLC.

Data Validation Report

Project Name:	CRLCSWA Site 1 – Cedar Rapids, IA (22C061.00)
Task Name:	22C061_23_03
Data Set Description:	Spring 2023 Groundwater Event
Laboratory(s):	Eurofins – Cedar Falls, IA and Chicago, IL Keystone Laboratories – Newton, IA
Laboratory Sample Delivery Group (SDG) ID(s):	310-252084-1
Sample Collection Dates:	3/22/2023 – 3/24/2023
Sample Analysis Dates:	3/27/2023 – 4/6/2023
Sample Matrices:	Groundwater
Sample IDs Reviewed:	See Table 1
Verification and Validation Stage, 100% data:	☐ 1 ☒ 2A ☐ 2B ☐ 3 ☐ 4
Verified and Validated By:	Gina Wilming, Senior Project Manager 4/19/2023

The analytical data were validated to verify that laboratory quality assurance and quality control (QA/QC) procedures were documented and to evaluate the overall quality of the data reported. Analytical reports include 13 investigative groundwater samples collected via low-flow or no-purge sampling techniques at the Cedar Rapids Linn County Solid Waste Agency (CRLCSWA) Site 1 from March 22 to 24, 2023; samples are listed in Table 1. The data were collected in accordance with the *Hydrologic Monitoring System Plan* (HRG, 2006), Iowa Department of Natural Resources (IDNR) Sanitary Disposal Closure Permit Number 57-SDP-03-75C (including Amendments), and 567 Iowa Administrative Code (IAC) 113.10.

Validation Summary

Stage 2A data validation was performed on 100% of the data from this SDG, with review tasks and items of note documented in the summary table below.

Validation Task and Description	Review Notes	Action
Chain of Custody (COC) and Sample Receipt Form Confirm relinquish & receipt signatures. Confirm parameters and analytical methods match COC and Hydrologic Monitoring System Plan (HMSP).	All appropriate relinquish and receipt signatures were present. Parameters and analytical methods analyzed match the COC and current sampling program. Eurofins inadvertently omitted the plastic 1-liter container for TSS sample collection at MW-26_23_03, MW-37_23_03, MW-101A-23_03, and FB-1_23_03. Eurofins was able to conduct TSS analysis for these samples using samples collected in another unpreserved glass container. Trip blanks TB-2_23_03 and TB-3_23_03 were provided by the lab but were not analyzed since only one shipment of volatile samples occurred and TB-1_23_03 was utilized as the trip blank for that shipment. The COC notes indicated not to perform analysis on TB-2_23_03 and TB-3_23_03.	Not applicable

Validation Task and Description	Review Notes	Action
Case Narrative Review for items noted by the laboratory that may impact the validation process.	As detailed in the Sample Condition Upon Receipt (SCUR) Review Notes, the case narrative noted quality control issues with pH preservation for the volatile organic compound (VOC) analysis at FD-1_23_03 and the total metals analysis at MW-13_23_03. The remaining quality control issues noted in the case narrative were reviewed and found acceptable. Issues either were addressed in the comments below, had no impact on investigative samples, or were corrected/qualified by the laboratory. No additional actions are required. Note: continuing calibration verification (CCV) evaluation is not part of Stage 2A validation.	No qualifiers assigned Not applicable
Sample Condition Upon Receipt Confirm samples in acceptable condition and no discrepancies noted. Confirm preservation meets method requirements.	With the exception identified below, samples were received by Eurofins – Cedar Falls, IA in acceptable conditions. In addition, the sulfide sample shipment from Eurofins – Cedar Falls, IA to Eurofins – Chicago, IL, and the herbicides sample shipment from Eurofins – Cedar Falls, IA to Keystone Laboratories – Newton, IA were received in acceptable conditions. The Case Narrative indicated that properly preserved vials were filled for VOC analysis at FD-1_23_03; however, pH was outside the required criteria when verified by the laboratory. In accordance with the *National Functional Guidelines for Organic Superfund Methods Data Review* (USEPA, 2020a), the technical holding time for aqueous samples that are properly cooled and pH greater than (>) 2 is 7 days. Since the VOC analysis was conducted within the 7-day holding time for unpreserved vials, no qualifiers are assigned. The total metals container for MW-13_23_03 was received with a pH >2, and Eurofins adjusted the pH to less than (<) 2 upon receipt. In accordance with the *National Functional Guidelines for Inorganic Superfund Methods Data Review* (USEPA, 2020b), Inductively Coupled Plasma Mass Spectrometry (ICP-MS) metals samples adjusted to a pH <2 by the laboratory do not require qualification.	Not applicable No qualifiers assigned No qualifiers assigned
Methods Requested Confirm methods match project requirements and lab provided all methods ordered.	The methods ordered and analyzed were performed in accordance with the project requirements. Methods include United States Environmental Protection Agency (USEPA) 8260D VOCs, USEPA 8270E Semivolatile Organic Compounds (SVOCs), USEPA 8015C Nonhalogenated Organics, USEPA 8151A Herbicides, USEPA 8081B Organochlorine Pesticides, USEPA 8082A Polychlorinated Biphenyls (PCBs), USEPA 6020B Total Metals, USEPA 7470A Total Mercury, USEPA 9012B Cyanide, USEPA 9034 Sulfide, and United States Geological Survey (USGS) I-3765-85 Total Suspended Solids.	Not applicable
Analytes Requested Confirm analytes ordered match project requirements and lab provided all analytes ordered.	The analytes requested were analyzed in accordance with the project requirements. The laboratory provided all analytes ordered.	Not applicable

Validation Task and Description	Review Notes	Action
Holding Times Confirm laboratory performed extractions and analyses within method-required holding times.	Eurofins and Keystone Laboratories performed analysis within the method-required holding times.	Not applicable
Blanks Confirm no detections in laboratory method blanks, field blanks, and trip blanks.	Table 3 presents analytes detected in the method, field, and trip blanks. No detections were found in the trip blank. Qualifiers are assigned in Table 9. Antimony was detected in the method blank (MB 310-382513/1-A) at a concentration of 0.000757 J mg/L. In accordance with the *National Functional Guidelines for Inorganic Superfund Methods Data Review* (USEPA, 2020b) for ICP-MS metals, when the blank contamination concentration is J-flagged, associated non-detect sample results are not qualified and associated J-flagged sample results are assigned a U qualifier and reported at the practical quantitation limit (PQL). Toluene was detected in the field blank (FB-1_23_03) at a concentration of 0.597 J ug/L. In accordance with the *National Functional Guidelines for Organic Superfund Methods Data Review* (USEPA, 2020a) for VOCs, when the blank contamination concentration is J-flagged, associated non-detect sample results are not qualified and associated J-flagged sample results are assigned a U qualifier and reported at the PQL.	Yes qualifiers assigned Yes qualifiers assigned
Surrogates or Deuterated Monitoring Compounds For *organic analyses only*, confirm surrogates analyzed and surrogate recovery within QC limits.	Table 4 is intended to present surrogate recoveries that were outside the control limits. Surrogate recoveries were within control limits for this SDG.	Not applicable
Matrix Spike/Matrix Spike Duplicates (MS/MSDs) Confirm MS/MSDs analyzed at frequency specified by project requirements and MS/MSD percent recovery within lab specified limits. Confirm, for Organic analytes, MSD relative percent difference (RPD) within limits. For inorganic analytes, lab replicate RPD within limits.	MS/MSD quality control samples are not required for this project. As a result, no MS/MSD samples were collected or submitted for analysis. Where analyzed and reported by the laboratory, MS/MSD results associated with the samples in 310-252084-1 are reviewed under Stage 2A validation guidelines. Table 5 is intended to present MS/MSD recoveries and RPDs that were outside the control limits, MS/MSD recoveries and RPDs were within control limits for this SDG.	Not applicable

Validation Task and Description	Review Notes	Action
Laboratory Control Sample/Laboratory Control Sample Duplicates (LCS/LCSDs) Confirm LCS analyzed and LCS/LCSD recovery and RPD within lab specified limits.	LCS/LCSD quality control samples are not required for this project. Where analyzed and reported by the laboratory, LCS/LCSD results associated with method batches in 310-252084-1 are reviewed under Stage 2A validation guidelines. Table 6 presents the LCS/LCSD recoveries and RPDs that were outside the control limits. LCS/LCSD recoveries were within control limits for this SDG. No qualifiers were assigned due to the LCS/LCSD RPD exceedance. The 4-chloroaniline LCS/LCSD RPD associated with prep batch 382259 was above the RPD limit (35%). In accordance with the approved data validation Standard Operating Procedure (SOP), when LCS/LCSD RPD is above the RPD limit for SVOCs, non-detect sample results from the same prep batch are not qualified.	No qualifiers assigned
Laboratory Duplicates Confirm lab duplicates analyzed and RPD within lab specified limits.	Laboratory duplicate quality control samples are not required for this project. Where analyzed and reported by the laboratory, laboratory duplicate results associated with the samples in 310-252084-1 are reviewed under Stage 2A validation guidelines. Table 7 is intended to present the lab duplicate sample RPDs that were outside the RPD limits. RPDs were within the lab-specified RPD limits for this SDG.	Not applicable
Field Duplicates Confirm field duplicates collected at required frequency and field duplicate RPD within acceptable limits.	Field duplicate samples were collected at a 1 per 10 frequency in accordance with the project requirements. Table 8 contains the precision evaluation of the parent/field duplicate samples. The RPDs between the investigative and field duplicate samples were within the duplicate sample validation criteria.	Not applicable

Abbreviations:
> = greater than
< = less than
CCV = continuing calibration verification
COC = chain of custody
HMSP = Hydrologic Monitoring System Plan
ICP-MS = inductively coupled plasma mass spectrometry
mg/L = milligram per liter
LCS = laboratory control sample
LCSD = laboratory control sample duplicate
MS = matrix spike
MSD = matrix spike duplicate
PQL = Practical Quantification Limit
QA = quality assurance
QC = quality control
PCB = polychlorinated biphenyl
RPD = relative percent difference
SCUR = sample condition upon receipt
SDG = sample delivery group
SOP = standard operating procedures
SVOC = semivolatile organic compound
ug/L = microgram per liter

Abbreviations (Continued):
USEPA = United States Environmental Protection Agency
USGS = United States Geological Survey
VOC = volatile organic compound

Overall Assessment of Data

Item	Acceptable		Comments
	Yes	No	
1. Method Criteria	X		Samples were collected, preserved, shipped/delivered, and analyzed within the method protocols, except for VOCs at FD-1_23_03 and total metals at MW-13_23_03. During sample check-in, the vials for VOC analysis at FD-1_23_03 were outside the required pH preservation criteria. VOC analysis at FD-1_23_03 was conducted within the 7-day holding time for unpreserved vials; no qualifiers were assigned. The total metals container for MW-13_22_03 was received with a pH >2 but adjusted by Eurofins to pH <2 upon receipt. ICP-MS metals samples adjusted to a pH <2 by the laboratory do not require qualification.
2. Precision	X		Field precision was evaluated through investigative and field duplicate RPDs. The RPDs between the investigative and field duplicate samples were within the duplicate sample validation criteria. Laboratory precision was evaluated through MS/MSD, LCS/LCSD, and laboratory duplicate RPDs. Where analyzed and reported by the laboratory, MS/MSD and laboratory duplicate RPDs were within control limits. With the exception identified below, LCS/LCSD RPDs were within control limits. The 4-chloroaniline LCS/LCSD RPD associated with prep batch 382259 was above the RPD limit. Details are provided in the LCS/LCSD section of the Validation Summary above. No qualifiers were assigned since the associated 4-chloroaniline concentrations were non-detect.
3. Accuracy	X		Accuracy was evaluated through surrogate, MS/MSD, and LCS/LCD recovery. The % recoveries for surrogates or spiked samples were within control limits.
4. Representativeness	X		Sampling was conducted in accordance with the sample collection procedures described in the approved HMSP, approved HMSP revisions, and SOPs.
5. Comparability	X		Collection techniques, measurement procedures, methods, and reporting were equivalent to currently approved procedures and are comparable to historical data.
6. Completeness	X		Valid analytical results exceeded 90%.
7. Suitability for Intended Use	X		No evidence of gross contamination or significant issues with the method criteria, precision, accuracy, representativeness, comparability, or completeness were identified.

Overall, the data reported are of good quality and the results for the QA/QC measurements that were used by the laboratories during the analysis of the samples were generally acceptable. Some sample results required qualification during data validation because method-specific QA/QC criteria were not met; results may be qualified for more than one reason. Qualified data are usable (unless qualified as rejected [R]), represent data of good quality and reasonable confidence, and have an acceptable degree of

uncertainty (i.e., may be less precise or less accurate than unqualified data). Table 2 provides a definition of the qualifiers that may be assigned by the validator and/or retained from the laboratory. A summary of the validation qualifiers is provided below.

- No results were qualified as estimated (assigned as J qualifiers), biased low (assigned as J- qualifier), biased high (assigned as J+ qualifiers), non-detect with the reporting limit an estimated value (assigned as UJ, UJ+, or UJ- qualifiers), presumptive evidence of presence of an analyte (assigned as N or NJ qualifiers), or not usable and rejected (assigned as R qualifier).
- Three results (0.2%) were qualified as non-detect at a concentration less than the reporting limit or less than the sample result (assigned as U qualifiers).
- 100% of the data is usable for project data quality objectives.

Table 2
Data Qualifiers That May Be Used to Qualify Analytical Results During Validation

Qualifier	Explanation
U	The analyte was analyzed for and was not detected above the numerical quantitation limit.
J	The analyte was analyzed for and was positively identified, but the analytical result (i.e., quantitation) is an estimated value. In some cases it is recognized that the estimated value is biased high (J+) suggesting the actual value is lower than estimated; or biased low (J-) suggesting the actual value is higher than estimated.
UJ	The analyte was analyzed for and was not detected above the reporting limit, but the reporting limit is an estimated value.
R	The analyte was analyzed for but may or may not be present and/or quantifiable due to quality control issues. The analytical result is not usable and should be rejected.
N	The analysis indicates presumptive evidence of the presence of the analyte.
NJ	The analysis indicates presumptive evidence of the presence of the analyte, but the numerical value is an estimated quantity.

Notes:
Results qualified as "J" or "UJ" are of acceptable data quality and may be used quantitatively per United States Environmental Protection Agency guidelines.

Table 3
Method, Field, and Trip Blank Exceedances

Lab Report	Blank Type	Lab Sample ID	Analysis Batch	Prep Batch	Parameter	Result	Units	Lab Qualifier	MDL	PQL	Associated Samples
310-252084-1	Method	MB 310-382513/1-A	382841	382513	Antimony	0.000757	mg/L	J	0.00069	0.002	MW-14_23_03, MW-16_23_03, MW-17_23_03, MW-26_23_03, MW-32_23_03, MW-33_23_03, MW-37_23_03, MW-38_23_03, MW-101A_23_03, MW-101B_23_03, MW-109B_23_03, FD-1_23_03, FD-2_23_03, FB-1_23_03
310-252084-1	Field	310-252084-16	382264	N/A	Toluene	0.597	ug/L	J	0.43	1.00	Investigative and FD samples in 310-252084-1

Notes:
FD = field duplicate
mg/L = milligrams per liter
MDL = minimum detection limit
N/A = not applicable
PQL = practical quantitation limit
ug/L = micrograms per liter

Table 4
Surrogate Recovery Exceedances

Lab Sample ID	Parent Sample	Parameter	Surrogate % Recovery	% Recovery Limits
Surrogate recoveries were within control limits for this Sample Delivery Group.				

Notes:
% = percent

Table 5
Matrix Spike - Matrix Spike Duplicate Exceedances

Lab Sample ID	Parent Sample	Parameter	MS % Recovery	MSD % Recovery	% Recovery Limits	RPD	RPD Limit
MS/MSD recoveries and RPDs were within control limits for this Sample Delivery Group.							

Notes:
% = percent
MS = matrix spike
MSD = matrix spike duplicate
RPD = relative percent difference

Table 6
Laboratory Control Sample and Laboratory Control Sample Duplicate Exceedances

Lab Sample ID	Associated SDG Batch	Parameter	LCS % Recovery	LCSD % Recovery	% Recovery Limits		RPD	RPD Limit
LCS 310-382259/2-A	382259	4-Chloroaniline	89	58	10	121	41	35
LCSD 310-382259/3-A								

Notes:
% = percent
LCS = laboratory control sample
LSCD = laboratory control sample duplicate
RPD = relative percent difference
SDG = sample delivery group

Table 7
Laboratory Duplicate Sample Exceedances

Lab Sample ID	Client Sample ID	Parameter	RPD	RPD Limit
Lab duplicate sample RPDs were within the RPD limits for this Sample Delivery Group.				

Notes:
RPD = relative percent difference

Table 8
Relative Percent Difference (RPD) Analysis for Field Duplicate Samples
Appendix I Constituents & TSS

RPD = $\dfrac{\text{absolute value (a - b)}}{\text{(a + b)/2}} \times 100\%$

Acceptance Criteria*: 35%

* Unless otherwise noted in project planning documents, the acceptance criteria for field duplicates RPD is as follows:
- For analytes with concentrations greater than 5x (2x for soil matrices) the reporting limit, the RPD should be within 35% for water matrices (50% for soil matrices).
- For analytes with either or both concentrations less than 5x (2x for soil matrices) the reporting limit (indicated below by "low-level"), the absolute difference between the sample and field duplicate should not exceed 5x the reporting limit.

Duplicate Result Analysis:

Parameter	Unit	Parent	Duplicate Sample	RPD	Acceptable?
		MW-13_23_03	**FD-1_23_03**		
1,1-Dichloroethane	ug/L	2.01	1.97	low-level	Yes

ANALYTICAL REPORT

PREPARED FOR

Attn: Gina Wilming
Foth Infrastructure & Environment, LLC
411 6th Avenue SE
Suite 400
Cedar Rapids, Iowa 52401

Generated 9/11/2023 8:13:26 AM

JOB DESCRIPTION

CRLCSWA_1

JOB NUMBER

310-263235-1

Eurofins Cedar Falls
3019 Venture Way
Cedar Falls IA 50613

See page two for job notes and contact information.

Job Notes

This report may not be reproduced except in full, and with written approval from the laboratory. The results relate only to the samples tested. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

The test results in this report relate only to the samples as received by the laboratory and will meet all requirements of the methodology, with any exceptions noted. This report shall not be reproduced except in full, without the express written approval of the laboratory. All questions should be directed to the Eurofins Environment Testing North Central, LLC Project Manager.

Narrative

Job Narrative
310-263235-1

Receipt
The samples were received on 8/23/2023 4:15 PM. Unless otherwise noted below, the samples arrived in good condition, and, where required, properly preserved and on ice. The temperatures of the 5 coolers at receipt time were 2.1°C, 3.1°C, 3.5°C, 3.7°C and 4.8°C

GC/MS VOA
Method 8260D: The continuing calibration verification (CCV) associated with batch 310-397921 recovered outside control limits for 2-Hexanone (-21.9%D). The LCS associated with this CCV passes CCV criteria for the affected analytes; therefore, the data have been reported. The associated sample is impacted: (CCV 310-397921/3).

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

GC/MS Semi VOA
Method 8270E: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with preparation batch 310-397584.The laboratory control sample (LCS) was performed in duplicate (LCSD) to provide precision data for this batch.

Method 8270E: Surrogate recovery for the following sample was outside control limits: MW-37_23_08 (310-263235-5). Evidence of matrix interference is present; therefore, re-extraction and/or re-analysis was not performed.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Herbicides
No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Pesticides
Method 8081B: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with preparation batch 310-397585.The laboratory control sample (LCS) was performed in duplicate (LCSD) to provide precision data for this batch.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Metals
Method 6020B: The reference method requires samples to be preserved to a pH of <2. The following samples were received with insufficient preservation at a pH of >2: AW-4_23_08 (310-263235-2) and MW-13_23_08 (310-263235-3). The sample(s) was preserved to the appropriate pH in the laboratory.

Method 6020B: The low level check standard recovery associated with batch 310-398418 recovered above the upper control limit for Antimony. The samples associated with this standard were non-detects for the affected analytes; therefore, the data have been reported. The associated samples are impacted: MW-101A_23_08 (310-263235-9), MW-101B_23_08 (310-263235-10), MW-106A_23_08 (310-263235-11), MW-107A_23_08 (310-263235-12), MW-107B_23_08 (310-263235-13), FD-1_23_08 (310-263235-14) and FB-1_23_08 (310-263235-15).

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

General Chemistry
No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

GC/MS Semi VOA

Qualifier	Qualifier Description
S1+	Surrogate recovery exceeds control limits, high biased.

Metals

Qualifier	Qualifier Description
^3+	Reporting Limit Check Standard is outside acceptance limits, high biased
F1	MS and/or MSD recovery exceeds control limits.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

General Chemistry

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Accreditation/Certification Summary

Client: Foth Infrastructure & Environment, LLC
Job ID: 310-263235-1
Project/Site: CRLCSWA_1

Laboratory: Eurofins Cedar Falls

The accreditations/certifications listed below are applicable to this report.

Authority	Program	Identification Number	Expiration Date
Iowa	State	007	12-01-23

Laboratory: Eurofins Chicago

The accreditations/certifications listed below are applicable to this report.

Authority	Program	Identification Number	Expiration Date
Iowa	State	082	05-01-24

Method Summary

Client: Foth Infrastructure & Environment, LLC
Job ID: 310-263235-1
Project/Site: CRLCSWA_1

Method	Method Description	Protocol	Laboratory
8260D	Volatile Organic Compounds by GC/MS	SW846	EET CF
8270E	Semivolatile Organic Compounds (GC/MS)	SW846	EET CF
8081B	Organochlorine Pesticides (GC)	SW846	EET CF
8151A	Herbicides (GC)	SW846	EET CHI
6020B	Metals (ICP/MS)	SW846	EET CF
7470A	Mercury (CVAA)	SW846	EET CF
I-3765-85	Residue, Non-filterable (TSS)	USGS	EET CF
3005A	Preparation, Total Metals	SW846	EET CF
3510C	Liquid-Liquid Extraction (Separatory Funnel)	SW846	EET CF
5030B	Purge and Trap	SW846	EET CF
7470A	Preparation, Mercury	SW846	EET CF
8151A	Extraction (Herbicides)	SW846	EET CHI

310-263235 Chain of Custody

Cooler/Sample Receipt and Temperature Log Form

Client Information

Client: Foth

City/State: CR | STATE: IA | Project:

Receipt Information

Date/Time Received: DATE: 6-23-23 | TIME: 1615 | Received By: CC

Delivery Type: ☐ UPS ☐ FedEx ☐ FedEx Ground ☐ US Mail ☐ Spee-Dee
☒ Lab Courier ☐ Lab Field Services ☐ Client Drop-off ☐ Other: _____

Condition of Cooler/Containers

Sample(s) received in Cooler?	☒ Yes	☐ No	*If yes:* Cooler ID:
Multiple Coolers?	☒ Yes	☐ No	*If yes:* Cooler # 1 of 5
Cooler Custody Seals Present?	☒ Yes	☐ No	*If yes:* Cooler custody seals intact? ☒ Yes ☐ No
Sample Custody Seals Present?	☐ Yes	☒ No	*If yes:* Sample custody seals intact? ☐ Yes ☐ No
Trip Blank Present?	☐ Yes	☒ No	*If yes:* Which VOA samples are in cooler? ↓

Temperature Record

Coolant: ☒ Wet ice ☐ Blue ice ☐ Dry ice ☐ Other: _____ ☐ NONE

Thermometer ID: P | Correction Factor (°C): 0.0

• **Temp Blank Temperature** – If no temp blank, or temp blank temperature above criteria, proceed to Sample Container Temperature

Uncorrected Temp (°C): 3.7 | Corrected Temp (°C): 3.7

• **Sample Container Temperature**

	CONTAINER 1	CONTAINER 2
Container(s) used:		
Uncorrected Temp (°C):		
Corrected Temp (°C):		

Exceptions Noted

1) If temperature exceeds criteria, was sample(s) received same day of sampling? ☐ Yes ☐ No
   a) *If yes:* Is there evidence that the chilling process began? ☐ Yes ☐ No

2) If temperature is <0°C, are there obvious signs that the integrity of sample containers is compromised? (e.g., bulging septa, broken/cracked bottles, frozen solid?) ☐ Yes ☐ No

NOTE If yes, contact PM before proceeding If no, proceed with login

Additional Comments

Cooler/Sample Receipt and Temperature Log Form

Client Information

Client: Foth

City/State: CITY CR | STATE IA | Project:

Receipt Information

Date/Time Received: DATE 8-23-23 | TIME 1615 | Received By: CE

Delivery Type: ☐ UPS ☐ FedEx ☐ FedEx Ground ☐ US Mail ☐ Spee-Dee
☒ Lab Courier ☐ Lab Field Services ☐ Client Drop-off ☐ Other:_____

Condition of Cooler/Containers

Sample(s) received in Cooler?	☒ Yes	☐ No	*If yes:* Cooler ID:
Multiple Coolers?	☒ Yes	☐ No	*If yes:* Cooler # 2 of 5
Cooler Custody Seals Present?	☒ Yes	☐ No	*If yes:* Cooler custody seals intact? ☒ Yes ☐ No
Sample Custody Seals Present?	☐ Yes	☒ No	*If yes:* Sample custody seals intact? ☐ Yes ☐ No
Trip Blank Present?	☐ Yes	☒ No	*If yes:* Which VOA samples are in cooler? ↓

Temperature Record

Coolant: ☒ Wet ice ☐ Blue ice ☐ Dry ice ☐ Other:_____ ☐ NONE

Thermometer ID: P | Correction Factor (°C): 0.0

• **Temp Blank Temperature** – If no temp blank, or temp blank temperature above criteria, proceed to Sample Container Temperature

Uncorrected Temp (°C): 3.1 | Corrected Temp (°C): 3.1

• **Sample Container Temperature**

	CONTAINER 1	CONTAINER 2
Container(s) used:		
Uncorrected Temp (°C):		
Corrected Temp (°C):		

Exceptions Noted

1) If temperature exceeds criteria, was sample(s) received same day of sampling? ☐ Yes ☐ No
   a) *If yes:* Is there evidence that the chilling process began? ☐ Yes ☐ No

2) If temperature is <0°C, are there obvious signs that the integrity of sample containers is compromised? (e.g., bulging septa, broken/cracked bottles, frozen solid?) ☐ Yes ☐ No

NOTE If yes, contact PM before proceeding If no, proceed with login

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	N/A	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

Job Notes

This report may not be reproduced except in full, and with written approval from the laboratory. The results relate only to the samples tested. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

The test results in this report relate only to the samples as received by the laboratory and will meet all requirements of the methodology, with any exceptions noted. This report shall not be reproduced except in full, without the express written approval of the laboratory. All questions should be directed to the Eurofins Environment Testing North Central, LLC Project Manager.

Narrative

Job Narrative
310-263470-1

Analytical test results meet all requirements of the associated regulatory program listed on the Accreditation/Certification Summary Page unless otherwise noted under the individual analysis. Data qualifiers are applied to indicate exceptions. Noncompliant quality control (QC) is further explained in narrative comments.

Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD may be performed, unless otherwise specified in the method.
Surrogate and/or isotope dilution analyte recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in the narrative.

Regulated compliance samples (e.g. SDWA, NPDES) must comply with the associated agency requirements/permits.

Receipt
The samples were received on 8/25/2023 10:10 AM. Unless otherwise noted below, the samples arrived in good condition, and, where required, properly preserved and on ice. The temperatures of the 3 coolers at receipt time were 2.2°C, 2.9°C and 4.0°C

GC/MS VOA
Method 8260D: The continuing calibration verification (CCV) associated with batch 310-397921 recovered outside control limits for 2-Hexanone (-21.9%D). The LCS associated with this CCV passes CCV criteria for the affected analytes; therefore, the data have been reported. The associated sample is impacted: (CCV 310-397921/3).

Method 8260D: The continuing calibration verification (CCV) associated with batch 310-398038 recovered above the upper control limit for Vinyl chloride (23.9%D). The LCS associated with this CCV passed CCV criteria for the affected analytes; therefore, the data have been reported. The associated sample is impacted: (CCV 310-398038/4).

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

GC/MS Semi VOA
Method 8270E: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with preparation batch 310-397915.The laboratory control sample (LCS) was performed in duplicate (LCSD) to provide precision data for this batch.

Method 8270E: Surrogate recovery for the following sample was outside of acceptance limits due to B/N only extraction: FB-2_23_08 (310-263470-12). Only the B/N analytes will be reported.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Herbicides
No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Pesticides
Method 8081B: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with preparation batch 310-397899.The laboratory control sample (LCS) was performed in duplicate (LCSD) to provide precision data for this batch.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Metals
No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

General Chemistry

Job ID: 310-263470-1 (Continued)

Laboratory: Eurofins Cedar Falls (Continued)

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Metals

Qualifier	Qualifier Description
^+	Continuing Calibration Verification (CCV) is outside acceptance limits, high biased.
B	Compound was found in the blank and sample.
F1	MS and/or MSD recovery exceeds control limits.
F5	Duplicate RPD exceeds limit, and one or both sample results are less than 5 times RL, and the absolute difference between results is < the upper reporting limits for both.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

General Chemistry

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Cooler/Sample Receipt and Temperature Log Form

Client Information				
Client:			Foth	
City/State:	CITY	STATE	IA	Project:
Receipt Information				
Date/Time Received:	DATE 8/25/23	TIME 1430		Received By: SL
Delivery Type: ☐ UPS ☐ FedEx ☐ FedEx Ground ☐ US Mail ☐ Spee-Dee				
☑ Lab Courier ☐ Lab Field Services ☐ Client Drop-off ☐ Other:_____				
Condition of Cooler/Containers				
Sample(s) received in Cooler? ☑ Yes ☐ No			*If yes:* Cooler ID:	
Multiple Coolers? ☑ Yes ☐ No			*If yes:* Cooler # 1 of 3	
Cooler Custody Seals Present? ☑ Yes ☐ No			*If yes.* Cooler custody seals intact? ☐ Yes ☐ No	
Sample Custody Seals Present? ☐ Yes ☑ No			*If yes:* Sample custody seals intact? ☐ Yes ☐ No	
Trip Blank Present? ☐ Yes ☑ No			*If yes:* Which VOA samples are in cooler? ↓	
Temperature Record				
Coolant: ☑ Wet ice ☐ Blue ice ☐ Dry ice ☐ Other:_____ ☐ NONE				
Thermometer ID: R			Correction Factor (°C): 0	
• **Temp Blank Temperature** – If no temp blank, or temp blank temperature above criteria, proceed to Sample Container Temperature				
Uncorrected Temp (°C): 2.9			Corrected Temp (°C): 2.9	
• **Sample Container Temperature**				
Container(s) used:	CONTAINER 1		CONTAINER 2	
Uncorrected Temp (°C):				
Corrected Temp (°C):				
Exceptions Noted				
1) If temperature exceeds criteria, was sample(s) received same day of sampling? ☐ Yes ☐ No				
a) *If yes:* Is there evidence that the chilling process began? ☐ Yes ☐ No				
2) If temperature is <0°C, are there obvious signs that the integrity of sample containers is compromised? (e g., bulging septa, broken/cracked bottles, frozen solid?) ☐ Yes ☐ No				
NOTE If yes, contact PM before proceeding If no, proceed with login

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	N/A	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

Job Notes

This report may not be reproduced except in full, and with written approval from the laboratory. The results relate only to the samples tested. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

The test results in this report relate only to the samples as received by the laboratory and will meet all requirements of the methodology, with any exceptions noted. This report shall not be reproduced except in full, without the express written approval of the laboratory. All questions should be directed to the Eurofins Environment Testing North Central, LLC Project Manager.

Narrative

Job Narrative
310-263688-1

Analytical test results meet all requirements of the associated regulatory program listed on the Accreditation/Certification Summary Page unless otherwise noted under the individual analysis. Data qualifiers are applied to indicate exceptions. Noncompliant quality control (QC) is further explained in narrative comments.

Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD may be performed, unless otherwise specified in the method.
Surrogate and/or isotope dilution analyte recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in the narrative.

Regulated compliance samples (e.g. SDWA, NPDES) must comply with the associated agency requirements/permits.

Receipt
The samples were received on 8/30/2023 4:25 PM. Unless otherwise noted below, the samples arrived in good condition, and, where required, properly preserved and on ice. The temperatures of the 6 coolers at receipt time were 0.9°C, 1.5°C, 2.1°C, 2.3°C, 2.4°C and 2.8°C

GC/MS VOA
Method 8260D: Surrogate recovery for the following sample was outside the upper control limit: MW-20_23_08 (310-263688-8). This sample did not contain any target analytes; therefore, re-extraction and/or re-analysis was not performed.

Method 8260D: The continuing calibration verification (CCV) associated with batch 310-398344 recovered above the upper control limit for 1,1,2,2-Tetrachloroethane (22.6%D). The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported. The associated sample is impacted: (CCV 310-398344/3).

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

GC/MS Semi VOA
No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Herbicides
Method 8151A: Surrogate recovery for the following sample was outside the upper control limit: AW-6_23_08 (310-263688-3). This sample did not contain any target analytes; therefore, re-extraction and/or re-analysis was not performed.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Pesticides
No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Metals
Method 6020B: The reference method requires samples to be preserved to a pH of <2. The following samples were received with insufficient preservation at a pH of >2: CRL-9_23_08 (310-263688-4) and MW-32_23_08 (310-263688-13). The sample(s) was preserved to the appropriate pH in the laboratory.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

General Chemistry
No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Surrogate	%Recovery	Qualifier	Limits	Prepared	Analyzed	Dil Fac
Dibromofluoromethane (Surr)	97		80 - 128		09/01/23 02:38	1
Toluene-d8 (Surr)	100		80 - 120		09/01/23 02:38	1
4-Bromofluorobenzene (Surr)	103		80 - 120		09/01/23 02:38	1

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
S1+	Surrogate recovery exceeds control limits, high biased.

GC Semi VOA

Qualifier	Qualifier Description
S1+	Surrogate recovery exceeds control limits, high biased.

Metals

Qualifier	Qualifier Description
F1	MS and/or MSD recovery exceeds control limits.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Date/Time Received: DATE 8-30 23 | TIME 1625 | Received By: MC

Delivery Type: ☐ UPS ☐ FedEx ☐ FedEx Ground ☐ US Mail ☐ Spee-Dee
☒ Lab Courier ☐ Lab Field Services ☐ Client Drop-off ☐ Other:_____

Condition of Cooler/Containers

Sample(s) received in Cooler? ☒ Yes ☐ No *If yes:* Cooler ID:

Multiple Coolers? ☒ Yes ☐ No *If yes:* Cooler # 1 of 6

Cooler Custody Seals Present? ☒ Yes ☐ No *If yes:* Cooler custody seals intact? ☒ Yes ☐ No

Sample Custody Seals Present? ☐ Yes ☒ No *If yes:* Sample custody seals intact? ☐ Yes ☐ No

Trip Blank Present? ☒ Yes ☐ No *If yes:* Which VOA samples are in cooler? ↓

FB-3_23-08

Temperature Record

Coolant: ☒ Wet ice ☐ Blue ice ☐ Dry ice ☐ Other:_____ ☐ NONE

Thermometer ID: T | Correction Factor (°C): 0

• **Temp Blank Temperature** – If no temp blank, or temp blank temperature above criteria, proceed to Sample Container Temperature

Uncorrected Temp (°C): 2.8 | Corrected Temp (°C): 2.8

• **Sample Container Temperature**

	CONTAINER 1	CONTAINER 2
Container(s) used:		
Uncorrected Temp (°C):		
Corrected Temp (°C):		

Exceptions Noted

1) If temperature exceeds criteria, was sample(s) received same day of sampling? ☐ Yes ☐ No
   a) *If yes:* Is there evidence that the chilling process began? ☐ Yes ☐ No

2) If temperature is <0°C, are there obvious signs that the integrity of sample containers is compromised? (e.g., bulging septa, broken/cracked bottles, frozen solid?) ☐ Yes ☐ No

NOTE: If yes, contact PM before proceeding. If no, proceed with login

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	N/A	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

Job Notes

This report may not be reproduced except in full, and with written approval from the laboratory. The results relate only to the samples tested. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

The test results in this report relate only to the samples as received by the laboratory and will meet all requirements of the methodology, with any exceptions noted. This report shall not be reproduced except in full, without the express written approval of the laboratory. All questions should be directed to the Eurofins Environment Testing North Central, LLC Project Manager.

Narrative

Job Narrative
310-263793-1

Analytical test results meet all requirements of the associated regulatory program listed on the Accreditation/Certification Summary Page unless otherwise noted under the individual analysis. Data qualifiers are applied to indicate exceptions. Noncompliant quality control (QC) is further explained in narrative comments.

Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD may be performed, unless otherwise specified in the method.
Surrogate and/or isotope dilution analyte recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in the narrative.

Regulated compliance samples (e.g. SDWA, NPDES) must comply with the associated agency requirements/permits.

Receipt
The samples were received on 8/31/2023 3:30 PM. Unless otherwise noted below, the samples arrived in good condition, and, where required, properly preserved and on ice. The temperatures of the 2 coolers at receipt time were 2.8°C and 3.7°C

GC/MS VOA
Method 8260D: The following samples were collected in a properly preserved vial; however, the pH was outside the required criteria when verified by the laboratory. The sample was analyzed within the 7-day holding time specified for unpreserved samples: (310-263774-E-1).

Method 8260D: The continuing calibration verification (CCV) associated with batch 310-398436 recovered outside control limits for Chloroethane (-21.5%D). The LCS associated with this CCV passes CCV criteria for the affected analytes; therefore, the data have been reported. The associated sample is impacted: (CCV 310-398436/4).

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

GC/MS Semi VOA
Method 8270E: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with preparation batch 310-398448.The laboratory control sample (LCS) was performed in duplicate (LCSD) to provide precision data for this batch.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Herbicides
No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Pesticides
Method 8081B: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with preparation batch 310-398396.The laboratory control sample (LCS) was performed in duplicate (LCSD) to provide precision data for this batch.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Metals
Method 6020B: The reference method requires samples to be preserved to a pH of <2. The following sample was received with insufficient preservation at a pH of >2: MW-22_23_08 (310-263793-1). The sample(s) was preserved to the appropriate pH in the laboratory.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

General Chemistry

Job ID: 310-263793-1 (Continued)

Laboratory: Eurofins Cedar Falls (Continued)

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Metals

Qualifier	Qualifier Description
4	MS, MSD: The analyte present in the original sample is greater than 4 times the matrix spike concentration; therefore, control limits are not applicable.
F1	MS and/or MSD recovery exceeds control limits.
F2	MS/MSD RPD exceeds control limits
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

General Chemistry

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Cooler/Sample Receipt and Temperature Log Form

Client Information

Client: Foth

City/State: CITY | STATE: IA | Project:

Receipt Information

Date/Time Received: DATE: 8/31/23 | TIME: 1530 | Received By: SL

Delivery Type: ☐ UPS ☐ FedEx ☐ FedEx Ground ☐ US Mail ☐ Spee-Dee
☐ Lab Courier ☐ Lab Field Services ☑ Client Drop-off ☐ Other:_____

Condition of Cooler/Containers

Sample(s) received in Cooler? ☑ Yes ☐ No *If yes:* Cooler ID:

Multiple Coolers? ☑ Yes ☐ No *If yes:* Cooler # 1 of 2

Cooler Custody Seals Present? ☐ Yes ☑ No *If yes:* Cooler custody seals intact? ☐ Yes ☐ No

Sample Custody Seals Present? ☐ Yes ☑ No *If yes:* Sample custody seals intact? ☐ Yes ☐ No

Trip Blank Present? ☑ Yes ☑ No *If yes:* Which VOA samples are in cooler? ↓

MW-24, 25, 102-B, 108B
FD-5

Temperature Record

Coolant: ☑ Wet ice ☐ Blue ice ☐ Dry ice ☐ Other:_____ ☐ NONE

Thermometer ID: P | Correction Factor (°C): 0

• **Temp Blank Temperature** – If no temp blank, or temp blank temperature above criteria, proceed to Sample Container Temperature

Uncorrected Temp (°C): 3.7 | Corrected Temp (°C): 3.7

• **Sample Container Temperature**

	CONTAINER 1	CONTAINER 2
Container(s) used:		
Uncorrected Temp (°C):		
Corrected Temp (°C):		

Exceptions Noted

1) If temperature exceeds criteria, was sample(s) received same day of sampling? ☐ Yes ☐ No
   a) *If yes:* Is there evidence that the chilling process began? ☐ Yes ☐ No

2) If temperature is <0°C, are there obvious signs that the integrity of sample containers is compromised? (e.g., bulging septa, broken/cracked bottles, frozen solid?) ☐ Yes ☐ No

NOTE. If yes, contact PM before proceeding. If no, proceed with login

Data Validation Report

Project Name:	CRLCSWA Site 1 – Cedar Rapids, IA (23C071.00)
Task Name:	23C071_23_08
Data Set Description:	Fall 2023 Groundwater Event
Laboratory(s):	Eurofins – Cedar Falls, IA and Chicago, IL
Laboratory Sample Delivery Group (SDG) ID(s):	310-263235-1; 310-263470-1; 310-263688-1; 310-263793-1
Sample Collection Dates:	8/21/2023 – 8/30/2023
Sample Analysis Dates:	8/24/2023 – 9/21/2023
Sample Matrices:	Groundwater
Sample IDs Reviewed:	See Table 1
Verification and Validation Stage, 100% data:	☐ 1 ☒ 2A ☐ 2B ☐ 3 ☐ 4
Verified and Validated By:	Hannah Dubbs, Project Environmental Scientist 11/8/2023

The analytical data were validated to verify that laboratory quality assurance and quality control (QA/QC) procedures were documented and to evaluate the overall quality of the data reported. Analytical reports include 47 investigative groundwater samples collected via low-flow or no-purge sampling techniques at the Cedar Rapids Linn County Solid Waste Agency (CRLCSWA) Site 1 from August 21 to 30, 2023; samples are listed in Table 1. The data were collected in accordance with the *Hydrologic Monitoring System Plan* (HRG, 2006), Iowa Department of Natural Resources (IDNR) Sanitary Disposal Closure Permit Number 57-SDP-03-75C (including Amendments), and 567 Iowa Administrative Code (IAC) 113.10.

Validation Summary

Stage 2A data validation was performed on 100% of the data from these SDGs, with review tasks and items of note documented in the summary table below.

Validation Task and Description	Review Notes	Action
Chain of Custody (COC) and Sample Receipt Form Confirm relinquish & receipt signatures. Confirm parameters and analytical methods match COC and Hydrologic Monitoring System Plan (HMSP).	All appropriate relinquish and receipt signatures were present. Eurofins inadvertently labeled sample MW-11_23_08 with a space (MW- 11_23_08) in laboratory report 310-263470-1. Foth did not request a revised report. The sample name will be corrected in the laboratory electronic data deliverable (EDD) prior to data upload. Parameters and analytical methods analyzed match the COC and current sampling program with the following exception. Eurofins inadvertently omitted the acid Semivolatile Organic Compounds (SVOCs) for FB-2_23_08 during the extraction process. Eurofins contacted Foth, and Foth instructed Eurofins not to re-prep FB-2_23_08 since it would be outside of hold time. Base/neutral SVOCs were prepped and analyzed within hold times and reported. Resampling is not recommended because FB-2_23_08 is a quality control sample.	Mislabeled sample ID will be updated in the lab EDD prior to data upload. Not applicable

Validation Task and Description	Review Notes	Action
Case Narrative Review for items noted by the laboratory that may impact the validation process.	The quality control issues noted in the case narratives were reviewed and found acceptable. Issues either were addressed in the comments below, had no impact on investigative samples, or were corrected/qualified by the laboratory. No additional actions are required. Note: continuing calibration verification (CCV) evaluation is not part of Stage 2A validation.	Not applicable
Sample Condition Upon Receipt Confirm samples in acceptable condition and no discrepancies noted. Confirm preservation meets method requirements.	With the exception identified below, samples were received by Eurofins – Cedar Falls, IA in acceptable conditions. In addition, the sulfide sample shipment from Eurofins – Cedar Falls, IA to Eurofins – Chicago, IL were received in acceptable conditions. The total metals containers for AW-4_23_08 and MW-13_23_08 (310-263235-1), CRL-9_23_08 and MW-32_23_08 (310-263688-1), and MW-22_23_08 (310-263793-1) were received with a pH greater than (>) 2, and Eurofins adjusted the pH to less than (<) 2 upon receipt. In accordance with the *National Functional Guidelines for Inorganic Superfund Methods Data Review* (USEPA, 2020b), Inductively Coupled Plasma Mass Spectrometry (ICP-MS) metals samples adjusted to a pH <2 by the laboratory do not require qualification.	No qualifiers assigned
Methods Requested Confirm methods match project requirements and lab provided all methods ordered.	The methods ordered and analyzed were performed in accordance with the project requirements. Methods include United States Environmental Protection Agency (USEPA) 8260D Volatile Organic Compounds (VOCs), USEPA 8270E SVOCs, USEPA 8151A Herbicides, USEPA 8081B Organochlorine Pesticides, USEPA 6020B Total Metals, USEPA 7470A Total Mercury, and United States Geological Survey (USGS) I-3765-85 Total Suspended Solids.	Not applicable
Analytes Requested Confirm analytes ordered match project requirements and lab provided all analytes ordered.	The analytes requested were analyzed in accordance with the project requirements. The laboratory provided analytes ordered with the exception of acid SVOCs in FB-2_23_08.	Not applicable
Holding Times Confirm laboratory performed extractions and analyses within method-required holding times.	Eurofins performed analysis within the method-required holding times.	Not applicable
Blanks Confirm no detections in laboratory method blanks, field blanks, and trip blanks.	Table 3 presents analytes detected in the method, field, and trip blanks. No detections were found in the trip blanks. Qualifiers are assigned in Table 9. Zinc was detected in the method blank (MB 310-397966/1-A) at a concentration of 0.008738 J milligrams per liter (mg/L). In accordance with the *National Functional Guidelines for Inorganic Superfund Methods Data Review* (USEPA, 2020b) for ICP-MS metals, when the blank contamination concentration is J-flagged, associated non-detect sample results are not qualified, associated J-flagged sample results are assigned a U qualifier and reported at the practical quantitation limit (PQL), and detections (> PQL) are	Qualifiers assigned

Validation Task and Description	Review Notes	Action
Blanks Continued	qualified J+ or no qualification. Professional judgment was used to not assign qualifiers to the zinc data for MW-16_23_08 and FD-2_23_08 since the potential high bias contributed by the blank contamination was minor compared to the concentration identified in the sample results. Toluene was detected in the field blank (FB-3_23_08) at a concentration of 0.489 J ug/L. In accordance with the *National Functional Guidelines for Organic Superfund Methods Data Review* (USEPA, 2020a) for VOCs, when the blank contamination concentration is J-flagged, associated non-detect sample results are not qualified and associated J-flagged sample results are assigned a U qualifier and reported at the PQL.	Qualifiers assigned
Surrogates or Deuterated Monitoring Compounds For *organic analyses only*, confirm surrogates analyzed and surrogate recovery within QC limits.	Table 4 presents surrogate recoveries that were outside the control limits. <u>310-263235-1</u> The nitrobenzene-d5 base/neutral surrogate recovery for MW-37_23_08 was above the upper acceptance limit, indicating potential high bias for the base/neutral SVOC compounds in MW-37_22_08. In accordance with the *National Functional Guidelines for Organic Superfund Methods Data Review* (USEPA, 2020a) for SVOCs, when base/neutral SVOC surrogate recovery is above the upper acceptance limit, non-detect base/neutral SVOC results in the parent sample are not qualified. <u>310-263470-1</u> Surrogate recoveries were within control limits for this SDG. <u>310-263688-1</u> The 4-bromofluorobenzene surrogate recovery for MW-20_23_08 was above the upper acceptance limit, indicating potential high bias for the VOC results in MW-20_23_08. In accordance with the *National Functional Guidelines for Organic Superfund Methods Data Review* (USEPA, 2020a), when VOC recovery is above the upper acceptance limit, non-detect VOC results in the parent sample are not qualified. The DCAA surrogate recovery for AW-6_23_08 was above the upper acceptance limit, indicating potential high bias for the herbicide results in AW-6_23_08. In accordance with the *National Functional Guidelines for Organic Superfund Methods Data Review* (USEPA, 2020a), when herbicide surrogate recovery is above the expanded upper acceptance limit, professional judgment shall be utilized. Professional judgment was utilized not to qualify the non-detect herbicide in AW-6_23_08 since the potential bias was high and the result was non-detect. <u>310-263793-1</u> Surrogate recoveries were within control limits for this SDG.	No qualifiers assigned Not applicable No qualifiers assigned No qualifiers assigned Not applicable

Validation Task and Description	Review Notes	Action
Matrix Spike/Matrix Spike Duplicates (MS/MSD) Confirm MS/MSDs analyzed at frequency specified by project requirements and MS/MSD percent recovery within lab specified limits. Confirm, for Organic analytes, MSD relative percent difference (RPD) within limits. For inorganic analytes, lab replicate RPD within limits.	MS/MSD quality control samples are not required for this project. As a result, no MS/MSD samples were collected or submitted for analysis. Where analyzed and reported by the laboratory, MS/MSD results associated with the samples in 310-263235-1, 310-263470-1, 310-263688-1, and 310-263793-1 are reviewed under Stage 2A validation guidelines. Table 5 presents MS/MSD recoveries and RPDs that were outside the control limits. Qualifiers are assigned in Table 9. <u>310-263235-1</u> MS/MSD recoveries and RPDs were within control limits for this SDG.	Not applicable
	<u>310-263470-1</u> The MS recovery for thallium associated with AW-3_23_08 was below the recovery limit (75%-125%), indicating potential low bias. However, MSD recovery for thallium associated with AW-3_23_08 was within the recovery limit. In accordance with the *National Functional Guidelines for Inorganic Superfund Methods Data Review* (USEPA, 2020b) for ICP-MS metals, when the MS recovery is 30 – 74% and MSD recovery is greater than or equal to (≥) 75%, associated non-detects are qualified UJ.	Not applicable
	<u>310-263688-1</u> The MS recovery for antimony associated with AW-1_23_08 was above the recovery limit (75%-125%), indicating potential high bias. However, MSD recovery for antimony associated with AW-1_23_08 was within the recovery limit. In accordance with the *National Functional Guidelines for Inorganic Superfund Methods Data Review* (USEPA, 2020b) for ICP-MS metals, when the MS recovery is >75% and MSD recovery is less than or equal to (≤) 125%, associated non-detects are not qualified.	No qualifier assigned
	The MS/MSD recoveries for thallium associated with AW-1_23_08 were below the recovery limit (75%-125%), indicating potential low bias. In accordance with the *National Functional Guidelines for Inorganic Superfund Methods Data Review* (USEPA, 2020b) for ICP-MS metals, when the MS recovery is 30 – 74% and MSD recovery is <75%, associated detects are qualified J-.	Qualifier assigned
	<u>310-263793-1</u> The MS/MSD recoveries for barium associated with MW-24_23_08 were below the recovery limit (75%-125%); however, the sample concentration was ≥ 4x the spike added. In accordance with the *National Functional Guidelines for Inorganic Superfund Methods Data Review* (USEPA, 2020b) for ICP-MS metals, spike recovery limits do not apply when the sample concentration is ≥ 4x the spike added and data are reported unqualified even if the %R does not meet the acceptance criteria.	No qualifier assigned

Validation Task and Description	Review Notes	Action
MS/MSD Continued	The MS/MSD RPD for tin associated with MW-24_23_08 was above the control limit, indicating a potential estimated value. In accordance with the *National Functional Guidelines for Inorganic Superfund Methods Data Review* (USEPA, 2020b) for ICP-MS metals, when the RPD is above the control limit (>20) associated non-detects are not qualified. The MS/MSD recoveries for thallium associated with MW-24_23_08 were below the recovery limit (75%-125%), indicating potential low bias. In accordance with the *National Functional Guidelines for Inorganic Superfund Methods Data Review* (USEPA, 2020b) for ICP-MS metals, when the MS recovery is 30 – 74% and MSD recovery is <75%, associated detects are qualified J-.	No qualifier assigned Qualifiers assigned
Laboratory Control Sample/Laboratory Control Sample Duplicates (LCS/LCSDs) Confirm LCS analyzed and LCS/LCSD recovery and RPD within lab specified limits.	LCS/LCSD quality control samples are not required for this project. Where analyzed and reported by the laboratory, LCS/LCSD results associated with method batches in 310-263235-1, 310-263470-1, 310-263688-1, and 310-263793-1 are reviewed under Stage 2A validation guidelines. Table 6 is intended to present the LCS/LCSD recoveries and RPDs that were outside the control limits. LCS/LCSD recoveries were within control limits and LCS/LCSD RPDs were below control limits for this SDG.	Not applicable
Laboratory Duplicates Confirm lab duplicates analyzed and RPD within lab specified limits.	Laboratory duplicate quality control samples are not required for this project. Where analyzed and reported by the laboratory, laboratory duplicate results associated with the samples in 310-263235-1, 310-263470-1, 310-263688-1, and 310-263793-1 are reviewed under Stage 2A validation guidelines. Table 7 presents the lab duplicate sample RPDs that were outside the RPD limits. Qualifiers are assigned in Table 9. The laboratory duplicate RPD for zinc associated with FD-2_23_08 was above the upper acceptance limit. In accordance with the *National Functional Guidelines for Inorganic Superfund Methods Data Review* (USEPA, 2020b) for ICP-MS metals, when the laboratory duplicate RPD is above the upper acceptance limit, detects are qualified J.	Qualifier assigned
Field Duplicates Confirm field duplicates collected at required frequency and field duplicate RPD within acceptable limits.	Field duplicate samples were collected at a 1 per 10 frequency in accordance with the project requirements. Table 8 contains the precision evaluation of the parent/field duplicate samples. The RPDs between the investigative and field duplicate samples were within the duplicate sample validation criteria.	Not applicable

Abbreviations:
> = greater than
≥ = greater than or equal to
< = less than
CCV = continuing calibration verification
COC = chain of custody
EDD = electronic data deliverable

Abbreviations:
HMSP = Hydrologic Monitoring System Plan
ICP-MS = inductively coupled plasma mass spectrometry
mg/L = milligram per liter
LCS = laboratory control sample
LCSD = laboratory control sample duplicate
MS = matrix spike
MSD = matrix spike duplicate
PQL = Practical Quantification Limit
QA = quality assurance
QC = quality control
RPD = relative percent difference
SCUR = sample condition upon receipt
SDG = sample delivery group
SVOC = semivolatile organic compound
ug/L = microgram per liter
USEPA = United States Environmental Protection Agency
USGS = United States Geological Survey
VOC = volatile organic compound

Overall Assessment of Data

Item	Acceptable		Comments
	Yes	No	
1. Method Criteria	X		Samples were collected, preserved, shipped/delivered, and analyzed within the method protocols, except for SVOCs at FB-2_23_08. Eurofins inadvertently omitted the acid SVOCs for FB-2_23_08 during the extraction process. Eurofins contacted Foth, and Foth instructed Eurofins not to re-prep FB-2_23_08 since it would be outside of hold time. Base/neutral SVOCs were prepped and analyzed within hold times and reported. Resampling is not recommended because FB-2_23_08 is a quality control sample.
2. Precision	X		Field precision was evaluated through investigative and field duplicate RPDs. The RPDs between the investigative and field duplicate samples were within the duplicate sample validation criteria. Laboratory precision was evaluated through MS/MSD, LCS/LCSD, and laboratory duplicate RPDs. Where analyzed and reported by the laboratory, LCS/LCSD RPDS were within control limits. With the exceptions identified below, MS/MSD and laboratory duplicate RPDs were within control limits. As listed in Table 5, an MS/MSD RPD exceedance was identified for tin associated with MW-24_22_08. A qualifier was not assigned since the associated result was non-detect. As listed in Table 7, a laboratory duplicate RPD exceedance was identified for zinc associated with FD-2_23_08. A J qualifier was assigned since the associated result was >PQL.
3. Accuracy	X		Accuracy was evaluated through surrogate, MS/MSD, and LCS/LCD recovery. Where analyzed and reported by the laboratory, LCS/LCSD recoveries were within control limits. The % recoveries for surrogates or MS/MSD samples were within control limits with the exceptions listed in Tables 4 and 5. The accuracy impacts on individual results were relatively low compared to the total number of results analyzed, and, in many cases,

Item	Acceptable		Comments
	Yes	No	
			qualifiers were not assigned since the associated results were non-detect. The qualifiers assigned due to surrogate and MS/MSD recovery exceedances are summarized in Table 9.
4. Representativeness	X		Sampling was conducted in accordance with the sample collection procedures described in the approved HMSP, approved HMSP revisions, and SOPs.
5. Comparability	X		Collection techniques, measurement procedures, methods, and reporting were equivalent to currently approved procedures and are comparable to historical data.
6. Completeness	X		Valid analytical results exceeded 90%.
7. Suitability for Intended Use	X		No evidence of gross contamination or significant issues with the method criteria, precision, accuracy, representativeness, comparability, or completeness were identified.

Overall, the data reported are of good quality and the results for the QA/QC measurements that were used by the laboratories during the analysis of the samples were generally acceptable. Some sample results required qualification during data validation because method-specific QA/QC criteria were not met; results may be qualified for more than one reason. Qualified data are usable (unless qualified as rejected [R]), represent data of good quality and reasonable confidence, and have an acceptable degree of uncertainty (i.e., may be less precise or less accurate than unqualified data). Table 2 provides a definition of the qualifiers that may be assigned by the validator and/or retained from the laboratory. A summary of the validation qualifiers is provided below.

- No results were qualified as biased high (assigned as J+ qualifiers), non-detect with the reporting limit an estimated value (assigned UJ+, or UJ- qualifiers), presumptive evidence of presence of an analyte (assigned as N or NJ qualifiers), or not usable and rejected (assigned as R qualifier).
- One result (0.03%) was qualified as estimated (assigned as J).
- Two results (0.05%) were qualified as biased low (assigned as J-).
- Five results (0.13%) were qualified as non-detect at a concentration less than the reporting limit or less than the sample result (assigned as U).
- One result (0.03%) was qualified as non-detect with the reporting limit an estimated value (assigned as UJ).
- 100% of the reported data is usable for project data quality objectives.

Table 2
Explanation of Qualifiers

Qualifier	Explanation
U	The analyte was analyzed for and was not detected above the numerical quantitation limit.
J	The analyte was analyzed for and was positively identified, but the analytical result (i.e., quantitation) is an estimated value. In some cases it is recognized that the estimated value is biased high (J+) suggesting the actual value is lower than estimated; or biased low (J-) suggesting the actual value is higher than estimated.
UJ	The analyte was analyzed for and was not detected above the reporting limit, but the reporting limit is an estimated value.
R	The analyte was analyzed for but may or may not be present and/or quantifiable due to quality control issues. The analytical result is not usable and should be rejected.
N	The analysis indicates presumptive evidence of the presence of the analyte.
NJ	The analysis indicates presumptive evidence of the presence of the analyte, but the numerical value is an estimated quantity.

Notes:
Results qualified as "J" or "UJ" are of acceptable data quality and may be used quantitatively per United States Environmental Protection Agency guidelines.

Table 3
Method, Field, and Trip Blank Exceedances

Lab Report	Blank Type	Lab Sample ID	Analysis Batch	Prep Batch	Parameter	Result	Units	Lab Qualifier	MDL	PQL	Associated Samples

RPD = relative percent difference

Table 8
Relative Percent Difference (RPD) Analysis for Field Duplicate Samples
Appendix I Constituents & TSS

RPD = $\dfrac{\text{absolute value (a - b)}}{\text{(a + b)/2}} \times 100\%$

Acceptance Criteria*: 35%

* Unless otherwise noted in project planning documents, the acceptance criteria for field duplicates RPD is as follows:
- For analytes with concentrations greater than 5x (2x for soil matrices) the reporting limit, the RPD should be within 35% for water matrices (50% for soil matrices).
- For analytes with either or both concentrations less than 5x (2x for soil matrices) the reporting limit (indicated below by "low-level"), the absolute difference between the sample and field duplicate should not exceed 5x the reporting limit.

Cadmium	mg/L	J 0.000162	< 0.000100	low-level	Yes
Cobalt	mg/L	J 0.000175	< 0.000170	low-level	Yes
Lead	mg/L	0.000600	J 0.000244	low-level	Yes
Silver	mg/L	J 0.000911	< 0.000500	low-level	Yes

Table 8
Relative Percent Difference (RPD) Analysis for Field Duplicate Samples
Appendix I Constituents & TSS

RPD = $\frac{\text{absolute value (a - b)}}{\text{(a + b)/2}}$ **x 100%**

Acceptance Criteria*: 35%

* Unless otherwise noted in project planning documents, the acceptance criteria for field duplicates RPD is as follows:
- For analytes with concentrations greater than 5x (2x for soil matrices) the reporting limit, the RPD should be within 35% for water matrices (50% for soil matrices).
- For analytes with either or both concentrations less than 5x (2x for soil matrices) the reporting limit (indicated below by "low-level"), the absolute difference between the sample and field duplicate should not exceed 5x the reporting limit.

Duplicate Result Analysis:

Parameter	Unit	Parent	Duplicate Sample	RPD	Acceptable?
		MW-25_23_08	FD-5_23_08		
Thallium	mg/L	0.00307	< 0.000260	low-level	Yes
Total Suspended Solids	mg/L	3.13	2.00	low-level	Yes

Table 9
Qualified Results from Data Validation

Sample ID	Lab Sample ID	Method	Parameter	Result	Lab Qualifier	Units	Qualified Result	Validator Qualifier	Explanation
AW-3_23_08	310-263470-1	USEPA 6020B	Zinc	0.00861	J	mg/L	<0.02	U	MB detection >MDL and <PQL; qualified U and reported at PQL since result is >MDL and <PQL.

RE: Site 1 Statistical Analysis - Spring 2023 Evaluation

1 Memorandum Organization

This memo addresses the statistical analysis of the groundwater monitoring data collected in January and March 2023. The statistical methods and results are summarized, with the memo organization given as follows:

Page
1 Memorandum Organization 1
2 Background 2
3 Statistical Methodology 4
3.1 Background Data Set Adjustments 5
3.1.1 Adjustments Associated with Turbidity and Total Suspended Solids 5
3.1.2 Adjustments Associated with Practical Quantitation Limits 5

2 Background

The groundwater monitoring locations and status of the Appendix I and II sampling schedules are summarized in Tables 1 and 2. The Appendix I and II analytical results will be provided in Table 14 of the 2023 Annual Water Quality Report (AWQR).

Table 1
Upper Bedrock Monitoring Locations and Schedule [1]
Aug. 2008 – Mar. 2023 Appendix I & II Data

Monitoring Location	Monitoring Program	Current Schedule [2] (Mar. 2023)	Appendix I Initiated	# Events to Complete Baseline Appendix I or Completion Date [113.10(5)b]	Appendix II Initiated	# Events to Complete Baseline Appendix II or Completion Date [113.10(6)b]	Returned to Detection Monitoring (Yes/No)
Downgradient Monitoring Locations							
MW-12	Corrective Action	Appendix II	N/A	N/A	Aug-08	Sep-09	No
MW-13	Corrective Action	Appendix II	N/A	N/A	Aug-08	Sep-09	No
MW-16	Corrective Action	Appendix II	N/A	N/A	Aug-08	Sep-09	No
MW-17	Corrective Action	Appendix II	N/A	N/A	Aug-08	Sep-09	No
MW-26	Assessment [3]	Full Appendix II [3]	N/A	N/A	Aug-08	Sep-09	Aug-22
					Jan-23	Mar-23	No
MW-32	Corrective Action	Appendix II	N/A	N/A	Aug-08	Sep-09	No
Background Monitoring Locations							
MW-37	Background	Appendix II	N/A	N/A	Aug-08	Sep-09	---
MW-101A	Background	Appendix II	Sep-13 [4]	Sep-14 [4]	Sep-13 [4]	Sep-14 [4]	---

N/A = Not applicable. Monitoring points were under routine parameter sampling per IAC 113.2(5) prior to the initiation of Appendix II.

[1] In accordance with Permit Amendment #16, annual monitoring at AW-1, AW-2, AW-3, AW-4, AW-5, MW-20, MW-21, MW-23, MW-24, MW-28, MW-30, MW-34, MW-35, VP-3, VP-4, MW-105A, MW-106A, MW-107A, and MW-109A is scheduled for Fall 2023. Therefore, these locations were not monitored in Mar. 2023.

[2] Unless otherwise noted, Appendix II locations were sampled for the Appendix I and detected Appendix II constituents in Mar. 2023. Resampling for the full Appendix II list at the assessment, corrective action, and background monitoring wells is conducted every five years.

[3] In accordance with 567 IAC 113.10(6)a, two rounds of quarterly re-triggered baseline assessment monitoring for the full Appendix II list were conducted at MW-26 in Jan. and Mar. 2023.

[4] Six rounds of background monitoring for the Appendix II metals were conducted at MW-101A between Sep. 2013 and Mar. 2015. Background monitoring for the full Appendix II list was conducted in Sep. 2015, Mar. 2016, and Aug. 2020.

Table 2
Deeper Bedrock Monitoring Locations and Schedule [1]
Aug. 2008 – Mar. 2023 Appendix I & II Data

Monitoring Location	Monitoring Program	Current Schedule [2] (Mar. 2023)	Appendix I Initiated	# Events to Complete Baseline Appendix I or Completion Date [113.10(5)b]	Appendix II Initiated	# Events to Complete Baseline Appendix II or Completion Date [113.10(6)b]	Returned to Detection Monitoring (Yes/No)
Downgradient Monitoring Locations							
MW-14	Corrective Action	Appendix II	N/A	N/A	Aug-08	Sep-09	No
MW-33	Corrective Action	Appendix II	N/A	N/A	Aug-08	Sep-09	No
Background Monitoring Locations							
MW-38	Background	Appendix II	N/A	N/A	Aug-08	Sep-09	---
MW-101B	Background	Appendix II	Sep-13 [3]	Sep-14 [3]	Sep-13 [3]	Sep-14 [3]	---
Delineation Monitoring Locations							
MW-109B	Delineation	Appendix I	Nov-17	Nov-18	---	---	---

N/A = Not applicable. Monitoring points were under routine parameter sampling per IAC 113.2(5) prior to initiation of Appendix II.

[1] In accordance with Permit Amendment #16, annual monitoring at AW-6, CRL-9, MW-11, MW-15, MW-18, MW-19, MW-22, MW-25, MW-31, MW-36, MW-102B, MW-104B, MW-105B, MW-107B, and MW-108B is scheduled for Fall 2023. Therefore, these locations were not monitored in Mar. 2023.

[2] Appendix II locations were sampled for the Appendix I and detected Appendix II constituents in Mar. 2023. Resampling for the full Appendix II list at corrective action and background monitoring wells is conducted every five years.

[3] Six rounds of background monitoring for the Appendix II metals were conducted at MW-101B between Sep. 2013 and Mar. 2015. Two rounds of background monitoring for the full Appendix II list were conducted in Sep. 2015 and Mar. 2016.

In January and March 2023, two rounds of quarterly re-triggered baseline assessment monitoring for the full Appendix II list were conducted at MW-26 in accordance with 567 Iowa

Administrative Code (IAC) 113.10(6)b. Results from these two events will be utilized to determine whether additional rounds of quarterly monitoring are necessary or if MW-26 can return to annual monitoring.

In March 2023, semiannual corrective action, background, and delineation monitoring were also conducted at the locations listed in Tables 1 and 2. Corrective action monitoring and background locations were sampled for the Appendix I and detected Appendix II constituents in March 2023. In accordance with Permit Amendment #6, resampling for the full Appendix II list at corrective action and background monitoring wells is conducted every five years.

As footnoted in Tables 1 and 2, annual monitoring at upper bedrock wells AW-1, AW-2, AW-3, AW-4, AW-5, MW-20, MW-21, MW-23, MW-24, MW-28, MW-30, MW-34, MW-35, VP-3, VP-4, MW-105A, MW-106A, MW-107A, and MW-109A and deeper bedrock wells AW-6, CRL-9, MW-11, MW-15, MW-18, MW-19, MW-22, MW-25, MW-31, MW-36, MW-102B, MW-104B, MW-105B, MW-107B, and MW-108B is scheduled for Fall 2023. Therefore, these locations were not monitored in March 2023.

Under the detection and assessment monitoring programs of 567 IAC 113.10(5) and 113.10(6), Appendix I and II monitoring results are statistically compared to background levels as given in IAC 113.10(6)e and to the groundwater protection standard (GWPS) as given in 567 IAC 113.10(6)g and h. A well may return to detection monitoring when all Appendix II constituents are "shown to be at or below background values, using the statistical procedures in paragraph 113.10(4)g for two consecutive sampling events." Consequently, to return to detection monitoring in accordance with 567 IAC 113.10(6)e, all Appendix II constituents must be below the interwell prediction limit (for constituents which are detected in the background data set) or below the laboratory reporting limit (for constituents which are not detected in the background data set) during two consecutive sampling events. As mentioned in previous memos, three consecutive sampling events may be utilized to make the determination to return to detection monitoring to limit frequent fluctuation of wells moving between the detection and assessment monitoring programs. Assessment monitoring continues when Appendix II concentrations are above background values but below the GWPS using the statistical procedures in paragraph 113.10(4)g.

If Appendix II constituents are detected at statistically significant levels (SSLs) above the GWPS, characterization [567 IAC 113.10(6)g] is initiated, and the owners or operators are required to begin an assessment of corrective measures, select a remedy, and implement a remedy in accordance with 567 IAC 113.10(7), (8), and (9). For remedy completion [567 IAC 113.10(9)e(2)], compliance with the GWPS is considered achieved by demonstrating that concentrations of Appendix II constituents have not exceeded the GWPS for a period of three consecutive years or an alternate length of time established by the Iowa Department of Natural Resources (IDNR).

Based on the August 2008 through March 2023 results, this memo presents an evaluation of statistically significant increases (SSIs) and SSLs under the requirements of 567 IAC 113.10(4)g and h.

3 Statistical Methodology

The statistical methods utilized for locations in delineation, assessment, and corrective action monitoring were consistent with the methods used in previous statistical evaluations. Detailed

descriptions of the statistical methods are provided in Attachment 1. Sanitas® v9.6 (Sanitas Technologies) software was utilized to complete the statistical comparisons.

The combined background data sets (MW-37 and MW-101A for the upper bedrock, and MW-38 and MW-101B for the deeper bedrock) were utilized to evaluate SSIs over background.

3.1 Background Data Set Adjustments

3.1.1 Adjustments Associated with Turbidity and Total Suspended Solids

No background data set adjustments are recommended for MW-37, MW-38, and MW-101B based on review of the field turbidity and total suspended solids (TSS) data from the March 2023 sampling event. The March 2023 TSS concentrations at MW-37, MW-38, and MW-101B were below the 5 mg/L limit for acceptable sample quality. At background well MW-101A, the March 2023 TSS concentration of 12.6 mg/L slightly exceeded the 5 mg/L limit for acceptable sample quality. Barium, cadmium, cobalt, copper, nickel, selenium, and vanadium were detected above the minimum detection limit (MDL) at MW-101A in March 2023. Removal of these detected results at MW-101A is recommended since the March 2023 concentrations were above the range of historic concentrations and/or some TSS correlation was evident. The March 2023 barium, cadmium, cobalt, copper, nickel, selenium, and vanadium concentrations at MW-101A will be crossed-out in Table 14 of the 2023 AWQR.

The background data set adjustments previously recommended and incorporated based on the review of turbidity data include:

- Removal of the high-volume September 2013 through September 2014 metals data at MW-101A (initiated with Fall 2016 statistical evaluation).
- Removal of the high-volume September 2012 through September 2014 and the initial low-flow March 2015 metals data at MW-101B (initiated with Fall 2016 statistical evaluation).
- Removal of the March 2019 barium concentration in MW-38 due to elevated TSS and the potential for turbidity to contribute to the higher barium concentration identified (initiated with Spring 2019 statistical evaluation).

These data set adjustments were maintained in the current statistical evaluation. The removed background data will be listed as crossed-out concentrations in Table 14 of the 2023 AWQR.

Note that the historical high-volume data at the downgradient wells continue to be reviewed on a case-by-case basis. The downgradient data set review is discussed in Section 5.1.

3.1.2 Adjustments Associated with Practical Quantitation Limits

Due to the lowering of the practical quantitation limits (PQLs), background data set adjustments were approved to remove earlier non-detect data with elevated PQLs for barium, cobalt, copper, and lead in the upper bedrock and for barium, beryllium, cadmium, cobalt, copper, lead, and nickel in the deeper bedrock due to the increased uncertainty the elevated PQLs added. IDNR approved the background dataset adjustments due to elevated PQLs in the letters dated May 12, 2016 and November 20, 2017 (IDNR, 2016 and 2017). These data set adjustments were maintained in the current statistical evaluation.

3.1.3 Review of Single Background Detections

During the September 2015 event, m/p-cresol and phenol were detected above the laboratory reporting limit at upper bedrock background well MW-37. These two constituents have not been detected in either background well prior to or after the September 2015 event. As a result, m/p-cresol and phenol will not be evaluated using prediction limits unless additional background detections are identified. Downgradient m/p-cresol and phenol results will be evaluated using the double quantification rule (DQR).

Single volatile organic compound (VOC) detections were identified for carbon disulfide and toluene in MW-37 in August 2017. In November 2017, retest samples were collected, which did not confirm the November 2017 detections. As a result, it was determined that MW-37 remained suitable as a background well. The only other detections in MW-37 during the August 2017 event were for barium and cobalt. The August 2017 barium and cobalt concentrations were within the range of historical concentrations for these constituents at MW-37. Therefore, the barium and cobalt results were maintained in the background data set for calculating interwell prediction limits. Since VOCs are considered "never detected" constituents, carbon disulfide and toluene were not added as prediction limit constituents. Downgradient carbon disulfide and toluene results continue to be evaluated using the DQR.

Similarly, single VOC detections were identified for benzene, ethylbenzene, toluene, and total xylenes (BTEX) in MW-37 during the Fall 2018 sampling event. The August 2018 detected metals data at MW-37 was removed from the background dataset due to the potential impact indicated by the BTEX detections. A retest sample was collected for BTEX in background well MW-37 in November 2018. The retest results did not confirm the August 2018 BTEX detections; therefore, SSIs were not declared. In addition, the retest results indicated that MW-37 remained suitable for continued use as a background well for the upper bedrock system. Since VOCs are considered "never detected" constituents, the BTEX constituents were not added as prediction limit constituents. Downgradient BTEX results continue to be evaluated using the DQR.

3.2 Corrective Action Constituents

In accordance with the Unified Guidance (USEPA, 2009), corrective action statistics are conducted for analyte/well pairs with previously identified SSLs, as listed in Table 3. No new corrective action constituents were added based on the results of the previous Fall 2022 statistical evaluation.

Under corrective action statistics, comparisons to background are not conducted (except for cobalt in the upper bedrock under the corrective action hypothesis, further discussed in Section 5.2); therefore, the analyte/well pairs listed in Table 3 were not included in the Section 4 comparisons to background.

Table 3
Corrective Action Constituents (1)

Monitoring Location	Corrective Action Constituents (2)

MW-109B	Arsenic; Cobalt; Thallium

[1] Table 3 lists the analyte/well pairs identified as corrective action constituents regardless of whether the monitoring location was sampled during the current event.
[2] Corrective action constituents are analyte/well pairs with SSLs over the GWPS identified during previous statistical evaluations and have not achieved compliance with the GWPS in accordance with IAC 113.10(9)e(2).

4 Comparison to Background Levels

Comparisons to background levels were conducted using interwell prediction limits and the DQR. As noted in Section 3.2, comparisons to background were not conducted for the corrective action constituents listed in Table 3.

4.1 Interwell Prediction Limits

Interwell prediction limits were used for formal statistical assessment of SSIs over background for analytes that have been detected above the reporting limit in the combined background data set (MW-37 and MW-101A for the upper bedrock system; MW-38 and MW-101B for the deeper bedrock system). For the upper bedrock, these analytes included antimony, arsenic, barium, cobalt, copper, lead, nickel, tin, and zinc. For the deeper bedrock, these analytes included antimony, arsenic, barium, bis(2-ethylhexyl)phthalate, cadmium, cobalt, copper, nickel, tin, and zinc. Note that interwell prediction limit comparisons were not conducted for arsenic in deeper bedrock during this statistical evaluation since arsenic is a corrective action constituent in the deeper bedrock locations that were sampled during the March 2023 event. The March 2023 downgradient arsenic concentrations in deeper bedrock will be evaluated using corrective action statistics.

4.1.1 Upper Bedrock

The upper bedrock prediction limits calculated utilizing August 2008 through March 2023 sample data are summarized in Table 4. The background data set adjustments discussed in Section 3.1 were utilized.

Table 4
Prediction Limit Summary - Upper Bedrock
Aug. 2008 – Mar. 2023 Interwell Data [1]

Chemical Name	Prediction Limit	Units	Prediction Limit Type	Retesting Plan	Prediction Limit Method
Antimony	0.00739	mg/L	Non-Parametric	1-of-2	Maximum Order Statistic
Arsenic	0.00205	mg/L	Non-Parametric	1-of-2	Maximum Order Statistic
Barium	0.115	mg/L	Parametric (Lognormal)	1-of-2	$\exp(\bar{y} + k \cdot s_y)$
Cobalt	0.008	mg/L	Non-Parametric	1-of-2	Maximum Order Statistic
Copper	0.0225	mg/L	Non-Parametric	1-of-2	Maximum Order Statistic
Lead	0.00695	mg/L	Non-Parametric	1-of-2	Maximum Order Statistic
Nickel	0.0522	mg/L	Non-Parametric	1-of-2	Maximum Order Statistic
Tin [2]	0.152	mg/L	Non-Parametric	1-of-2	Maximum Order Statistic
Zinc	0.0805	mg/L	Non-Parametric	1-of-2	Maximum Order Statistic

[1] Interwell data consists of the Appendix I and II parameters that have been detected in the combined background data set (MW-37 and MW-101A). Note that background data set adjustments were incorporated in accordance with Section 3.1.
[2] Tin was included only for assessment and corrective action monitoring locations.

Non-parametric prediction limits were used for antimony, arsenic, cobalt, copper, lead, nickel, tin, and zinc since either normality assumptions could not be met or there were less than 50% detects in the combined background data. A parametric lognormal prediction limit was used with barium since there were greater than 50% detects in the combined background data set, the assumptions of normality were met with a lognormal transformation, and the lognormal limit was accepted as being representative of the background distribution.

4.1.2 Deeper Bedrock

Deeper bedrock prediction limits calculated from August 2008 through March 2023 sample data are summarized in Table 5. The background data set adjustments discussed in Section 3.1 were utilized.

Table 5
Prediction Limit Summary - Deeper Bedrock
Aug. 2008 – Mar. 2023 Interwell Data [1]

Chemical Name	Prediction Limit	Units	Prediction Limit Type	Retesting Plan	Prediction Limit Method
Antimony	0.0101	mg/L	Non-Parametric	1-of-2	Maximum Order Statistic
Arsenic [2]	0.00225	mg/L	Non-Parametric	1-of-2	Maximum Order Statistic
Barium	0.138	mg/L	Non-Parametric	1-of-2	Maximum Order Statistic
Bis(2-ethylhexyl) phthalate [3]	25.4	ug/L	Non-Parametric	1-of-2	Maximum Order Statistic
Cadmium	0.000824	mg/L	Non-Parametric	1-of-2	Maximum Order Statistic
Cobalt	0.0009063	mg/L	Parametric (Lognormal)	1-of-2	$\exp(\bar{y} + k \cdot s_y)$
Copper	0.0108	mg/L	Non-Parametric	1-of-2	Maximum Order Statistic
Nickel	0.00735	mg/L	Non-Parametric	1-of-2	Maximum Order Statistic
Tin [3]	0.109	mg/L	Non-Parametric	1-of-2	Maximum Order Statistic
Zinc	0.0366	mg/L	Non-Parametric	1-of-2	Maximum Order Statistic

[1] Interwell data consists of the Appendix I and II parameters that have been detected in the combined background data set (MW-38 and MW-101B). Note that background data set adjustments were incorporated in accordance with Section 3.1.
[2] Note that interwell prediction limit comparisons were not conducted for arsenic in deeper bedrock during this statistical evaluation since arsenic is a corrective action constituent in the deeper bedrock locations that were sampled during the March 2023 event. The March 2023 downgradient arsenic concentrations in deeper bedrock will be evaluated using corrective action statistics.
[3] Bis(2-ethylhexyl)phthalate and tin were included only for assessment and corrective action monitoring locations.

Non-parametric prediction limits were used for antimony, barium, bis(2-ethylhexyl)phthalate, cadmium, copper, nickel, tin, and zinc since either normality assumptions could not be met or there were less than 50% detects in the combined background data. A parametric lognormal prediction limit was used with cobalt since there were greater than 50% detects in the combined background data set, the assumptions of normality were met with a lognormal transformation, and the lognormal limit was accepted as being representative of the background distribution.

4.1.3 Prediction Limit Exceedances

A summary of the monitoring locations exhibiting a prediction limit exceedance during the January and March 2023 events is given in Table 6 for the upper bedrock system and Table 7 for the deeper bedrock system. Detailed prediction limit output for each analyte/well pair is included in Attachment 2.

Table 6
Jan. & Mar. 2023 Prediction Limit Exceedances – Upper Bedrock

Prediction Limit	Sample Date	Barium (mg/L) 0.115	Nickel (mg/L) 0.0522
Assessment Monitoring Locations			
MW-26	Jan. 2023	0.139	
MW-26	Mar. 2023	0.131	
Corrective Action Monitoring Locations – Assessment Constituents			
MW-12	Mar. 2023	0.407	0.0828
MW-13	Mar. 2023	1.1	
MW-16	Mar. 2023	0.172	
MW-17	Mar. 2023	0.161	
MW-32	Mar. 2023	0.695	

Table 7
Mar. 2023 Prediction Limit Exceedances - Deeper Bedrock

Prediction Limit	Barium (mg/L) 0.138	Cobalt (mg/L) 0.0009063	Nickel (mg/L) 0.00735
Delineation Monitoring Locations – Assessment Constituents			
MW-109B	0.633		0.0366
Corrective Action Monitoring Locations – Assessment Constituents			
MW-14	0.283		0.0156
MW-33	0.449	0.00104	

4.2 Double Quantification Rule

The DQR was used to evaluate SSIs over background for the remaining Appendix I and II constituents (i.e., constituents which have not been detected above the reporting limit in the combined background data set). The DQR output is included in Attachment 3, with a summary of the January and March 2023 DQR detections listed in Table 8 for the upper bedrock wells and Table 9 for the deeper bedrock wells.

Table 8
Upper Bedrock Double Quantification Rule
Jan. & Mar. 2023 Detections

Well	Sample Date	Constituent(s)
Assessment Monitoring Locations		
MW-26	Mar. 2023	Acetone
Corrective Action Monitoring Locations - Assessment Constituents (Continued)		
MW-12	Mar. 2023	1,1-Dichloroethane; 1,2-Dichlorobenzene; 1,4-Dichlorobenzene; Benzene; Chlorobenzene; cis-1,2-Dichloroethene; Thallium
MW-13	Mar. 2023	1,1-Dichloroethane; 1,2-Dichlorobenzene; 1,4-Dichlorobenzene; Benzene; Chlorobenzene
MW-16	Mar. 2023	1,2-Dichlorobenzene; 1,4-Dichlorobenzene; Benzene; Cadmium; Chlorobenzene; Silver; Thallium
MW-32	Mar. 2023	1,4-Dichlorobenzene; Chlorobenzene

Table 9
Deeper Bedrock Double Quantification Rule

Well	Constituent(s)
Delineation Monitoring Locations - Assessment Constituents	
MW-109B	1,4-Dichlorobenzene; Chlorobenzene
Corrective Action Monitoring Locations (Assessment Constituents)	
MW-14	1,1-Dichloroethane; 1,4-Dichlorobenzene; Benzene; Chlorobenzene; cis-1,2-Dichloroethene; Silver
MW-33	Chlorobenzene

4.3 Summary of Comparison to Background

4.3.1 Delineation Monitoring Locations – Assessment Constituents

Prediction limit exceedances and DQR detections were identified at MW-109B as listed in Tables 7 and 9, respectively. In lieu of retesting for the prediction limit exceedances and DQR detections, SSIs were declared and evaluated for SSLs in Section 5.

4.3.2 Assessment Monitoring Locations

Prediction limit exceedances and DQR detections were identified at MW-26 in January and March 2023 as listed in Tables 6 and 8, respectively. In lieu of retesting for the prediction limit exceedances and DQR detections, SSIs were declared and evaluated for SSLs in Section 5.

4.3.3 Corrective Action Monitoring Locations – Assessment Constituents

For the upper bedrock system, prediction limit exceedances and DQR detections were identified at MW-12, MW-13, MW-16, MW-17, and MW-32 as listed in Tables 6 and 8, respectively. In lieu of retesting for the prediction limit exceedances and DQR detections, SSIs were declared and evaluated for SSLs in Section 5.

For the deeper bedrock system, prediction limit exceedances and DQR detections were identified at MW-14 and MW-33 as listed in Tables 7 and 9, respectively. In lieu of retesting for the prediction limit exceedances and DQR detections, SSIs were declared and evaluated for SSLs in Section 5.

5 Comparison to Groundwater Protection Standard

The prediction limit exceedances and DQR detections listed in Tables 6 through 9 were declared SSIs and evaluated for SSLs over the GWPS per IAC 113.10(6)f and g. Comparisons to the GWPS were evaluated through statistical confidence intervals under the assessment monitoring null hypothesis. SSLs were declared to exist with statistical certainty when the lower confidence limit exceeds the GWPS. Statistical outputs for confidence intervals in assessment mode are included in Attachment 4.

In contrast, corrective action analyte/well pairs (i.e., those where SSLs have been previously declared) were evaluated to determine compliance with the GWPS per IAC 113.10(9)e. A summary of the upper and deeper bedrock corrective action constituents was provided in Table 3. Comparisons to the GWPS in this case were evaluated through statistical confidence intervals under the corrective action monitoring null hypothesis, or in the case of downward trending data, confidence bands (upper 95% confidence limits) placed around the linear trend line. For corrective action constituents, compliance with the GWPS has been achieved with statistical certainty when the UCL or the upper 95% confidence limit on the trend line is lower than the GWPS for three consecutive years or an alternate length of time established by the IDNR. Statistical outputs for regression statistics, confidence bands, and confidence intervals in corrective action mode are included in Attachment 5.

5.1 Compliance Data Set Review for Confidence Intervals

5.1.1 Adjustments Due to Changes in PQLs

Downgradient data set adjustments were approved to remove earlier non-detect data with elevated PQLs for upper bedrock cobalt data at AW-5, MW-13, MW-17, MW-23, and MW-35; to remove earlier non-detect and J-flagged data with elevated PQLs for deeper bedrock cobalt data at AW-6, CRL-9, MW-11, MW-14, MW-15, MW-22, MW-33 MW-36, MW-102B, MW-105B, and MW-107B; and to remove earlier non-detect and J-flagged data with elevated PQLs for the deeper bedrock nickel data at AW-6, CRL-9, MW-14, MW-15, MW-18, MW-19, MW-22, MW-33, and MW-36 due to the increased uncertainty the elevated PQLs added. IDNR approved the downgradient cobalt dataset adjustments due to elevated PQLs in the letters dated May 12, 2016 and November 20, 2017 (IDNR, 2016 and 2017). These data set adjustments were maintained in the current statistical evaluation.

5.1.2 Adjustments Due to Sampling Technique Changes

As noted in Section 3.1, the downgradient metals data sets continued to be reviewed on a case-by-case basis to determine whether data set adjustments are recommended based on the change in sampling technique from high-volume to low-flow sampling methods. In the letter dated November 20, 2017 (IDNR, 2017), IDNR concurred with the strategy to analyze wells on a case-by-case basis for a statistical correlation between newer and older sampling techniques.

No data set adjustments are currently recommended for the SSIs listed in Tables 6 through 9 and the corrective action constituents in Table 3. To date, downgradient data set adjustments include removal of the high-volume August 2008 through September 2014 zinc data at AW-7, MW-20, and MW-30 and removal of the high-volume August 2008 through September 2014 nickel data at MW-13. IDNR approved the zinc and nickel data set adjustments in the letter dated November 20, 2017 (IDNR, 2017). These data set adjustments were maintained in the current statistical evaluation.

5.1.3 Adjustments Due to Exiting Corrective Action

As further detailed in Attachment 1, the historical data prior to when statistical compliance with the GWPS was first achieved will be removed when analyte/well pairs exit corrective action and return to assessment constituents. Nickel in MW-12; cobalt, nickel, and vinyl chloride in MW-13; cobalt in MW-23; and arsenic in VP-3 exited corrective action and returned to assessment constituents during the Fall 2019 or Spring 2020 statistical evaluations. Cobalt in AW-5 and MW-17 exited corrected action and returned to assessment constituents during the Fall 2020 statistical evaluation. Compliance with the GWPS was first achieved in Spring 2015 for nickel in MW-12 and vinyl chloride in MW-13; in Fall 2016 for cobalt and nickel in MW-13 and cobalt in MW-23; in Spring 2017 for arsenic in VP-3; and in Fall 2017 for cobalt in AW-5 and MW-17. The historical data prior to these initial compliance dates have been removed.

The following data set adjustments due to exiting corrective action were maintained for Site 1:

- Removal of the Aug. 2008 through Sep. 2014 nickel data in MW-12.
- Removal of the Sep. 2009 through Mar. 2016 cobalt data in MW-13.
- Removal of the Mar. 2015 through Mar. 2016 nickel data in MW-13. Note that nickel data prior to Mar. 2015 had already been removed as discussed in Section 5.1.2.
- Removal of the Aug. 2008 through Sep. 2014 vinyl chloride data in MW-13.
- Removal of the Sep. 2010 through Mar. 2016 cobalt data in MW-23. Note that earlier non-detect cobalt data had already been removed as discussed in Section 5.1.1.
- Removal of the Aug. 2008 through Aug. 2016 arsenic data in VP-3.
- Removal of the Sep. 2010 through March 2017 cobalt data in AW-5. Note that earlier non-detect cobalt data had already been removed as discussed in Section 5.1.1.
- Removal of the Sep. 2009 through March 2017 cobalt data in MW-17. Note that earlier non-detect cobalt data had already been removed as discussed in Section 5.1.1.

5.2 Background as the Cobalt GWPS

Background cobalt concentrations in the upper bedrock data set exceeded the 567 IAC Chapter 137 Statewide Standard. Therefore, pursuant to 567 IAC 113.10(6)h, the GWPS for cobalt becomes background. The GWPS for cobalt in corrective action monitoring was evaluated with the statistical methods described in Attachment 1 and as recommended in the Unified Guidance (USEPA, 2009). Both the prediction limit (i.e., *two-sample*) and confidence interval (i.e., *one-sample*) methods were evaluated. Where concentration shifts were detected in the data, the *one-sample* confidence interval method was evaluated utilizing the linear trend line approach further detailed in Section 5.3 below. With background as the GWPS, the upper confidence limit is compared to the background upper tolerance limit with 95% confidence and 95% coverage (discussed in detail in Attachment 1).

Note that in March 2023, no SSIs were identified for cobalt in the upper bedrock monitoring locations, and none of the upper bedrock corrective action monitoring locations sampled had cobalt as a corrective action constituent. Therefore, comparisons to the GWPS were not conducted for cobalt in the upper bedrock during this statistical evaluation.

5.3 Data Concentration Shifts During Corrective Action

Statistically significant decreasing linear trends continued to be identified for arsenic in MW-12 (since 2008) and cobalt in MW-109B (since 2017). Consistent with previous memos, 90% confidence bands (upper 95% confidence limits) placed around the linear trend line were used since significantly decreasing linear trends were identified for these well/analyte pairs.

Regression statistics and confidence band outputs for these analyte/well pairs are provided in Attachment 5. The upper 95% confidence limits were above the GWPS for arsenic in MW-12 and cobalt in MW-109B.

5.4 SSL Summary

Confidence interval output for the upper and deeper bedrock assessment constituents is included in Attachment 4, and for the upper and deeper bedrock corrective action constituents is included in Attachment 5. The results for the upper bedrock are summarized in Table 10, and the results for the deeper bedrock are summarized in Table 11.

Table 10
Upper Bedrock SSL Summary
Aug. 2008 – Mar. 2023 Appendix II Data

Chemical Name	Wells with SSL [1]	SSL Not Identified or Rejected [1]	GWPS [2]
Assessment Monitoring Locations			
Acetone (ug/L)		MW-26	6300
Barium (mg/L)		MW-26	2
Corrective Action Monitoring Locations – Assessment Constituents			
1,1-Dichloroethane (ug/L)		MW-12, MW-13	140
1,2-Dichlorobenzene (ug/L)		MW-12, MW-13, MW-16	600
1,4-Dichlorobenzene (ug/L)		MW-12, MW-13, MW-16, MW-32	75
Barium (mg/L)		MW-12, MW-13, MW-16, MW-17, MW-32	2
Benzene (ug/L)		MW-12, MW-13, MW-16	5
Cadmium (mg/L)		MW-16	0.005
Chlorobenzene (ug/L)		MW-12, MW-13, MW-16, MW-32	100
cis-1,2-Dichloroethene (ug/L)		MW-12	70
Nickel (mg/L)		MW-12	0.1
Silver (mg/L)		MW-16	0.1
Thallium (mg/L)		MW-12, MW-16	0.002
Corrective Action Monitoring Locations – Corrective Action Constituents			
Arsenic (mg/L)	MW-12, MW-13, MW-16, MW-17, MW-32		0.01

[1] Under the assessment null hypothesis, an SSL is indicated when the lower confidence limit exceeds the GWPS. Under the corrective action null hypothesis, an SSL remains when the upper confidence limit exceeds the GWPS.
[2] Values are the 40 CFR Part 141 Safe Drinking Water Act MCL or the IAC 567 Chapter 137 Statewide Standard for a Protected Groundwater Source.

1,1-Dichloroethane (ug/L)		MW-14	140
1,4-Dichlorobenzene (ug/L)		MW-14	75

Table 11 Continued
Deeper Bedrock SSL Summary
Aug. 2008 – Mar. 2023 Appendix II Data

Chemical Name	Wells with SSL [1]	SSL Not Identified or Rejected [1]	GWPS [2]
Corrective Action Monitoring Locations – Assessment Constituents Continued			
Barium (mg/L)		MW-14, MW-33	2
Benzene (ug/L)		MW-14	5
Chlorobenzene (ug/L)		MW-14, MW-33	100
cis-1,2-Dichloroethene (ug/L)		MW-14	70
Cobalt (mg/L)		MW-33	0.0021
Nickel (mg/L)		MW-14	0.1
Silver (mg/L)		MW-14	0.1
Corrective & Delineation Action Monitoring Locations – Corrective Action Constituents			
Arsenic (mg/L)	MW-14, MW-33, MW-109B		0.01
Cobalt (mg/L)	MW-109B		0.0021
Thallium (mg/L)	MW-109B		0.002

[1] Under the assessment null hypothesis, an SSL is indicated when the lower confidence limit exceeds the GWPS. Under the corrective action null hypothesis, an SSL remains when the upper confidence limit exceeds the GWPS.
[2] Values are the 40 CFR Part 141 Safe Drinking Water Act MCL or the IAC 567 Chapter 137 Statewide Standard for a Protected Groundwater Source.

5.5 Summary of Comparison to Groundwater Protection Standard

5.5.1 Delineation Monitoring Locations

No SSLs were identified for the assessment constituents in deeper bedrock delineation monitoring location MW-109B. Arsenic, cobalt, and thallium in MW-109B were evaluated as corrective action constituents. SSLs continued to be identified for these analyte/well pairs; therefore, compliance with the GWPS has not been achieved. Note that a statistically significant decreasing trend was identified for cobalt in MW-109B.

5.5.2 Assessment Monitoring Locations

No SSLs were identified in upper bedrock assessment monitoring location MW-26.

5.5.3 Corrective Action Monitoring Locations

No SSLs were identified for the assessment constituents in the upper and deeper bedrock corrective action monitoring locations.

For the upper bedrock corrective action constituents, SSLs over the GWPS remained for arsenic in MW-12, MW-13, MW-16, MW-17, and MW-32. While compliance with the GWPS was not achieved, a statistically significant decreasing trend was identified for arsenic in MW-12.

For the deeper bedrock corrective action constituents, SSLs over the GWPS remained for arsenic in MW-14 and MW-33.

6 Conclusions

The methodology described in Attachment 1 was utilized to conduct the statistical evaluations for the upper and deeper bedrock locations in the assessment, delineation, and corrective action monitoring programs.

In January and March 2023, two rounds of quarterly re-triggered baseline assessment monitoring for the full Appendix II list were conducted at MW-26 in accordance with 567 IAC 113.10(6)a.

In March 2023, semiannual corrective action, background, and delineation monitoring were also conducted at upper bedrock monitoring locations MW-12, MW-13, MW-16, MW-17, MW-32, MW-37, and MW-101A and deeper bedrock monitoring locations MW-14, MW-33, MW-38, MW-101B, and MW-109B. In accordance with Permit Amendment #16, annual monitoring at upper bedrock monitoring locations AW-1, AW-2, AW-3, AW-4, AW-5, MW-20, MW-21, MW-23, MW-24, MW-28, MW-30, MW-34, MW-35, VP-3, VP-4, MW-105A, MW-106A, MW-107A, and MW-109A and deeper bedrock monitoring locations AW-6, CRL-9, MW-11, MW-15, MW-18, MW-19, MW-22, MW-25, MW-31, MW-36, MW-102B, MW-104B, MW-105B, MW-107B, and MW-108B is scheduled for Fall 2023. Therefore, these locations were not monitored in March 2023.

6.1 Upper Bedrock Monitoring Locations

A summary of the Spring 2023 statistical evaluation results for the upper bedrock system is presented in Table 12.

Table 12
Summary of the Spring 2023 Evaluation - Upper Bedrock

Monitoring Location	Monitoring Program	Current Schedule [1,2] (Mar. 2023)	Current SSIs	Corrective Action Constituents		Retesting Parameter	Monitoring Program Changes
				Current SSLs [3]	Achieved Compliance with GWPS		
Downgradient Monitoring Locations							
MW-12	Corrective Action	Appendix II	1,1-Dichloroethane; 1,2-Dichlorobenzene; 1,4-Dichlorobenzene; Barium; Benzene; Chlorobenzene; cis-1,2-Dichloroethene; Nickel; Thallium	Arsenic			
MW-13	Corrective Action	Appendix II	1,1-Dichloroethane; 1,2-Dichlorobenzene; 1,4-Dichlorobenzene; Barium; Benzene; Chlorobenzene	Arsenic			
MW-16	Corrective Action	Appendix II	1,2-Dichlorobenzene; 1,4-Dichlorobenzene; Barium; Benzene; Cadmium; Chlorobenzene; Silver; Thallium	Arsenic			
MW-17	Corrective Action	Appendix II	Barium	Arsenic			
MW-26	Assessment [4]	Full Appendix II	Acetone; Barium				
MW-32	Corrective Action	Appendix II	1,4-Dichlorobenzene; Barium; Chlorobenzene	Arsenic			
Background Monitoring Locations							
MW-37	Background	Appendix II					
MW-101A	Background	Appendix II					

[1] In accordance with Permit Amendment #16, annual monitoring at AW-1, AW-2, AW-3, AW-4, AW-5, MW-20, MW-21, MW-23, MW-24, MW-26, MW-28, MW-30, MW-34, MW-35, VP-3, VP-4, MW-105A, MW-106A, MW-107A, and MW-109A is scheduled for Fall 2023. Therefore, these locations were not monitored in Mar. 2023.

[2] Unless otherwise noted, Appendix II locations were sampled for the Appendix I and detected Appendix II constituents in Mar. 2023. Resampling for the full Appendix II list at assessment, corrective action, and background monitoring locations is conducted every five years.

[3] Analyte/well pairs with SSLs over the GWPS identified during previous statistical evaluations and have not achieved compliance with the GWPS for 3 consecutive years in accordance with 567 IAC 113.10(9)e(2).

[4] In accordance with 567 IAC 113.10(6)a, two rounds of quarterly re-triggered baseline assessment monitoring for the full Appendix II list were conducted at MW-26 in Jan. and Mar. 2023. Note: barium was identified as an SSI for the Jan. and Mar. 2023 events.

6.1.1 Assessment Monitoring

In January and March 2023, two rounds of quarterly re-triggered baseline assessment monitoring for the full Appendix II list were conducted at MW-26 in accordance with 567 IAC 113.10(6)a. The SSIs identified at MW-26 are summarized in Table 12. No SSLs were identified.

Since no new Appendix II constituents were detected above the practical quantitation limit (PQL) during the two rounds of quarterly re-triggered baseline assessment monitoring at MW-26, no additional quarterly baseline assessment monitoring events are recommended. In addition, no new constituents will be added to the detected Appendix II constituents during the annual assessment monitoring events for the Appendix I and detected Appendix II constituents.

Annual assessment monitoring for Appendix I and detected Appendix II constituents will be conducted at AW-3, AW-4, AW-5, MW-21, MW-23, MW-26, MW-28, VP-3, and VP-4 in Fall 2023. In accordance with Permit Amendment #6, the next five-year resampling for the full Appendix II list will be conducted in Fall 2025 at AW-3, AW-4, AW-5, MW-21, MW-23, MW-26, MW-28, VP-3, and VP-4 and in Fall 2028 at MW-26.

6.1.2 Corrective Action Monitoring

In March 2023, semiannual corrective action monitoring was conducted at MW-12, MW-13, MW-16, MW-17, and MW-32 for the Appendix I and detected Appendix II constituents. The SSIs identified for the assessment constituents in the upper bedrock corrective action monitoring locations are summarized in Table 12. No SSLs were identified for the assessment constituents in the upper bedrock corrective action monitoring locations.

Confidence intervals in corrective action mode or 90% confidence bands around linear trend lines were utilized to evaluate arsenic in MW-12, MW-13, MW-16, MW-17, and MW-32 (i.e., the corrective action constituents in these locations). As shown in Table 12, SSLs remained for arsenic in MW-12, MW-13, MW-16, MW-17, and MW-32. Note that while compliance with the GWPS was not achieved, a statistically significant decreasing trend was identified for arsenic in MW-12.

Semiannual corrective action monitoring for the Appendix I and detected Appendix II constituents will be conducted at MW-12, MW-13, MW-16, MW-17, and MW-32 in Fall 2023 and Spring 2024. Annual corrective action monitoring for the Appendix I and detected Appendix II constituents will be conducted at AW-1, AW-2, MW-20, MW-24, MW-30, MW-34, and MW-35 in Fall 2023. In accordance with Permit Amendment #6, the next five-year resampling for the full Appendix II list will be conducted at the corrective action monitoring locations in Fall 2025.

6.1.3 Background Monitoring

Semiannual background monitoring for the Appendix I and detected Appendix II constituents was conducted at MW-37 and MW-101A in March 2023. Semiannual background monitoring for the Appendix I and detected Appendix II constituents will be continued at MW-37 and MW-101A in Fall 2023 and Spring 2024.

6.2 Deeper Bedrock Monitoring Locations

A summary of the Spring 2023 statistical evaluation results for the deeper bedrock system is presented in Table 13.

Table 13
Summary of the Spring 2023 Evaluation - Deeper Bedrock

Monitoring Location	Monitoring Program	Current Schedule [1,2] (Mar. 2023)	Current SSIs	Corrective Action Constituents		Retesting Parameter	Monitoring Program Changes
				Current SSLs [3]	Achieved Compliance with GWPS		
Downgradient Monitoring Locations							
MW-14	Corrective Action	Appendix II	1,1-Dichloroethane; 1,4-Dichlorobenzene; Barium; Benzene; Chlorobenzene; cis-1,2-Dichloroethene; Nickel; Silver	Arsenic			
MW-33	Corrective Action	Appendix II	Barium; Chlorobenzene; Cobalt	Arsenic			
Background Monitoring Locations							
MW-38	Background	Appendix II					
MW-101B	Background	Appendix II					
Delineation Monitoring Locations							
MW-109B	Delineation	Appendix I	1,4-Dichlorobenzene; Barium; Chlorobenzene; Nickel	Arsenic; Cobalt; Thallium			

(1) In accordance with Permit Amendment #16, annual monitoring at AW-6, CRL-9, MW-11, MW-15, MW-18, MW-19, MW-22, MW-25, MW-31, MW-36, MW-102B, MW-104B, MW-105B, MW-107B, and MW-108B is scheduled for Fall 2023. Therefore, these locations were not monitored in Mar. 2023.

(2) Appendix II locations were sampled for the Appendix I and detected Appendix II constituents in Mar. 2023. Resampling for the full Appendix II list at corrective action and background monitoring locations is conducted every five years

(3) Analyte/well pairs with SSLs over the GWPS identified during previous statistical evaluations and have not achieved compliance with the GWPS for 3 consecutive years in accordance with 567 IAC 113.10(9)e(2).

6.2.1 Delineation Monitoring

In March 2023, semiannual delineation monitoring was conducted at MW-109B for the Appendix I list. The SSIs identified for the assessment constituents in MW-109B are summarized in Table 13. No SSLs were identified for the assessment constituents in deeper bedrock delineation monitoring location MW-109B.

Confidence intervals in corrective action mode or 90% confidence bands around linear trend lines were utilized to evaluate arsenic, cobalt, and thallium in MW-109B (i.e., the corrective action constituents in MW-109B). SSLs continued to be identified for these analyte/well pairs; therefore, compliance with the GWPS has not been achieved. While compliance with the GWPS was not achieved, a statistically significant decreasing trend was identified for cobalt in MW-109B.

Semiannual delineation monitoring for the Appendix I constituents will be conducted at MW-109B in Fall 2023 and Spring 2024. In Fall 2023, annual delineation monitoring will be conducted at MW-102B, MW-105B, and MW-107B for the Appendix I constituents, at MW-104B for arsenic, and at MW-108B for the Appendix I list without cobalt.

6.2.2 Corrective Action Monitoring

In March 2023, semiannual corrective action monitoring for the Appendix I and detected Appendix II constituents was conducted at MW-14 and MW-33. The SSIs identified for the assessment constituents in the deeper bedrock corrective action monitoring locations are summarized in Table 13. No SSLs were identified for the assessment constituents in the deeper bedrock corrective action monitoring locations.

Confidence intervals in corrective action mode were utilized to evaluate arsenic in MW-14 and MW-33 (i.e., the corrective action constituents in these locations). As shown in Table 13, SSLs remained for arsenic in MW-14 and MW-33.

Semiannual corrective action monitoring for the Appendix I and detected Appendix II constituents will be conducted at MW-14 and MW-33 in Fall 2023 and Spring 2024. Annual corrective action monitoring for the Appendix I and detected Appendix II constituents will be conducted at AW-6, CRL-9, MW-22, and MW-36 in Fall 2023. In accordance with Permit Amendment #6, the next five-year resampling for the full Appendix II list will be conducted at the corrective action monitoring locations in Fall 2025.

6.2.3 Background Monitoring

Semiannual background monitoring for the Appendix I and detected Appendix II constituents was conducted at MW-38 and MW-101B in March 2023. Semiannual background monitoring for the Appendix I and detected Appendix II constituents will be continued at MW-38 and MW-101B in Fall 2023 and Spring 2024.

Attachment 1
Detailed Discussion of Statistical Methods

Memorandum

Statistical Methodology

1. Comparison to Background

For determining which parameters will need a formal statistical treatment, the Unified Guidance (EPA, 2009) suggests splitting monitoring parameters into three distinct groups: a) reliable indicators selected for formal testing; b) other analytes which are monitored for general groundwater quality information but not statistically tested; and c) those meeting the "never-detected" criteria. Only those parameters with some historically detected presence in background need to be included in the first group and treated with a formal statistical test. Any parameter that has never been detected in background is eligible for the third group of "never-detected" constituents. Constituents with detections below the reporting limit (J-flagged data) will be considered "never-detected." As a means of evaluating the third group, the Unified Guidance suggests the Double Quantification Rule (DQR). The DQR is stated in the Unified Guidance as:

"A confirmed exceedance is registered if any well-constituent pair in the '100% non-detect' group exhibits quantified measurements [i.e., at or above the reporting limit (RL)] in two consecutive sample and resample events."

The Unified Guidance also recommends establishing background sample sizes as large as feasible. The guidance recognizes that small sample sizes in background can be "particularly" troublesome, especially in controlling statistical test false positive and negative rates. With parametric tests (such as parametric prediction limits), the false positive rate may be controlled, but at the expense of statistical power. With non-parametric tests (such as non-parametric prediction limits or the "quasi-statistical" DQR), the false positive rate may be unacceptably high. The Unified Guidance suggests that generally at least 8 to 10 separate background measurements be available, recognizing that statistical power continues to increase with larger sample sizes.

In reports prior to the *2011 Annual Water Quality Report* (Foth, 2012), the ANOVA and a "2x2 contingency table" methods were used to evaluate statistically significant increases (SSIs) over background. These methods met the criteria of Iowa Administrative Code (IAC) 113.10(4)g and h. The ANOVA and "2x2 contingency table" methods were used to maximize the statistical power while minimizing potentially large false positive rates as a result of the smaller sample sizes.

Starting with the *2011 Annual Water Quality Report* (Foth, 2012), the statistical analysis methods utilized for comparison to background were the DQR and "1-of-3" interwell prediction limits as recommended in the Unified Guidance (EPA, 2009). Note that a "1-of-2" retesting plan was not selected as it would have resulted in a 'low' effective statistical power level for the site based on EPA reference power curves as defined in the Unified Guidance.

Starting with the Spring 2021 statistical evaluation, the interwell prediction limit retesting plan was modified to a "1-of-2" plan. With increases in the number of background samples, a "1-of-2" plan was able to achieve a 'good' effective statistical power level for the site based on the EPA reference power curves.

Expansion of the Background Data Set

The background data set was modified in 2013 to add MW-101A and MW-101B to the upper bedrock and deeper bedrock background data sets, respectively. The statistical analysis methods continued the DQR and "1-of-2" interwell prediction limits as recommended in the Unified Guidance (EPA, 2009), utilizing the pooled data from MW-37 and MW-101A for the upper bedrock system and MW-38 and MW-101B for the deeper bedrock system.

Double Quantification Rule

The DQR will be used to evaluate SSIs over background for the Appendix I and II constituents that were not detected above the reporting limit in the background data sets. An SSI will be indicated for any well-constituent pair with quantified measurements at or above the reporting limit noted for two consecutive sample and resample events. If applicable, the resample will be collected prior to next semiannual sampling event.

Interwell Prediction Limits

Interwell prediction limits will be used to statistically evaluate SSIs over background for the Appendix I and II constituents which have been detected above the reporting limit in the background data set. A "1-of-2" retesting plan will be utilized on individual sample results. The 1-of-2 retesting plan as defined in the Unified Guidance concludes that an SSI has occurred when two out of two sample results exceed the prediction limit, while no SSI is concluded if 1-of-2 are below the limit. If applicable, the resample will be collected prior to next semiannual sampling event. The prediction limit for each constituent will be recalculated semiannually.

For interwell constituents with less than or equal to 50% detects in the background data set, a non-parametric prediction limit will be utilized. The non-parametric prediction limit will be taken as the maximum order statistic (maximum value) of the background data.

For interwell constituents with greater than 50% detects in the background data set, normality assumptions will be verified using the Shapiro-Wilk normality test. If the background data is not normally distributed, a non-parametric prediction limit will be utilized (as described in the paragraph above). If the background data is normally distributed or can be fit to a normal distribution utilizing a normalizing transformation, then a normal-based parametric prediction limit will be applied.

When considering a lognormal prediction limit, a comparison will be made to the maximum order statistic for the background data set. Lognormal prediction limits can be sensitive to smaller departures from lognormality. That is, if data are not truly lognormal, but also not rejected as lognormal, the prediction limit may be inflated because of the transformation. In choosing a lognormal limit, in addition to the percent detections and lognormal goodness of fit criteria, an additional convention will be applied. If the lognormal limit exceeds the level of twice the maximum background concentration, it is assumed that the lognormal model does not adequately fit the background distribution and a non-parametric prediction limit will be selected.

For interwell constituents with 50% to 85% detects in the background data set, Kaplan-Meier estimation will be applied to manage statistical bias introduced by non-detects. For interwell constituents with over 85% detects in the background data set, half the reporting limit will be used for non-detect data. These estimation methods follow Unified Guidance recommendations and are given in detail in Unified Guidance Chapter 15 (EPA, 2009).

The parametric prediction limit will be calculated as:

$$PL = \bar{x} + k \cdot s$$

where $\bar{x}$ is the sample mean of the August 2008 through current event background data, *s* is the sample standard deviation, and *k* is the multiplier obtained from the Unified Guidance Table 19-1 (EPA, 2009) for 1-of-2 interwell prediction limits on observations. In determining *k*, the number of constituents of concern (COCs) for formal statistical evaluation along with the number of downgradient wells need to be identified. Per the basic subdivision discussion presented in Section 19.2.1 of the Unified Guidance, along with the discussion regarding the use of the appendix tables for parametric retesting plans given on pages 19-13 through 19-15 of the Unified Guidance (EPA, 2009), the *k*-multiplier is chosen based on the number of constituents, wells, and evaluations performed annually. When an exact well and COC configuration is not given in the appendix tables, the *k*-multiplier is linearly interpolated as described on page 19-14 of the Unified Guidance (EPA, 2009).

Sanitas® v9.6. software (Sanitas Technologies) will be used to check distributional assumptions, perform Kaplan-Meier in the case of 50% to 85% detects in the background data set, and calculate the *k*-multipliers and subsequent prediction limits.

Intrawell Prediction Limits

Intrawell prediction limits are calculated in a similar manner to that described above for the interwell case. A main difference between the two methods is the intrawell limit is calculated from a collection of background measurements within the compliance well. A minimum of eight compliance well background samples will be used when calculating the limit.

A second difference is for the parametric prediction limit, in which the *k*-multiplier is modified from the interwell case, as given in Appendix D Tables 19-10 through 19-18 of the Unified Guidance (EPA, 2009).

Updating intrawell background is performed periodically. The Unified Guidance (Section 5.3.2) recommends that 4 to 8 new compliance observations be collected prior to updating the background dataset. The guidance also states that "a potential update is predicated on there being no statistically significant increase [SSI] recorded for that well constituent, including since the last update." A two-sample t-test or Wilcoxon rank-sum test between existing intrawell background data and the potential set of newer background data is performed, and a non-significant result (α = 0.05) implies that the newer compliance data can be re-classified as background measurements.

For Wilcoxon rank-sum tests, non-detect results cannot be ranked with certainty and the problem is compounded with multiple PQLs and/or J-flagged values (EPA, 2009). In comparisons where a substantial fraction of non-detect and/or J-flagged measurements or changing PQLs occur, professional judgment will be utilized for evaluating significant differences between the existing intrawell background data and the potential newer set of background data. Consideration will be given to whether significant differences are due to artificial variation introduced by censored data.

2. Comparison to Groundwater Protection Standard – Assessment Monitoring

According to IAC 113.10(6)f and g, under the assessment monitoring program Appendix II results which have been determined to be statistically above background are also statistically compared to the GWPS. If "Appendix II constituents are detected at statistically significant levels above the GWPS" a notice is placed in the operating record and characterization is begun.

Under IAC 113.10(6)h, the GWPS is the maximum contaminant level (MCL) promulgated under Section 1412 of the Safe Drinking Water Act in 40 Code of Federal Regulations (CFR) Part 141. If no MCL exists, or if background concentrations are higher than the MCL, the GWPS is defined as background. Also, per IAC 113.10(6)i, an alternative GWPS may be established by the department for constituents for which there is no MCL such as the "health-based concentrations that comply with the statewide standards for groundwater established pursuant to 567 IAC Chapter 137."

When the GWPS is background concentrations, the statistical methods discussed in the above "1. Comparison to Background" are used. When the GWPS is the MCL or an alternative health-based concentration, per the Unified Guidance (EPA, 2009), "confidence intervals are the recommended general statistical strategy in compliance/assessment or corrective action monitoring." In the case of normally distributed data, a normal-based parametric confidence interval is used. If the data are not normally distributed a non-parametric confidence interval on the median is used. A lower 99% confidence limit falling above the GWPS implies that concentrations are detected at statistically significant levels above the GWPS with an α-level of 0.01, which is the minimum RCRA regulatory limit from §264.97(i)(2) for an individual test false positive error rate.

The Unified Guidance recognizes that statistical power is also of prime concern to EPA and that there "should be a high probability that the statistical test will positively identify concentrations that have exceeded a fixed regulatory standard." In compliance/assessment monitoring, instead of pre-specifying the false positive rate prior to computing confidence interval limits, the Unified Guidance suggests the desired level of power (1-β) should be set as an initial target.

For compliance/assessment monitoring purposes, the Unified Guidance (Chapter 22) suggests evaluating increases in the true concentration mean of 1.5 and 2.0 times a fixed standard. (This is similar in concept to the critical power targets in detection monitoring, i.e., 55-60% power at 3σ above background and 80-85% power at 4σ over background). As a general guide, the Unified Guidance suggests there should be at least 70-80% statistical power for detecting increases of 2 times a fixed standard. Specifically, the Unified Guidance recommends there be 50% power of detecting increases in the true concentration mean of 1.5 times a fixed standard (risk ratio of 1.5) and 80% power of detecting increases in the true concentration mean of 2.0 times a fixed standard (risk ratio of 2.0).

To meet these levels of statistical power, α is chosen based on either Unified Guidance Equation 22.1:

$$1 - \beta = G_{T,n-1}\left(t_{1-\alpha,n-1}\middle|\Delta - \sqrt{n}(R-1)\right);$$

where R is the desired risk ratio, $t_{(1-\alpha,n-1)}$ is the (1−α) Student's t-quantile with (n−1) degrees of freedom and G represents the cumulative non-central t-distribution with (n−1) degrees of freedom and noncentrality parameter Δ;

or Unified Guidance Equation 22.2:

$$\alpha \sim 1 - F_{T,n-1}\left(\frac{(R-1)\sqrt{n}}{R\cdot\widehat{CV}} - t_{1-\beta,n-1}\right);$$

where R is the desired risk ratio, n is the sample size, CV is the estimated sample coefficient of variation, $t_{(1-\beta,n-1)}$ is the (1−β) Student's t-quantile with (n−1) degrees of freedom, and F is the cumulative (central) Student's t-distribution function.

The first equation (Unified Guidance Equation 22.1) assumes a coefficient of variation (CV) =1. This version is used if only poorer estimates of the true CV are available. In practice, a convention has been adopted with the statistical updates to utilize Unified Guidance Equation 22.2 in all cases where a parametric confidence interval is calculated and use Unified Guidance Equation 22.1 when non-parametric confidence intervals are calculated. Since a non-parametric confidence interval is based on the median, it is not as sensitive to departures from normality, and the assumption of a CV=1 in Unified Guidance Equation 22.1 should provide a conservative estimate.

Since 0.01 is the minimum RCRA regulatory limit for α, it is never set lower than this. Conversely, the Unified Guidance recognizes the "difficulty of simultaneously attaining the recommended level of power while controlling the false positive rate, especially for small sample sizes and highly variable data." The Unified Guidance suggests a maximum false positive rate of α=0.2 is a reasonable upper bound.

Finally, like the need for defining a SWFPR under detection monitoring, the Unified Guidance (Chapter 7) recognizes there may be concern about the "use of relatively high individual test-wise false positive rates (α) in order to meet a pre-specified power, especially when considering the cumulative false positive error rate across multiple wells and/or constituents." However, "the Unified Guidance considers computation of cumulative SWFPRs in compliance/assessment testing to be problematic, and reliance on individual test false positive rates preferable." Notwithstanding, if several confidence limit calculations are compared to the GWPS with high α-levels, caution should be taken in the interpretation.

For calculation of confidence intervals, Sanitas® v9.6 software is again used to check distributional assumptions, perform Kaplan-Meier estimation in the case of 50% to 85% detects, and calculate either parametric or nonparametric confidence limits.

3. <u>Comparison to Groundwater Protection Standard – Corrective Action Monitoring</u>

As stated above, if "Appendix II constituents are detected at statistically significant levels above the GWPS" a notice is placed in the operating record and characterization is begun. Owners or operators are required to initiate an assessment of corrective measures, select a remedy, and implement a remedy in accordance with IAC 113.10(7), (8), and (9). For remedy completion in accordance with IAC 113.10(9)e(2), compliance with the GWPS is considered achieved by demonstrating that concentrations of Appendix II constituents have not exceeded the GWPS for

a period of three consecutive years or an alternate length of time established by the Department.

Starting with the Fall 2019 statistical evaluation, individual analyte/well pairs may return to assessment constituents (at the corrective action monitoring location) once compliance with the GWPS has been achieved for a period of 3 years. Note that monitoring wells will not move out of the corrective action monitoring program until all Appendix II constituents have achieved compliance with the GWPS for a period of three consecutive years.

Confidence Intervals in Corrective Action Mode

In the case of the GWPS being a fixed standard as either the 40 CFR Part 141 Safe Drinking Water Act MCL or the IAC 567 Chapter 137 Statewide Standard for a Protected Groundwater Source, "confidence intervals are the recommended general statistical strategy in compliance/assessment or corrective action monitoring" (EPA, 2009). However, a primary difference between confidence intervals as used under assessment monitoring and confidence intervals used under corrective action is reversal of the null hypothesis. As detailed in Section 7.2 of the Unified Guidance (EPA, 2009), the hypothesis testing structure under assessment monitoring is to presume compliance point concentrations do not to exceed the fixed standard unless sampling data indicates otherwise. As a formal statistical hypothesis, this is written as:

$$H_0: \Theta \leq G \quad \text{vs.} \quad H_A: \Theta > G$$

In corrective action mode, the hypothesis is reversed. Namely, compliance point concentrations are presumed to exceed the fixed standard and evidence must be presented to demonstrate regulatory compliance. In the case of corrective action, the statistical hypothesis is written as:

$$H_0: \Theta > G \quad \text{vs.} \quad H_A: \Theta \leq G$$

For testing under assessment monitoring, a lower confidence limit (LCL) is compared to the compliance standard *G*. If the LCL is larger than the standard *G*, it is concluded that the compliance standard has been violated.

However, under corrective action monitoring, the upper confidence limit (UCL) is compared to the compliance standard G. In this case, the UCL should lie below the standard to accept the alternative hypothesis that concentration levels are in compliance.

The UCL α-level under corrective action monitoring is set so that a high degree of confidence is achieved in declaring successful remediation. Per the Unified Guidance (Section 7.4.2) "EPA's overriding concern in corrective action is that remediation efforts are not declared successful without sufficient statistical proof." The Unified Guidance "recommends the use of a reasonably low, fixed test-wide false positive rate (e.g., α = 0.05 or 0.10)." In this case, α = 0.10 corresponds to a 90% UCL.

GWPS as Background

Pursuant to IAC 113.10(6)h, when background concentrations of an analyte exceed the applicable MCL or IAC Statewide Standard for a Protected Groundwater Source, the GWPS is the background concentration. In this case, the GWPS is not a fixed standard but based on a distribution of background sample results.

Section 7.5 of the Unified Guidance (EPA, 2009) details statistical hypothesis testing under corrective action when the GWPS is background. The Unified Guidance offers two alternative statistical approaches to hypothesis testing in this case. These alternatives are as follows:

A. The first represents a *two-sample* test of two distinct populations, namely the compliance well to background populations. Similar to the statistical tests used under detection and assessment monitoring, with this alternative under corrective action, the Unified Guidance states that "one highly recommended statistical test approach is a prediction limit." The Unified Guidance also states, "whatever the critical value for a selected background test, it becomes the GWPS under compliance/assessment or corrective action monitoring." Further, "the only allowable hypothesis test structure for the two-sample approach follows that of detection and compliance monitoring. Once exceeded and in corrective action, a return to compliance is through evidence that future samples lie below the GWPS using the same hypothesis structure." Therefore, with this approach in corrective action, prediction limits are calculated similarly as in assessment monitoring. Compliance well concentrations below a prediction limit indicate a return to concentrations below the background GWPS.

B. The second involves computation of a fixed statistic from the background data as the GWPS. The Unified Guidance recommendation in this case is to define a fixed GWPS based on a background upper tolerance limit with 95% confidence and 95% coverage. This is designed to be a "reasonable maximum on the likely range of background concentrations." This upper tolerance limit based on background data is then used as a fixed standard in statistical comparisons with 90% or 95% UCLs from compliance wells as discussed previously. Also, with the UCL method, the null hypothesis is reversed from that of assessment monitoring, assuming contamination is above the GWPS. A UCL falling below the background GWPS offers evidence of a return to concentrations below the GWPS. The Unified Guidance refers to this approach as a *single-sample* testing method, since the compliance well population is tested against a defined fixed standard.

The Unified Guidance discusses tradeoffs between the two approaches and does not necessarily prescribe either approach over the other. The Unified Guidance suggests that both approaches may be used, where "the background GWPS would be a range based on the two testing methods rather than a single value."

<u>Normality</u>
For calculation of confidence intervals, Sanitas® v9.6 software is again used to check distributional assumptions, perform Kaplan-Meier estimation in the case of 50% to 85% detects, and calculate either parametric or nonparametric confidence limits. "Corrective Action Mode" is selected for this analysis.

<u>Non-Corrective Action Constituents</u>
As recommended in the Unified Guidance (EPA, 2009), confidence intervals in corrective action mode will be utilized to evaluate only constituents and monitoring locations with previously identified SSLs over the GWPS. Other compliance constituents (i.e., those without SSLs over the GWPS during prior statistical evaluations) will continue to be evaluated using the "<u>1. Comparison to Background</u>" and "<u>2. Comparison to Groundwater Protection Standard – Assessment Monitoring</u>" methods described above.

Note: The Unified Guidance (EPA, 2009) states: “it should be recognized that once corrective action or remediation activities are initiated, there will be a considerable time during which the GWPS may still be exceeded. As provided in the RCRA regulations, it is at the conclusion of remediation activities that formal corrective action monitoring evaluation is appropriate. However, in the intervening period of remedial activity, well constituents can still be monitored, and the relative efficacy of remediation measures tracked. The same corrective action hypothesis can be assumed for the targeted constituents; techniques such as trend testing may be appropriate interim applications.” Given the statement above and the intentions of IAC 113.10(6)g, as soon as an SSL is identified for an assessment monitoring constituent/location, then the next statistical evaluation will utilize corrective action monitoring (confidence intervals in corrective action mode).

Data Concentration Shifts During Corrective Action

Confidence intervals assume that the population is stable over time. As a result, confidence intervals may not accurately represent the current well concentrations if increasing or decreasing trends are observed (i.e., during a release or under active remediation). Per the Unified Guidance (EPA, 2009), lower or upper confidence limits constructed on accumulated data may be overly wide (due to high sample variability caused by combining pre- and post-shift data) and may not be reflective of more recent upward/downward shifts in the contaminant distribution.

Alternative procedures may be applied to data sets with shifting distributions. For example, where trends tests are significant, pre-shift data may be removed from the well/parameter data set for the purposes of constructing the confidence interval. “The reduction in sample size will often be more than offset by the gain in statistical power. More recent measurements may exhibit less variation around the shifted mean value, resulting in a shorter confidence interval” (EPA, 2009).

Another alternative is to construct confidence bands around the trend line to track progress towards exceeding or meeting a fixed standard. As suggested in the Unified Guidance (Chapter 22), if a trend is present, a 90% confidence band (upper 95% confidence limit) is placed on the linear trend line. If the upper 95% confidence limit on the trend line falls below the GWPS, the well is found to have reduced to levels statistically below the GWPS.

As the discussed in the Unified Guidance, “inferences concerning a linear regression are generally appropriate when two conditions hold: 1) the residuals from the regression are approximately normal or at least reasonably symmetric in distribution; and 2) a plot of residuals versus concentrations indicates a scatter cloud of essentially uniform vertical thickness or width.” These conditions are assessed through normal probability plots of the regression residuals and plots of residuals against the predicted concentrations.

Data Adjustments Due to Exiting Corrective Action

When analyte/well pairs exit corrective action and return to assessment constituents, the hypothesis testing structure is reversed again. In corrective action mode, compliance point concentrations were presumed to exceed the GWPS, and evidence must be presented to demonstrated regulatory compliance (i.e., UCLs below the GWPS for three consecutive years). With the return to assessment constituents, analyte/well pairs have demonstrated regulatory compliance. The hypothesis testing structure reverts to the assessment monitoring structure where compliance point concentrations are presumed to not exceed the GWPS unless sampling

data indicates otherwise (i.e., LCL is above the GWPS). With this reversion in hypothesis, the focus shifts to evaluating concentration changes in the analyte/well pair that would indicate an increase over the GWPS and re-trigger corrective action. For constituents with historical SSLs, earlier concentrations that had previously triggered corrective action are no longer providing useful information regarding the current assessment monitoring hypothesis. Retaining the historical data during the timeframe in which the GWPS was exceeded will result in the regression or confidence interval methods being slower to respond to new increases. As a result, the historical data prior to when statistical compliance with the GWPS was first achieved will be removed when analyte/well pairs exit corrective action and return to assessment constituents.

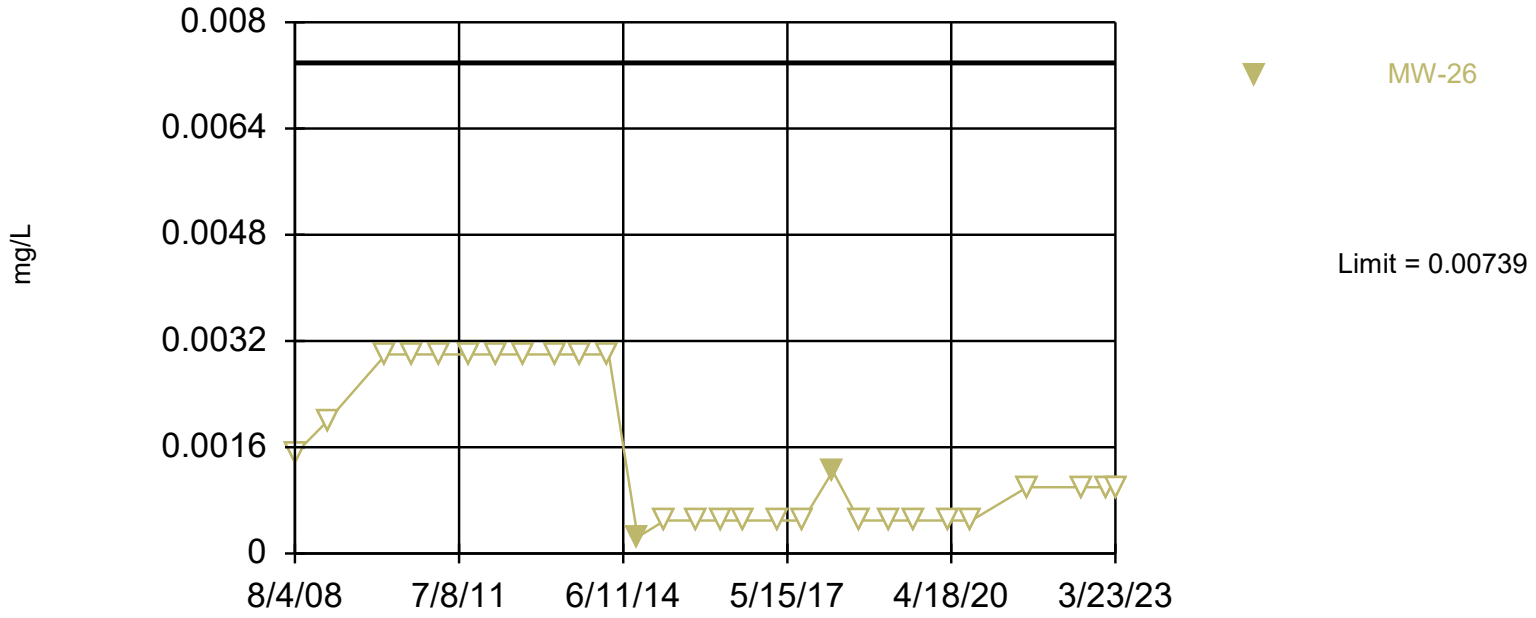
[1] Interwell prediction limit data consists of the detected Appendix I and II parameters in the combined MW-37 and MW-101A data set. Note that background data set adjustments were incorporated in accordance with Section 3.1 of the Spring 2023 Statistical Evaluation memo.



[2] At MW-26, interwell prediction limit comparisons were conducted on the Jan. and Mar. 2023 baseline assessment monitoring event data.

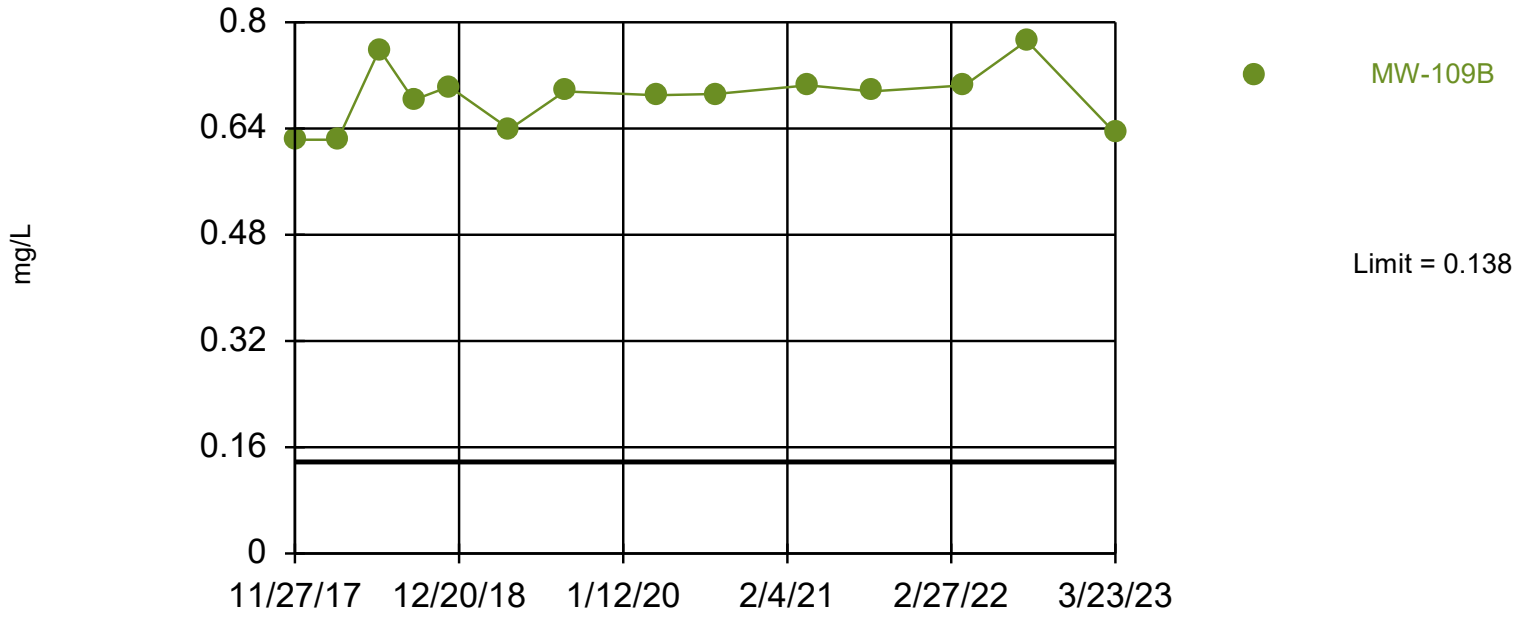
Prediction Limit - Delineation Monitoring Assessment Constituents

Interwell Non-parametric

Non-parametric test used in lieu of parametric prediction limit because censored data exceeded 50%. Limit is highest of 45 background values. 95.56% NDs. Annual per-constituent alpha = 0.03945. Individual comparison alpha = 0.0008745 (1 of 2).



Constituent: Antimony Analysis Run 5/17/2023 9:28 AM

Linn County SWAL Client: Foth Data: Site 1 Deeper Bedrock - Spring 2023 Evaluation

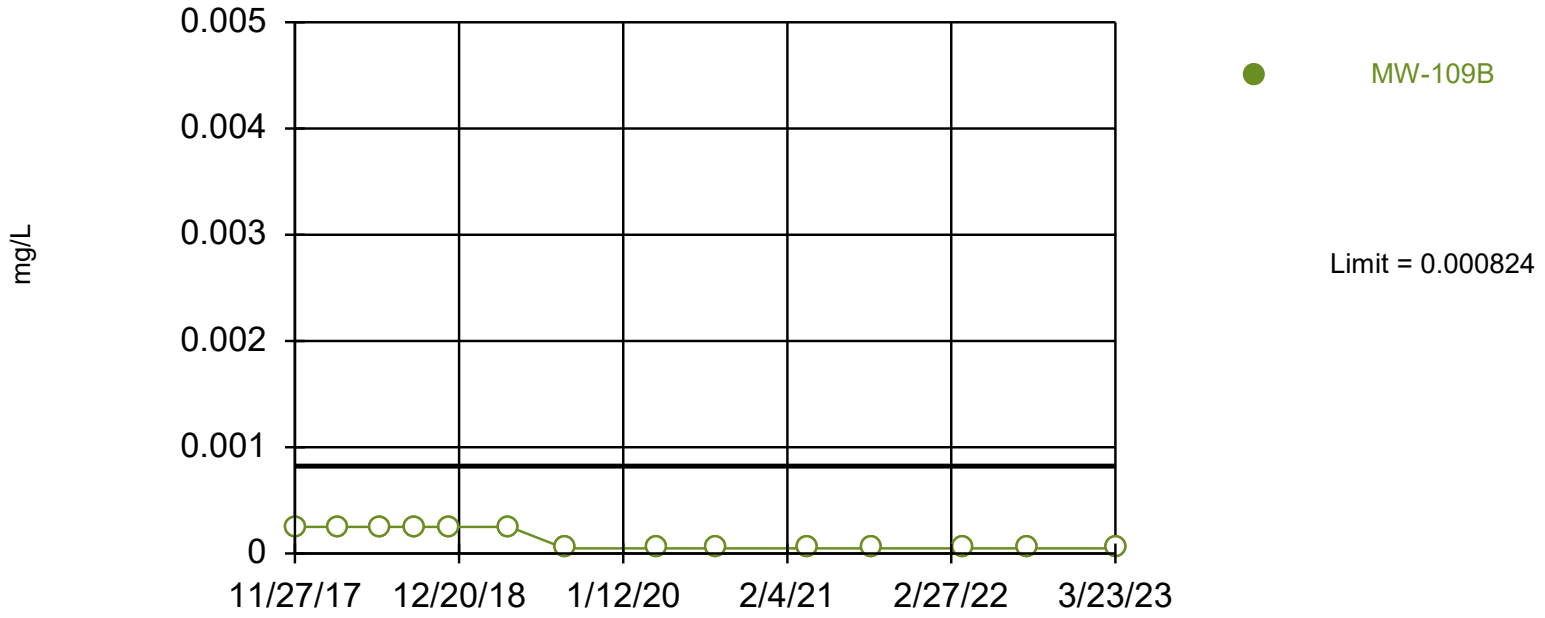
Exceeds Limit: MW-109B

Prediction Limit - Delineation Monitoring Assessment Constituents

Interwell Non-parametric

Non-parametric test used in lieu of parametric prediction limit because the Shapiro Wilk normality test showed the data to be non-normal at the 0.01 alpha level. Limit is highest of 43 background values. Annual per-constituent alpha = 0.0425. Individual comparison alpha = 0.0009437 (1 of 2).

Constituent: Barium Analysis Run 5/17/2023 9:28 AM



Linn County SWAL Client: Foth Data: Site 1 Deeper Bedrock - Spring 2023 Evaluation

Sanitas™ v.9.6.37 Software licensed to Foth Infrastructure & Environment, LLC. UG
Hollow symbols indicate censored values.

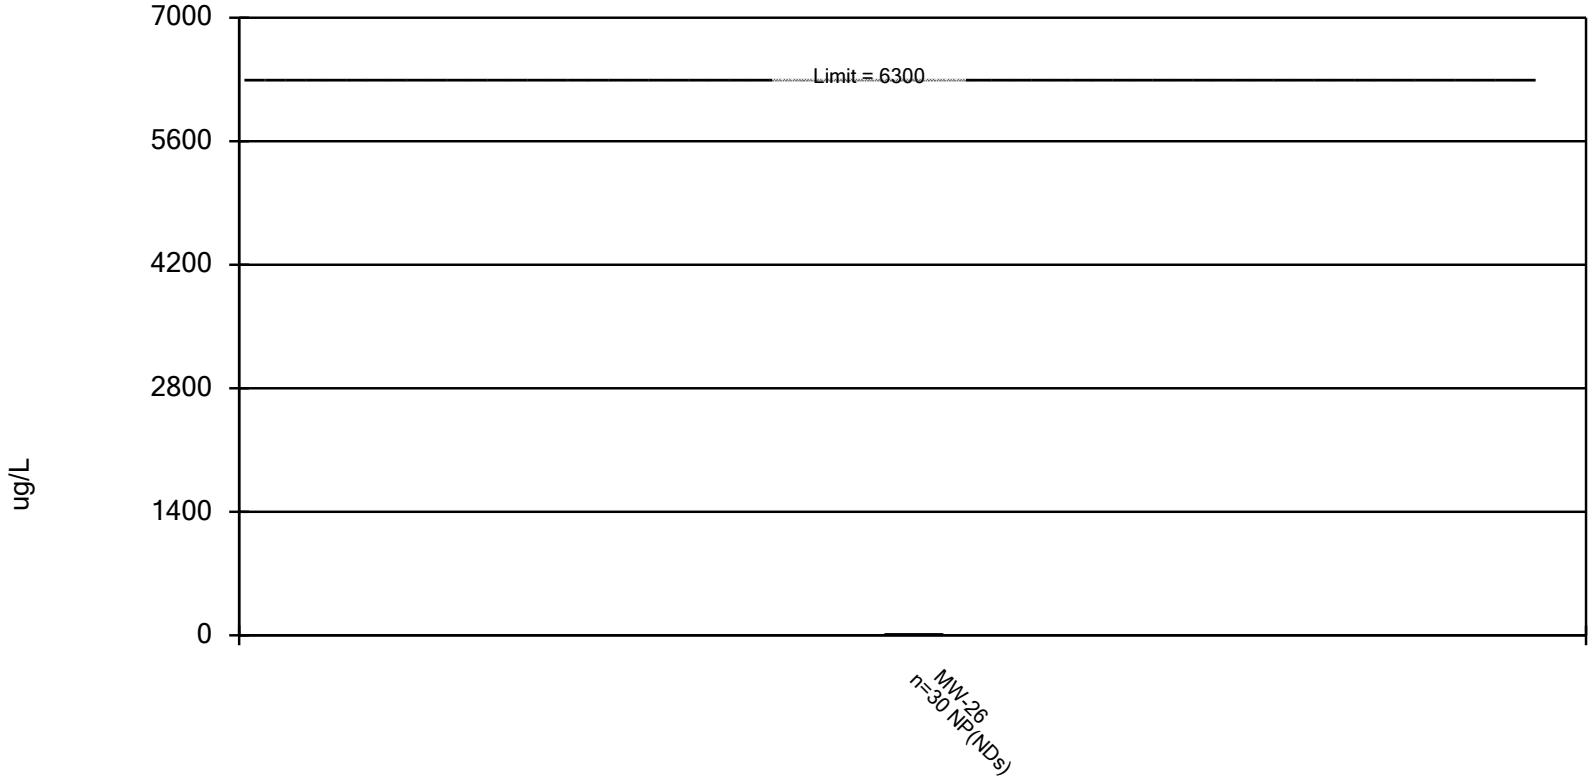
[1] Under assessment mode, an SSL is indicated when the lower confidence limit exceeds the groundwater protection standard (compliance limit).

[2] Value is the 40 CFR Part 141 Safe Drinking Water Act MCL or the IAC 567 Chapter 137 Statewide Standard for a Protected Groundwater Source.



[3] For parametric confidence intervals: Except where otherwise indicated, based on Unified Guidance Equation 22.2, i.e., $\alpha \sim 1 - F_{T,n-1}\left(\frac{(R-1)\sqrt{n}}{R \cdot \widehat{CV}} - t_{1-\beta,n-1}\right)$
where R is the desired risk ratio, n is the sample size, CV is the estimated sample coefficient of variation, $t_{1-b,n-1}$ is the (1−b) Student's t-quantile with (n−1) degrees of freedom, and F is the cumulative (central) Student's t-distribution function.

[4] For non-parametric confidence intervals: Based on Unified Guidance Equation 22.1, i.e., $1-\beta = G_{T,n-1}(t_{1-\alpha,n-1}|\Delta = \sqrt{n}(R-1))$
where R is the desired risk ratio, $t_{1-a,n-1}$ is the (1−a) Student's t-quantile with (n−1) degrees of freedom and G represents the cumulative non-central t-distribution with (n−1) degrees of freedom and noncentrality parameter D.

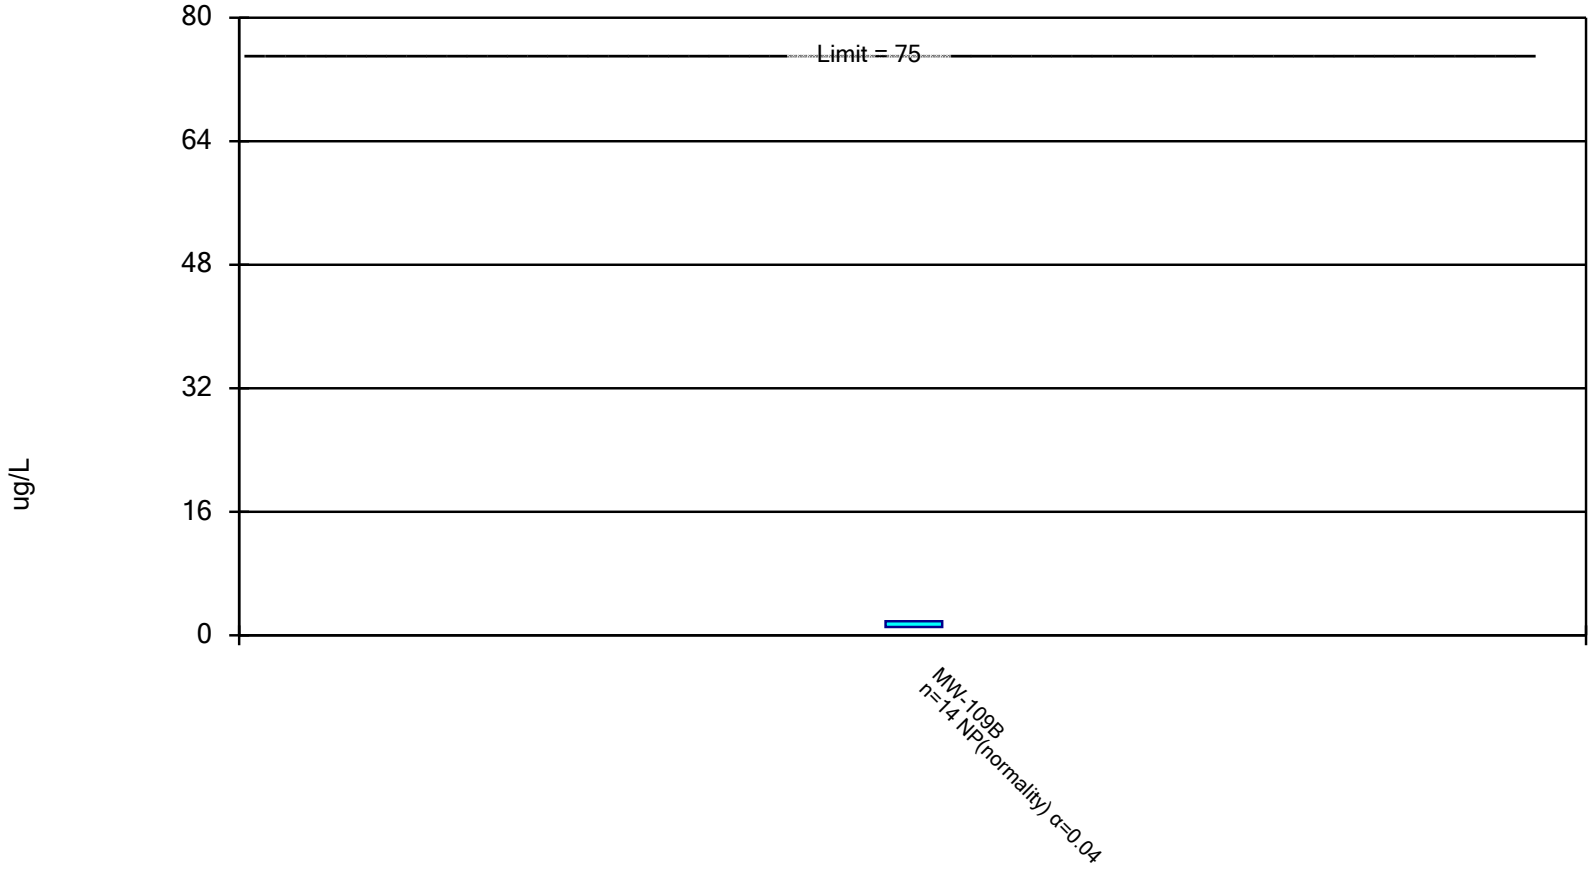
[1] Under assessment mode, an SSL is indicated when the lower confidence limit exceeds the groundwater protection standard (compliance limit).

[2] Value is the 40 CFR Part 141 Safe Drinking Water Act MCL or the IAC 567 Chapter 137 Statewide Standard for a Protected Groundwater Source.

[3] For parametric confidence intervals: Except where otherwise indicated, based on Unified Guidance Equation 22.2, i.e., $\alpha \sim 1 - F_{T,n-1}\left(\frac{(R-1)\sqrt{n}}{R + \widehat{CV}} - t_{1-\beta,n-1}\right)$

where R is the desired risk ratio, n is the sample size, CV is the estimated sample coefficient of variation, $t_{1-b,n-1}$ is the (1–b) Student's t-quantile with (n–1) degrees of freedom, and F is the cumulative (central) Student's t-distribution function.



[4] For non-parametric confidence intervals: Based on Unified Guidance Equation 22.1, i.e., $1 - \beta = G_{T,n-1}\left(t_{1-\alpha,n-1} \middle| \Delta = \sqrt{n}(R-1)\right)$

where R is the desired risk ratio, $t_{1-a,n-1}$ is the (1–a) Student's t-quantile with (n–1) degrees of freedom and G represents the cumulative non-central t-distribution with (n–1) degrees of freedom and noncentrality parameter D.

RE: Site 1 Statistical Analysis - Fall 2023 Evaluation

1 Memorandum Organization

This memo addresses the statistical analysis of the groundwater monitoring data collected in August 2023. The statistical methods and results are summarized, with the memo organization given as follows:

2 Background

The groundwater monitoring locations and status of the Appendix I and II sampling schedules are summarized on Tables 1 and 2. The Appendix I and II analytical results will be provided in Table 14 of the 2023 Annual Water Quality Report (AWQR).

Table 1
Upper Bedrock Monitoring Locations and Schedule
Aug. 2008 – Aug. 2023 Appendix I & II Data

Monitoring Location	Monitoring Program	Current Schedule [1] (Aug. 2023)	Appendix I Initiated	# Events to Complete Baseline Appendix I or Completion Date [113.10(5)b]	Appendix II Initiated	# Events to Complete Baseline Appendix II or Completion Date [113.10(6)b]	Returned to Detection Monitoring (Yes/No)

N/A = Not applicable. Monitoring points were under routine parameter sampling per 567 IAC 113.2(5) prior to initiation of Appendix II.

[1] Appendix II locations were sampled for the Appendix I and detected Appendix II constituents in Aug. 2023. Resampling for the full Appendix II list at the assessment, corrective action, and background monitoring wells is conducted every five years.

[2] Six rounds of background monitoring for the Appendix II metals were conducted at MW-101B between Sep. 2013 and Mar. 2015. Two rounds of background monitoring for the full Appendix II list were conducted in Sep. 2015 and Mar. 2016.

[3] IDNR approved retaining MW-104B as an arsenic delineation monitoring well in the letter dated May 12, 2016 (IDNR, 2016).

[4] IDNR approved the removal of cobalt from the list of analytes at MW-108B in the letter dated Apr. 16, 2019 (IDNR, 2019).

In August 2023, semiannual corrective action, background, and delineation monitoring was conducted at upper bedrock wells MW-12, MW-13, MW-16, MW-17, MW-32, MW-37, and MW-101A and deeper bedrock wells MW-14, MW-33, MW-38, MW-101B, and MW-109B. In accordance with Permit Amendment #16, annual detection, assessment, corrective action, and delineation monitoring was also conducted in August 2023 at upper bedrock wells AW-1, AW-2,

AW-3, AW-4, AW-5, MW-20, MW-21, MW-23, MW-24, MW-26, MW-28, MW-30, MW-34, MW-35, VP-3, VP-4, MW-105A, MW-106A, MW-107A, and MW-109A and deeper bedrock wells AW-6, CRL-9, MW-11, MW-15, MW-18, MW-19, MW-22, MW-25, MW-31, MW-36, MW-102B, MW-104B, MW-105B, MW-107B, and MW-108B. Assessment, corrective action monitoring, and background locations were sampled for the Appendix I and detected Appendix II constituents in August 2023. In accordance with Permit Amendment #6, resampling for the full Appendix II list at the assessment, corrective action, and background monitoring wells is conducted every five years. The next full Appendix II resampling dates will be provided in Table 2 of the 2023 Annual Water Quality Report (AWQR).

Under the detection and assessment monitoring programs of 567 IAC 113.10(5) and 113.10(6), Appendix I and II monitoring results are statistically compared to background levels as given in 567 IAC 113.10(6)e and to the groundwater protection standard (GWPS) as given in 567 IAC 113.10(6)g and h. A well may return to detection monitoring when all Appendix II constituents are "shown to be at or below background values, using the statistical procedures in paragraph 113.10(4)g for two consecutive sampling events." Consequently, to return to detection monitoring in accordance with 567 IAC 113.10(6)e, all Appendix II constituents must be below the interwell prediction limit (for constituents which are detected in the background data set) or below the laboratory reporting limit (for constituents which are not detected in the background data set) during two consecutive sampling events. As mentioned in previous memos, three consecutive sampling events may be utilized to make the determination to return to detection monitoring to limit frequent fluctuation of wells moving between the detection and assessment monitoring programs. Assessment monitoring continues when Appendix II concentrations are above background values but below the GWPS using the statistical procedures in paragraph 113.10(4)g.

If Appendix II constituents are detected at statistically significant levels (SSLs) above the GWPS, characterization [567 IAC 113.10(6)g] is initiated and the owners or operators are required to begin an assessment of corrective measures, select a remedy, and implement a remedy in accordance with 567 IAC 113.10(7), (8), and (9). For remedy completion [567 IAC 113.10(9)e(2)], compliance with the GWPS is considered achieved by demonstrating that concentrations of Appendix II constituents have not exceeded the GWPS for a period of three consecutive years or an alternate length of time established by the IDNR.

Based on the August 2008 through August 2023 results, this memo presents an evaluation of statistically significant increases (SSIs) and SSLs under the requirements of paragraphs 113.10(4)g and h of 567 IAC.

3 Statistical Methodology

The statistical methods utilized for locations in detection, delineation, assessment, and corrective action monitoring were consistent with the methods used in previous statistical evaluations. Detailed descriptions of the statistical methods are provided in Attachment 1. Sanitas® v10.0 (Sanitas Technologies) software was utilized to complete the statistical comparisons.

The combined background data sets (MW-37 and MW-101A for the upper bedrock, and MW-38 and MW-101B for the deeper bedrock) were utilized to evaluate SSIs over background.

3.1 Background Data Set Adjustments

3.1.1 Adjustments Associated with Turbidity and Total Suspended Solids

No background data set adjustments are recommended for MW-37, MW-38, MW-101A, and MW-101B based on review of the field turbidity and total suspended solids (TSS) data from the August 2023 sampling event. The August 2023 TSS concentrations at MW-37, MW-38, MW-101A, and MW-101B were below the 5 mg/L limit for acceptable sample quality.

The background data set adjustments previously recommended and incorporated based on review of turbidity data include:

- Removal of the high volume September 2009 through September 2014 metals data at MW-101A (initiated with Fall 2016 statistical evaluation).
- Removal of the high volume September 2009 through September 2014 and the initial low-flow March 2015 metals data at MW-101B (initiated with Fall 2016 statistical evaluation).
- Removal of the March 2019 barium concentration in MW-38 due to elevated TSS and the potential for turbidity to contribute to the higher barium concentration identified (initiated with Spring 2019 statistical evaluation).
- Removal of the March 2023 barium, cadmium, cobalt, copper, nickel, selenium, and vanadium concentrations in MW-101A due to elevated TSS and the potential for turbidity to contribute to the higher concentrations identified (initiated with the Spring 2023 statistical evaluation).

These data set adjustments were maintained in the current statistical evaluation. The removed background data will be listed as crossed out concentrations in Table 14 of the 2023 AWQR.

Note that the historical high-volume data at the downgradient wells continue to be reviewed on a case-by-case basis. The downgradient data set review is discussed in Section 5.1.

3.1.2 Adjustments Associated with Practical Quantitation Limits

Due to lowering of the practical quantitation limits (PQLs), background data set adjustments were approved to remove earlier non-detect data with elevated PQLs for barium, cobalt, copper, and lead in the upper bedrock and for barium, beryllium, cadmium, cobalt, copper, lead, and nickel in the deeper bedrock due to the increased uncertainty the elevated PQLs added. IDNR approved the background dataset adjustments due to elevated PQLs in the letters dated May 12, 2016 and November 20, 2017 (IDNR, 2016 and 2017). These data set adjustments were maintained in the current statistical evaluation.

3.1.3 Review of Single Background Detections

During the September 2015 event, m/p-cresol and phenol were detected above the laboratory reporting limit at upper bedrock background well MW-37. These two constituents have not been detected in either background well prior to or after the September 2015 event. As a result, m/p-cresol and phenol will not be evaluated using prediction limits unless additional background detections are identified. Downgradient m/p-cresol and phenol results will be evaluated using the double quantification rule (DQR).

Single volatile organic compound (VOC) detections were identified for carbon disulfide and toluene in MW-37 in August 2017. In November 2017, retest samples were collected, which did not confirm the November 2017 detections. As a result, it was determined that MW-37 remained suitable as a background well. The only other detections in MW-37 during the August 2017 event were for barium and cobalt. The August 2017 barium and cobalt concentrations were within the range of historical concentrations for these constituents at MW-37. Therefore, the barium and cobalt results were maintained in the background data set for calculating interwell prediction limits. Since VOCs are considered "never detected" constituents, carbon disulfide and toluene were not added as prediction limit constituents. Downgradient carbon disulfide and toluene results continue to be evaluated using the DQR.

Similarly, single VOC detections were identified for benzene, ethylbenzene, toluene, and total xylenes (BTEX) in MW-37 during the Fall 2018 sampling event. The August 2018 detected metals data at MW-37 was removed from the background dataset due to the potential impact indicated by the BTEX detections. A retest sample was collected for BTEX in background well MW-37 in November 2018. The retest results did not confirm the August 2018 BTEX detections; therefore, SSIs were not declared. In addition, the retest results indicated that MW-37 remained suitable for continued use as a background well for the upper bedrock system. Since VOCs are considered "never detected" constituents, the BTEX constituents were not added as prediction limit constituents. Downgradient BTEX results continue to be evaluated using the DQR.

3.2 Corrective Action Constituents

In accordance with the Unified Guidance (USEPA, 2009), corrective action statistics are conducted for analyte/well pairs with previously identified SSLs, as listed in Table 3. In accordance with 567 IAC 113.10(9)e(2), arsenic in MW-20 returned to an assessment constituent in Fall 2023 since concentrations were statistically below the GWPS for three consecutive years during the Fall 2022 statistical evaluation. Therefore, arsenic in MW-20 has been removed from Table 3. No corrective action constituents exited corrective action and no new corrective action constituents were added based on the results of the previous Spring 2023 statistical evaluation.

Under corrective action statistics, comparisons to background are not conducted (except for cobalt in the upper bedrock under the corrective action hypothesis, further discussed in Section 5.2); therefore, the analyte/well pairs listed in Table 3 were not included in the Section 4 comparisons to background.

Table 3
Corrective Action Constituents [(1)]

Monitoring Location	Corrective Action Constituents [(2)]
Upper Bedrock Monitoring Locations	
AW-1	Arsenic
AW-2	Arsenic, Thallium
MW-12	Arsenic
MW-13	Arsenic
MW-16	Arsenic
MW-17	Arsenic
MW-20	Thallium
MW-24	Arsenic
MW-30	Arsenic
MW-32	Arsenic

Table 3 Continued
Corrective Action Constituents [1]

Monitoring Location	Corrective Action Constituents [2]
Upper Bedrock Monitoring Locations Continued	
MW-34	Arsenic, Vinyl Chloride
MW-35	Cobalt
MW-105A	Cobalt
MW-106A	Arsenic, Cobalt
Deeper Bedrock Monitoring Locations	
AW-6	Cobalt
CRL-9	Arsenic, Cobalt
MW-14	Arsenic
MW-22	Arsenic, Cobalt
MW-33	Arsenic
MW-36	Arsenic
MW-105B	Cobalt
MW-109B	Arsenic; Cobalt; Thallium

[1] Table 3 lists the analyte/well pairs identified as corrective action constituents regardless of whether the monitoring location was sampled during the current event.
[2] Corrective action constituents are analyte/well pairs with SSLs over the GWPS identified during previous statistical evaluations and have not achieved compliance with the GWPS in accordance with 567 IAC 113.10(9)e(2).

4 Comparison to Background Levels

Comparisons to background levels were conducted using interwell prediction limits and the DQR. As noted in Section 3.2, comparisons to background were not conducted for the corrective action constituents listed in Table 3.

4.1 Interwell Prediction Limits

Interwell prediction limits were used for formal statistical assessment of SSIs over background for analytes that have been detected above the reporting limit in the combined background data set (MW-37 and MW-101A for the upper bedrock system; MW-38 and MW-101B for the deeper bedrock system). For the upper bedrock, these analytes included antimony, arsenic, barium, cobalt, copper, lead, nickel, tin, and zinc. For the deeper bedrock, these analytes included antimony, arsenic, barium, bis(2-ethylhexyl)phthalate, cadmium, cobalt, copper, nickel, tin, and zinc.

4.1.1 Upper Bedrock

The upper bedrock prediction limits calculated utilizing August 2008 through August 2023 sample data are summarized in Table 4. The background data set adjustments discussed in Section 3.1 were utilized.

Table 4
Prediction Limit Summary - Upper Bedrock
Aug. 2008 – Aug. 2023 Interwell Data [1]

Chemical Name	Prediction Limit	Units	Prediction Limit Type	Retesting Plan	Prediction Limit Method
Antimony	0.00739	mg/L	Non-Parametric	1-of-2	Maximum Order Statistic
Arsenic	0.00205	mg/L	Non-Parametric	1-of-2	Maximum Order Statistic
Barium	0.1166	mg/L	Parametric (Lognormal)	1-of-2	$\exp(\bar{y} + k \cdot s_y)$
Cobalt	0.008	mg/L	Non-Parametric	1-of-2	Maximum Order Statistic
Copper	0.0225	mg/L	Non-Parametric	1-of-2	Maximum Order Statistic
Lead	0.00695	mg/L	Non-Parametric	1-of-2	Maximum Order Statistic
Nickel	0.0522	mg/L	Non-Parametric	1-of-2	Maximum Order Statistic
Tin [2]	0.152	mg/L	Non-Parametric	1-of-2	Maximum Order Statistic
Zinc	0.0805	mg/L	Non-Parametric	1-of-2	Maximum Order Statistic

[1] Interwell data consists of the Appendix I and II parameters that have been detected in the combined background data set (MW-37 and MW-101A). Note that background data set adjustments were incorporated in accordance with Section 3.1.
[2] Tin was included only for assessment and corrective action monitoring locations.

Non-parametric prediction limits were used for antimony, arsenic, cobalt, copper, lead, nickel, tin, and zinc since either normality assumptions could not be met or there were less than 50% detects in the combined background data. A parametric lognormal prediction limit was used with barium since there were greater than 50% detects in the combined background data set, the assumptions of normality were met with a lognormal transformation, and the lognormal limit was accepted as being representative of the background distribution.

4.1.2 Deeper Bedrock

Deeper bedrock prediction limits calculated from August 2008 through August 2023 sample data are summarized in Table 5. The background data set adjustments discussed in Section 3.1 were utilized.

Table 5
Prediction Limit Summary - Deeper Bedrock
Aug. 2008 – Aug. 2023 Interwell Data [1]

Chemical Name	Prediction Limit	Units	Prediction Limit Type	Retesting Plan	Prediction Limit Method
Antimony	0.0101	mg/L	Non-Parametric	1-of-2	Maximum Order Statistic
Arsenic	0.00225	mg/L	Non-Parametric	1-of-2	Maximum Order Statistic
Barium	0.138	mg/L	Non-Parametric	1-of-2	Maximum Order Statistic
Bis(2-ethylhexyl) phthalate [2]	25.4	ug/L	Non-Parametric	1-of-2	Maximum Order Statistic
Cadmium	0.000824	mg/L	Non-Parametric	1-of-2	Maximum Order Statistic
Cobalt	0.0008831	mg/L	Parametric (Lognormal)	1-of-2	$\exp(\bar{y} + k \cdot s_y)$
Copper	0.0108	mg/L	Non-Parametric	1-of-2	Maximum Order Statistic
Nickel	0.00735	mg/L	Non-Parametric	1-of-2	Maximum Order Statistic
Tin [2]	0.109	mg/L	Non-Parametric	1-of-2	Maximum Order Statistic
Zinc	0.0366	mg/L	Non-Parametric	1-of-2	Maximum Order Statistic

[1] Interwell data consists of the Appendix I and II parameters that have been detected in the combined background data set (MW-38 and MW-101B). Note that background data set adjustments were incorporated in accordance with Section 3.1.
[2] Bis(2-ethylhexyl)phthalate and tin were included only for assessment and corrective action monitoring locations.

Non-parametric prediction limits were used for antimony, arsenic, barium, bis(2-ethylhexyl)phthalate, cadmium, copper, nickel, tin, and zinc since either normality assumptions could not be met or there were less than 50% detects in the combined background data. A parametric lognormal prediction limit was used with cobalt since there were greater than 50% detects in the combined background data set, the assumptions of normality were met with a lognormal transformation, and the lognormal limit was accepted as being representative of the background distribution.

4.1.3 Prediction Limit Exceedances

A summary of the monitoring locations exhibiting a prediction limit exceedance during the August 2023 event is given in Table 6 for the upper bedrock system and Table 7 for the deeper bedrock system. Detailed prediction limit output for each analyte/well pair is included in Attachment 2.

Table 6

4.2 Double Quantification Rule

The DQR was used to evaluate SSIs over background for the remaining Appendix I and II constituents (i.e., constituents which have not been detected above the reporting limit in the combined background data set). The DQR output is included in Attachment 3, with a summary of the August 2023 DQR detections listed in Table 8 for the upper bedrock wells and in Table 9 for the deeper bedrock wells.

4.3 Summary of Comparison to Background

4.3.1 Detection Monitoring Locations

No wells in the upper bedrock system are in detection monitoring. For the deeper bedrock system, no prediction limit exceedances or DQR detections were identified at MW-31.

4.3.2 Delineation Monitoring Locations – Assessment Constituents

For the upper bedrock system, no prediction limit exceedances or DQR detections were identified at MW-105A and MW-106A. Prediction limit exceedances were identified at MW-107A, and MW-109A as listed in Table 6. As indicated in Table 8, no DQR detections were identified for the delineation monitoring wells in the upper bedrock system. In lieu of retesting for the prediction limit exceedances, SSIs were declared and evaluated for SSLs in Section 5.

For the deeper bedrock system, prediction limit exceedances were identified at MW-102B, MW-105B, MW-107B, MW-108B, and MW-109B as listed in Table 7. A prediction limit exceedance was not identified for arsenic at MW-104B. DQR detections were identified at MW-105B, MW-

107B, and MW-109B as listed on Table 9. In lieu of retesting for the prediction limit exceedances and DQR detections, SSIs were declared and evaluated for SSLs in Section 5.

4.3.3 Assessment Monitoring Locations

For the upper bedrock system, prediction limit exceedances were identified at AW-3, AW-4, AW-5, MW-21, MW-23, MW-26, MW-28, VP-3, and VP-4 as listed in Table 6. DQR detections were identified at AW-5, MW-21, and MW-23 as listed in Table 8. In lieu of retesting for the prediction limit exceedances and DQR detections, SSIs were declared and evaluated for SSLs in Section 5.

For the deeper bedrock system, no prediction limit exceedances or DQR detections were identified at MW-11 and MW-18. Prediction limit exceedances were identified at MW-15, MW-19, and MW-25 as listed in Table 7. DQR detections were identified at MW-25 as listed on Table 9. In lieu of retesting for the prediction limit exceedances and DQR detection, SSIs were declared and evaluated for SSLs in Section 5.

4.3.3.1 Exiting Assessment Monitoring

Table 10 presents a summary of the assessment monitoring locations and statistical comparisons required for exiting assessment monitoring. As discussed in Section 1, assessment monitoring locations will return to detection monitoring when Appendix II constituents fall below the current interwell prediction limit (for constituents which are detected in the background data set) and below the laboratory reporting limit (for constituents which are not detected in the background data set) for three consecutive sampling events. At MW-26, retriggered baseline assessment monitoring was initiated in January 2023. Evaluations to exit assessment monitoring were initiated with the current (Fall 2023) statistical evaluation since three samples have been collected in assessment monitoring. Note that MW-26 was the only upper and deeper bedrock assessment monitoring well that was sampled during the January and March 2023 sampling events.

Table 10
Evaluation to Exit Assessment Monitoring
All Appendix II Constituents Below Background

Monitoring Location	Aug. 2021	Aug. 2022	Jan. 2023	Mar. 2023	Aug. 2023
Upper Bedrock					
AW-3	No	No	N/A	N/A	No
AW-4	No	No	N/A	N/A	No
AW-5	No	No	N/A	N/A	No
MW-21	No	No	N/A	N/A	No
MW-23	No	No	N/A	N/A	No
MW-26	N/A	N/A	No	No	No
MW-28	No	No	N/A	N/A	No
VP-3	No	No	N/A	N/A	No
VP-4	No	No	N/A	N/A	No
Deeper Bedrock					
MW-11	No	No	N/A	N/A	**Yes**
MW-15	No	No	N/A	N/A	No
MW-18	No	No	N/A	N/A	**Yes**
MW-19	No	No	N/A	N/A	No
MW-25	No	No	N/A	N/A	No

N/A = not applicable; location was either not sampled or not included in the evaluation to exit assessment monitoring.

As shown in Table 10, the upper and deeper bedrock assessment monitoring locations have not had all Appendix II constituents below background values for three consecutive sampling events. Therefore, these locations will not exit assessment monitoring at this time.

4.3.4 Corrective Action Monitoring Locations – Assessment Constituents

For the upper bedrock system, prediction limit exceedances were identified at AW-1, AW-2, MW-12, MW-13, MW-17, MW-20, MW-24, MW-30, MW-32, MW-34, and MW-35 as listed on Table 6. DQR detections were identified at AW-1, AW-2, MW-12, MW-13, MW-16, MW-24, MW-30, MW-32, and MW-34 as listed on Table 8. In lieu of retesting for the prediction limit exceedances and DQR detections, SSIs were declared and evaluated for SSLs in Section 5.

For the deeper bedrock system, prediction limit exceedances and DQR detections were identified at AW-6, CRL-9, MW-14, MW-22, MW-33, and MW-36 as listed in Tables 7 and 9. In lieu of retesting for the prediction limit exceedances and DQR detections, SSIs were declared and evaluated for SSLs in Section 5.

5 Comparison to Groundwater Protection Standard

The prediction limit exceedances and DQR detections listed in Tables 6 through 9 were declared SSIs and evaluated for SSLs over the GWPS per 567 IAC 113.10(6)f and g. Comparisons to the GWPS were evaluated through statistical confidence intervals under the assessment monitoring null hypothesis. SSLs were declared to exist with statistical certainty when the lower confidence limit exceeds the GWPS. Statistical outputs for confidence intervals in assessment mode are included in Attachment 4.

In contrast, corrective action analyte/well pairs (i.e., those where SSLs have been previously declared) were evaluated to determine compliance with the GWPS per 567 IAC 113.10(9)e. A summary of the upper and deeper bedrock corrective action constituents was provided in Table 3. Comparisons to the GWPS in this case were evaluated through statistical confidence intervals under the corrective action monitoring null hypothesis, or in the case of downward trending data, confidence bands (upper 95% confidence limits) placed around the linear trend line. For corrective action constituents, compliance with the GWPS has been achieved with statistical certainty when the UCL or the upper 95% confidence limit on the trend line is lower than the GWPS for a period of three consecutive years or an alternate length of time established by the IDNR. Statistical outputs for regression statistics, confidence bands, and confidence intervals in corrective action mode are included in Attachment 5.

5.1 Compliance Data Set Review for Confidence Intervals

5.1.1 Adjustments Due to Changes in PQLs

Downgradient data set adjustments were approved to remove earlier non-detect data with elevated PQLs for upper bedrock cobalt data at AW-5, MW-13, MW-17, MW-23, and MW-35; to remove earlier non-detect and J-flagged data with elevated PQLs for deeper bedrock cobalt data at AW-6, CRL-9, MW-11, MW-14, MW-15, MW-22, MW-33 MW-36, MW-102B, MW-105B, and MW-107B; and to remove earlier non-detect and J-flagged data with elevated PQLs for the deeper bedrock nickel data at AW-6, CRL-9, MW-14, MW-15, MW-18, MW-19, MW-22, MW-33, and MW-36 due to the increased uncertainty the elevated PQLs added. IDNR approved the downgradient cobalt dataset adjustments due to elevated PQLs in the letters dated May 12, 2016 and November 20, 2017 (IDNR, 2016 and 2017). These data set adjustments were maintained in the current statistical evaluation.

5.1.2 Adjustments Due to Sampling Technique Changes

As noted in Section 3.1, the downgradient metals data sets continued to be reviewed on a case-by-case basis to determine whether data set adjustments are recommended based on the change in sampling technique from high-volume to low-flow sampling methods. In the letter dated November 20, 2017 (IDNR, 2017), IDNR concurred with the strategy to analyze wells on a case-by-case basis for a statistical correlation between newer and older sampling techniques.

No data set adjustments are currently recommended for the SSIs listed in Tables 6 through 9 and the corrective action constituents in Table 3. To date, downgradient data set adjustments include removal of the high-volume August 2008 through September 2014 zinc data at AW-7, MW-20, and MW-30 and removal of the high-volume August 2008 through September 2014 nickel data at MW-13. IDNR approved the zinc and nickel data set adjustments in the letter dated November 20, 2017 (IDNR, 2017). These data set adjustments were maintained in the current statistical evaluation.

5.1.3 Adjustments Due to Exiting Corrective Action

As further detailed in Attachment 1, the historical data prior to when statistical compliance with the GWPS was first achieved will be removed when analyte/well pairs exit corrective action and return to assessment constituents. Nickel in MW-12; cobalt, nickel, and vinyl chloride in MW-13; cobalt in MW-23; and arsenic in VP-3 exited corrective action and returned to assessment constituents during the Fall 2019 or Spring 2020 statistical evaluations. Cobalt in AW-5 and MW-17 exited corrective action and returned to assessment constituents during the Fall 2020 statistical evaluation. Compliance with the GWPS was first achieved in Spring 2015 for nickel in MW-12 and vinyl chloride in MW-13; in Fall 2016 for cobalt and nickel in MW-13 and cobalt in MW-23; in Spring 2017 for arsenic in VP-3; and in Fall 2017 for cobalt in AW-5 and MW-17. The historical data prior to these initial compliance dates have been removed. In addition, arsenic in MW-20 exited corrective action and returned to an assessment constituent during the current statistical evaluation (Fall 2023). Compliance with the GWPS was first achieved in Spring 2020 for arsenic in MW-20; therefore the historical data prior to Spring 2020 was removed during this statistical evaluation.

The following current and previous data set adjustments due to exiting corrective action were made for Site 1:

- Removal of the Sep. 2010 through March 2017 cobalt data in AW-5. Note that earlier non-detect cobalt data had already been removed as discussed in Section 5.1.1.
- Removal of the Aug. 2008 through Sep. 2014 nickel data in MW-12.
- Removal of the Sep. 2009 through Mar. 2016 cobalt data in MW-13.
- Removal of the Mar. 2015 through Mar. 2016 nickel data in MW-13. Note that nickel data prior to Mar. 2015 had already been removed as discussed in Section 5.1.2.
- Removal of the Aug. 2008 through Sep. 2014 vinyl chloride data in MW-13.
- Removal of the Sep. 2009 through March 2017 cobalt data in MW-17. Note that earlier non-detect cobalt data had already been removed as discussed in Section 5.1.1.
- Removal of the Aug. 2008 through Aug. 2019 arsenic data in MW-20.
- Removal of the Sep. 2010 through Mar. 2016 cobalt data in MW-23. Note that earlier non-detect cobalt data had already been removed as discussed in Section 5.1.1.
- Removal of the Aug. 2008 through Aug. 2016 arsenic data in VP-3.

5.2 Background as the Cobalt GWPS

Background cobalt concentrations in the upper bedrock data set exceeded the 567 IAC Chapter 137 Statewide Standard. Therefore, pursuant to 567 IAC 113.10(6)h, the GWPS for cobalt becomes background. The GWPS for cobalt in corrective action monitoring was evaluated with the statistical methods described in Attachment 1 and as recommended in the Unified Guidance (USEPA, 2009). Both the prediction limit (i.e., *two-sample*) and confidence interval (i.e., *one-sample*) methods were evaluated. Where concentration shifts were detected in the data, the *one-sample* confidence interval method was evaluated utilizing the linear trend line approach further detailed in Section 5.3 below. With background as the GWPS, the upper confidence limit is compared to the background upper tolerance limit with 95% confidence and 95% coverage (discussed in detail in Attachment 1).

Statistical outputs for the prediction limit and confidence interval methods with background as the GWPS for cobalt in upper bedrock wells MW-35, MW-105A, and MW-106A are included in Attachment 5. Note that the confidence interval method for cobalt in MW-35 and MW-105A was evaluated as 90% confidence bands placed around the linear trend line due to statistically significant decreasing trends identified at these locations, as further discussed in Section 5.3 below.

5.3 Data Concentration Shifts During Corrective Action

Statistically significant decreasing linear trends continued to be identified for arsenic in AW-1 (since 2008), in MW-12 (since 2008), in MW-24 (since 2012), in MW-30 (since 2014), in MW-34 (since 2011), and in MW-106A (since 2014); for cobalt in MW-35 (since 2012), in MW-105A (since 2013), and in MW-109B (since 2017); for thallium in AW-2 (since 2013) and MW-20 (since 2012); and for vinyl chloride in MW-34 (since 2008). In addition, a statistically significant decreasing linear trend was also identified for arsenic in MW-17 (since 2018) starting with the current statistical evaluation (Fall 2023). Consistent with previous memos, 90% confidence bands (upper 95% confidence limits) placed around the linear trend line were used since significantly decreasing linear trends were identified for these well/analyte pairs.

With this method for upper bedrock cobalt, the GWPS was calculated as the background upper tolerance limit with 95% confidence and 95% coverage. Regression statistics and confidence band outputs for these analyte/well pairs are provided in Attachment 5.

The upper 95% confidence limit remained below the GWPS for cobalt in MW-35. Conversely, the upper 95% confidence limits were above the GWPS for arsenic in AW-1, MW-12, MW-17, MW-24, MW-30, MW-34, and MW-106A, for cobalt in MW-105A and MW-109B, for thallium in AW-2 and MW-20, and for vinyl chloride in MW-34.

5.4 First Order Regression Calculations

Table 11 of the AWQR lists a projected year to completion for each analyte/well pair in corrective action (i.e., those listed in Table 3 of this memo). As initiated with the Fall 2019 statistical evaluation, remedy completion timeframes were estimated for the individual analyte/well pairs in corrective action for inclusion in Table 11 of the 2023 AWQR.

For the corrective action constituents that have achieved compliance with the GWPS (i.e., cobalt in MW-35), first order regression calculations were not utilized. The projected year to completion is three years after compliance with the GWPS was first statistically achieved and

will remain that date as long as concentrations remain statistically below the GWPS during the interim statistical evaluations.

For the remaining corrective constituents (i.e., those that have not achieved compliance with the GWPS), the projected year to completion was based on the first order regression calculations for each individual analyte/well pair. The projected years to completion are three years after the first order regression calculations projected initial compliance with the GWPS. For the corrective action constituents with decreasing trends, the first order regression calculations and projected year to completion are included on the regression statistics output in Attachment 5. The first order regression calculations for the remaining corrective action constituents are included on "Sample Values and Corresponding 1st-Order Regression Calculations for Date to Completion" table in Attachment 5.

5.5 SSL Summary

Confidence interval output for the upper and deeper bedrock assessment constituents is included in Attachment 4, and for the upper and deeper bedrock corrective action constituents is included in Attachment 5. The results for the upper bedrock are summarized in Table 11 and the results for the deeper bedrock are summarized in Table 11.

Table 11
Upper Bedrock SSL Summary
Aug. 2008 – Aug. 2023 Appendix II Data

Chemical Name	Wells with SSL (1)	SSL Not Identified or Rejected (1)	GWPS (2)

Cobalt (mg/L)	MW-105A (Confidence Interval Method Only), MW-106A (Both Methods)	MW-35 (Both Methods), MW-105A (Prediction Limit Method Only)	0.008 [3]
Thallium (mg/L)	AW-2, MW-20		0.002
Vinyl Chloride (ug/L)	MW-34		2

[1] Under the assessment null hypothesis, an SSL is indicated when the lower confidence limit exceeds the GWPS. Under corrective action null hypothesis, an SSL remains when the upper confidence limit exceeds the GWPS.
[2] Values are the 40 CFR Part 141 Safe Drinking Water Act MCL or the 567 IAC Chapter 137 Statewide Standard for a Protected Groundwater Source.
[3] GWPS for cobalt is background. The hypothesis was evaluated through the both the two-sample prediction limit method (GWPS = 0.008 mg/L) and the *one-sample* confidence limit method where the fixed GWPS was based on the background upper tolerance limit with 95% confidence and 95% coverage (GWPS = 0.008 mg/L).

Arsenic (mg/L)	CRL-9, MW-14, MW-22, MW-33, MW-36, MW-109B		0.01
Cobalt (mg/L)	AW-6, CRL-9, MW-22, MW-105B, MW-109B		0.0021
Thallium (mg/L)	MW-109B		0.002

[1] Under the assessment null hypothesis, an SSL is indicated when the lower confidence limit exceeds the GWPS. Under corrective action null hypothesis, an SSL remains when the upper confidence limit exceeds the GWPS.
[2] Values are the 40 CFR Part 141 Safe Drinking Water Act MCL or the 567 IAC Chapter 137 Statewide Standard for a Protected Groundwater Source.

5.6 Summary of Comparison to Groundwater Protection Standard

5.6.1 Delineation Monitoring Locations

No SSLs were identified for the assessment constituents in the upper bedrock delineation monitoring locations. Cobalt in MW-105A and arsenic and cobalt in MW-106A were evaluated as corrective action constituents. SSLs continued to be identified for these analyte/well pairs; therefore, compliance with the GWPS has not been achieved. Note that statistically significant decreasing trends were identified for cobalt in MW-105A and arsenic in MW-106A.

No SSLs were identified for the assessment constituents in the deeper bedrock delineation monitoring locations. Cobalt in MW-105B and arsenic, cobalt, and thallium in MW-109B were evaluated as corrective action constituents. SSLs continued to be identified for these analyte/well pairs; therefore, compliance with the GWPS has not been achieved. Note that a statistically significant decreasing trend was identified for cobalt in MW-109B.

5.6.2 Assessment Monitoring Locations

No SSLs were identified in the upper or deeper bedrock assessment monitoring locations.

5.6.3 Corrective Action Monitoring Locations

No SSLs were identified for the assessment constituents in the upper and deeper bedrock corrective action monitoring locations.

For the upper bedrock corrective action constituents listed in Table 3, SSLs over the GWPS remained for arsenic in AW-1, AW-2, MW-12, MW-13, MW-16, MW-17, MW-24, MW-30, MW-32, and MW-34; for thallium in AW-2 and MW-20; and for vinyl chloride in MW-34. While compliance with the GWPS was not achieved, statistically significant decreasing trends were identified for

arsenic in AW-1, MW-12, MW-17, MW-24, MW-30, and MW-34; thallium in AW-2 and MW-20; and vinyl chloride in MW-34.

Compliance with the GWPS was achieved for cobalt in MW-35 starting with the Fall 2022 statistical evaluation and remained during the current statistical evaluation. In accordance with 567 IAC 113.10(9)e(2), cobalt in MW-35 will return to an assessment constituent in 2025 as long as concentrations remain statistically below the GWPS during interim statistical evaluations.

For the deeper bedrock corrective action constituents listed in Table 3, SSLs continued to be identified for arsenic in CRL-9, MW-14, MW-22, MW-33, and MW-36; and for cobalt in AW-6, CRL-9, and MW-22.

6 Effective Power and Site-Wide False Positive Rate

Statistical power calculations, effective power curves for the 1-of-2 prediction limit plan, and the current site-wide false positive rate (SWFPR) are discussed in detail in Attachment 6. Based on the power curves, the parametric and non-parametric prediction limits have good power. The current cumulative annual SWFPR for the plan is approximately 28%. The current annual SWFPR is higher than the Unified Guidance target 10% false positive rate due to moving from a 1-of-3 to the 1-of-2 prediction plan starting with the Spring 2021 statistical evaluation and the relatively large number of downgradient comparisons with non-parametric prediction limits. Given the number of non-parametric prediction limit evaluations, a background sample size of approximately 80-90 is needed to reduce the SWFPR once again to the 10% target level.

Statistical power calculations for confidence limits compared to the GWPS under assessment monitoring (or assessment mode under corrective action) are included in the confidence interval output of Attachment 4. Details regarding the purpose and procedures for these calculations are provided in Attachment 1. Confidence limits are calculated to meet statistical power levels of 50% for increases in the true concentration mean of 1.5 times a fixed standard, and 80% for increases in the true concentration mean of 2.0 times a fixed standard, as discussed in Unified Guidance Chapter 22 (USEPA, 2009).

7 Conclusions

The methodology described in Attachment 1 was utilized to conduct the statistical evaluations for the upper and deeper bedrock locations in the delineation and corrective action monitoring programs.

In August 2023, semiannual corrective action, background, and delineation monitoring was conducted at upper bedrock wells MW-12, MW-13, MW-16, MW-17, MW-32, MW-37, and MW-101A and deeper bedrock wells MW-14, MW-33, MW-38, MW-101B, and MW-109B. In accordance with Permit Amendment #16, annual detection, assessment, corrective action, and delineation monitoring was also conducted in August 2023 at upper bedrock wells AW-1, AW-2, AW-3, AW-4, AW-5, MW-20, MW-21, MW-23, MW-24, MW-26, MW-28, MW-30, MW-34, MW-35, VP-3, VP-4, MW-105A, MW-106A, MW-107A, and MW-109A and deeper bedrock wells AW-6, CRL-9, MW-11, MW-15, MW-18, MW-19, MW-22, MW-25, MW-31, MW-36, MW-102B, MW-104B, MW-105B, MW-107B, and MW-108B.

7.1 Upper Bedrock Monitoring Locations

A summary of the Fall 2023 statistical evaluation results for the upper bedrock system is presented in Table 13.

Table 13
Summary of the Fall 2023 Evaluation - Upper Bedrock

Monitoring Location	Monitoring Program	Current Schedule [1] (Aug. 2023)	Current SSIs	Corrective Action Constituents		Retesting Parameter	Monitoring Program Changes
				Current SSLs [2]	Achieved Compliance with GWPS		
Downgradient Monitoring Locations

MW-109A	Delineation	Appendix I	Barium				

[1] Appendix II locations were sampled for the Appendix I and detected Appendix II constituents in Aug. 2023.

[2] Analyte/well pairs with SSLs over the GWPS identified during previous statistical evaluations and have not achieved compliance with the GWPS for 3 consecutive years in accordance with 567 IAC 113.10(9)e(2).

7.1.1 Delineation Monitoring

In August 2023, annual delineation monitoring for the Appendix I list was conducted at MW-105A, MW-106A, MW-107A, and MW-109A. The SSIs identified for the assessment constituents in the upper bedrock delineation monitoring locations are summarized in Table 13. No SSLs were identified for the assessment constituents in the upper bedrock delineation monitoring locations.

Cobalt in MW-105A and arsenic and cobalt in MW-106A were evaluated as corrective action constituents due to previously identified SSLs for these analyte/well pairs. The GWPS for cobalt was taken as background since background cobalt concentrations exceeded the 567 IAC Chapter 137 Statewide Standard for a Protected Groundwater Source. Both the *two-sample* prediction limit and the *one-sample* confidence interval or confidence band on the linear trend line testing methods were utilized to compare cobalt in MW-105A and MW-106A to the background GWPS. SSLs continued to be identified for cobalt in MW-105A and arsenic and cobalt in MW-106A; therefore, compliance with the GWPS has not been achieved. Note statistically significant decreasing trends were identified for cobalt in MW-105A and arsenic in MW-106A.

Annual delineation monitoring for the Appendix I list will be conducted at MW-105A, MW-106A, MW-107A, and MW-109A in Fall 2024.

7.1.2 Assessment Monitoring

In August 2023, annual assessment monitoring for Appendix I and detected Appendix II constituents was conducted at AW-3, AW-4, AW-5, MW-21, MW-23, MW-26, MW-28, VP-3, and VP-4.

The SSIs identified at the upper bedrock assessment monitoring locations are summarized in Table 13. No SSLs were identified for the upper bedrock assessment monitoring locations.

The Fall 2023 statistical evaluation did not identify upper bedrock assessment monitoring locations with all Appendix II constituents below the interwell prediction limit or laboratory reporting limit for three consecutive sampling events. As a result, none of the upper bedrock locations may exit assessment monitoring at this time.

Annual assessment monitoring for Appendix I and detected Appendix II constituents will be conducted at AW-3, AW-4, AW-5, MW-21, MW-23, MW-26, MW-28, VP-3, and VP-4 in Fall 2024. In accordance with Permit Amendment #6, the next five-year resampling for the full Appendix II list will be conducted at AW-3, AW-4, AW-5, MW-21, MW-23, MW-28, VP-3, and VP-4 in Fall 2025 and at MW-26 in Fall 2028.

7.1.3 Corrective Action Monitoring

In August 2023, semiannual corrective action monitoring was conducted at MW-12, MW-13, MW-16, MW-17, and MW-32 and annual corrective action monitoring was conducted at AW-1, AW-2, MW-20, MW-24, MW-30, MW34, and MW-35 for the Appendix I and detected Appendix II constituents. In accordance with 567 IAC 113.10(9)e(2), arsenic in MW-20 returned to an assessment constituent in Fall 2023 since concentrations were statistically below the GWPS for three consecutive years during the Fall 2022 statistical evaluation.

The SSIs identified for the assessment constituents in the upper bedrock corrective action monitoring locations are summarized in Table 13. No SSLs were identified for the assessment constituents in the upper bedrock corrective action monitoring locations.

For the upper bedrock corrective action constituents listed in Table 3, SSLs over the GWPS remained for arsenic in AW-1, AW-2, MW-12, MW-13, MW-16, MW-17, MW-24, MW-30, MW-32, and MW-34; for thallium in AW-2 and MW-20; and for vinyl chloride in MW-34. While compliance with the GWPS was not achieved, statistically significant decreasing trends were identified for arsenic in AW-1, MW-12, MW-17, MW-24, MW-30, and MW-34; thallium in AW-2 and MW-20; and vinyl chloride in MW-34.

Compliance with the GWPS was achieved for cobalt in MW-35 starting with the Fall 2022 statistical evaluation and remained during the current statistical evaluation. In accordance with 567 IAC 113.10(9)e(2), cobalt in MW-35 will return to an assessment constituent in 2025 as long as concentrations remain statistically below the GWPS during interim statistical evaluations.

Semiannual corrective action monitoring for the Appendix I and detected Appendix II constituents will be conducted at MW-12, MW-13, MW-16, MW-17, and MW-32 in Spring and Fall 2024. Annual corrective action monitoring for the Appendix I and detected Appendix II constituents will be conducted at AW-1, AW-2, MW-20, MW-24, MW-30, MW-34, and MW-35 in Fall 2024. In accordance with Permit Amendment #6, the next five-year resampling for the full Appendix II list will be conducted at the corrective action monitoring locations in Fall 2025.

7.1.4 Background Monitoring

Semiannual background monitoring for the Appendix I and detected Appendix II constituents was conducted at MW-37 and MW-101A in August 2023. Semiannual background monitoring for the Appendix I and detected Appendix II constituents will be continued at MW-37 and MW-101A in Spring and Fall 2024.

7.2 Deeper Bedrock Monitoring Locations

A summary of the Fall 2023 statistical evaluation results for the deeper bedrock system is presented in Table 14.

Table 14
Summary of the Fall 2023 Evaluation - Deeper Bedrock

Monitoring Location	Monitoring Program	Current Schedule [1] (Aug. 2023)	Current SSIs	Corrective Action Constituents		Retesting Parameter	Monitoring Program Changes
				Current SSLs [2]	Achieved Compliance with GWPS		
Downgradient Monitoring Locations							
AW-6	Corrective Action	Appendix II	1,1-Dichloroethane; Barium; Nickel	Cobalt			
CRL-9	Corrective Action	Appendix II	Barium; Benzene; Nickel	Arsenic; Cobalt			
MW-11	Assessment	Appendix II					
MW-14	Corrective Action	Appendix II	1,1-Dichloroethane; 1,4-Dichlorobenzene; Barium; Benzene; Chlorobenzene; Nickel	Arsenic			
MW-15	Assessment	Appendix II	Cobalt; Nickel				
MW-18	Assessment	Appendix II					
MW-19	Assessment	Appendix II	Nickel				
MW-22	Corrective Action	Appendix II	1,1-Dichloroethane; Barium; Nickel; Thallium	Arsenic; Cobalt			
MW-25	Assessment	Appendix II	Barium; Lead; Thallium				
MW-31	Detection	Appendix I					
MW-33	Corrective Action	Appendix II	1,4-Dichlorobenzene ; Barium; Benzene; Chlorobenzene; Cobalt; Nickel	Arsenic			
MW-36	Corrective Action	Appendix II	1,4-Dichlorobenzene; Barium; Chlorobenzene; Cobalt	Arsenic			
Background Monitoring Locations							
MW-38	Background	Appendix II					
MW-101B	Background	Appendix II					
Delineation Monitoring Locations							
MW-102B	Delineation	Appendix I	Cobalt				
MW-104B	Delineation	Arsenic, TSS					
MW-105B	Delineation	Appendix I	1,1-Dichloroethane; Barium; Nickel	Cobalt			
MW-107B	Delineation	Appendix I	Barium; Cobalt; Nickel; Thallium				
MW-108B	Delineation	Appendix I without Cobalt [3]	Barium				
MW-109B	Delineation	Appendix I	Barium; Chlorobenzene; Nickel	Arsenic; Cobalt; Thallium			

[1] Appendix II locations were sampled for the Appendix I and detected Appendix II constituents in Aug. 2023.

[2] Analyte/well pairs with SSLs over the GWPS identified during previous statistical evaluations and have not achieved compliance with the GWPS for 3 consecutive years in accordance with 567 IAC 113.10(9)e(2).

7.2.1 Detection Monitoring

Annual detection monitoring for the Appendix I constituents was conducted at MW-31 in August 2023. No SSIs were identified at MW-31. The next annual detection monitoring for the Appendix I list will be conducted at MW-31 in Fall 2024.

7.2.2 Delineation Monitoring

In August 2023, semiannual delineation monitoring was conducted at MW-109B for the Appendix I constituents. In addition, annual delineation monitoring was conducted at MW-102B, MW-105B, and MW-107B for the Appendix I list, at MW-104B for arsenic, and at MW-108B for the Appendix I list without cobalt.

The SSIs identified for the assessment constituents in the deeper bedrock delineation monitoring locations are summarized in Table 14. No SSLs were identified for the assessment constituents in the deeper bedrock delineation monitoring locations.

Confidence intervals in corrective action mode were utilized to evaluate cobalt in MW-105B and arsenic, cobalt, and thallium in MW-109B (i.e., the corrective action constituents). SSLs continued to be identified for these analyte/well pairs; therefore, compliance with the GWPS has not been achieved. While compliance with the GWPS was not achieved, a statistically significant decreasing trend was identified for cobalt in MW-109B.

Semiannual delineation monitoring for the Appendix I constituents will be conducted at MW-109B in Spring and Fall 2024. In Fall 2024, annual delineation monitoring will be conducted at MW-102B, MW-105B, and MW-107B for the Appendix I list, at MW-104B for arsenic, and at MW-108B for the Appendix I list without cobalt.

7.2.3 Assessment Monitoring

In August 2023, annual assessment monitoring for Appendix I and detected Appendix II constituents was conducted at MW-11, MW-15, MW-18, MW-19, and MW-25.

The SSIs identified at the deeper bedrock assessment monitoring locations are summarized in Table 14. No SSLs were identified in the deeper bedrock assessment monitoring locations.

The Fall 2023 statistical evaluation did not identify deeper bedrock assessment monitoring locations with all Appendix II constituents below the interwell prediction limit or laboratory reporting limit for three consecutive sampling events. As a result, none of the deeper bedrock locations may exit assessment monitoring at this time.

Annual assessment monitoring for the Appendix I and detected Appendix II constituents will be conducted at MW-11, MW-15, MW-18, MW-19, and MW-25 in Fall 2024. In accordance with Permit Amendment #6, the next five-year resampling for the full Appendix II list will be conducted at the assessment monitoring locations in Fall 2025.

7.2.4 Corrective Action Monitoring

In August 2023, semiannual corrective action monitoring was conducted at MW-14 and MW-33, and annual corrective action monitoring was conducted at AW-6, CRL-9, MW-22, and MW-36 for the Appendix I and detected Appendix II constituents.

The SSIs identified for the assessment constituents in the deeper bedrock corrective action monitoring locations are summarized in Table 14. No SSLs were identified for the assessment constituents in the deeper bedrock corrective action monitoring locations.

For the deeper bedrock corrective action constituents listed in Table 3, SSLs continued to be identified for arsenic in CRL-9, MW-14, MW-22, MW-33, and MW-36; and for cobalt in AW-6, CRL-9, and MW-22.

Semiannual corrective action monitoring for the Appendix I and detected Appendix II constituents will be conducted at MW-14 and MW-33 in Spring and Fall 2024. Annual corrective action monitoring for the Appendix I and detected Appendix II constituents will be conducted at AW-6, CRL-9, MW-22, and MW-36 in Fall 2024. In accordance with Permit Amendment #6, the next five-year resampling for the full Appendix II list will be conducted at the corrective action monitoring locations in Fall 2025.

7.2.5 Background Monitoring

Semiannual background monitoring for the Appendix I and detected Appendix II constituents was conducted at MW-38 and MW-101B in August 2023. Semiannual background monitoring for the Appendix I and detected Appendix II constituents will be continued at MW-38 and MW-101B in Spring and Fall 2024.

Attachment 1
Detailed Discussion of Statistical Methods

Foth

Memorandum

Statistical Methodology

1. Comparison to Background

For determining which parameters will need a formal statistical treatment, the Unified Guidance (USEPA, 2009) suggests splitting monitoring parameters into three distinct groups: a) reliable indicators selected for formal testing; b) other analytes which are monitored for general groundwater quality information but not statistically tested; and c) those meeting the "never-detected" criteria. Only those parameters with some historically detected presence in background need to be included in the first group and treated with a formal statistical test. Any parameter that has never been detected in background is eligible for the third group of "never-detected" constituents. Constituents with detections below the reporting limit (J-flagged data) will be considered "never-detected." As a means of evaluating the third group, the Unified Guidance suggests the Double Quantification Rule (DQR). The DQR is stated in the Unified Guidance as:

"A confirmed exceedance is registered if any well-constituent pair in the '100% non-detect' group exhibits quantified measurements [i.e., at or above the reporting limit (RL)] in two consecutive sample and resample events."

The Unified Guidance also recommends establishing background sample sizes as large as feasible. The guidance recognizes that small sample sizes in background can be "particularly" troublesome, especially in controlling statistical test false positive and negative rates. With parametric tests (such as parametric prediction limits), the false positive rate may be controlled, but at the expense of statistical power. With non-parametric tests (such as non-parametric prediction limits or the "quasi-statistical" DQR), the false positive rate may be unacceptably high. The Unified Guidance suggests that generally at least 8 to 10 separate background measurements be available, recognizing that statistical power continues to increase with larger sample sizes.

In reports prior to the *2011 Annual Water Quality Report* (Foth, 2012), the ANOVA and a "2x2 contingency table" methods were used to evaluate statistically significant increases (SSIs) over background. These methods met the criteria of 567 Iowa Administrative Code (IAC) 113.10(4)g and h. The ANOVA and "2x2 contingency table" methods were used to maximize the statistical power while minimizing potentially large false positive rates as a result of the smaller sample sizes.

Starting with the *2011 Annual Water Quality Report* (Foth, 2012), the statistical analysis methods utilized for comparison to background were the DQR and "1-of-3" interwell prediction limits as recommended in the Unified Guidance (USEPA, 2009). Note that a "1-of-2" retesting plan was not selected as it would have resulted in a 'low' effective statistical power level for the site based on USEPA reference power curves as defined in the Unified Guidance.

Starting with the Spring 2021 statistical evaluation, the interwell prediction limit retesting plan was modified to a "1-of-2" plan. With increases in the number of background samples, a "1-of-2" plan was able to achieve a 'good' effective statistical power level for the site based on the USEPA reference power curves.

Expansion of the Background Data Set

The background data set was modified in 2013 to add MW-101A and MW-101B to the upper bedrock and deeper bedrock background data sets, respectively. The statistical analysis methods continued the DQR and "1-of-2" interwell prediction limits as recommended in the Unified Guidance (USEPA, 2009), utilizing the pooled data from MW-37 and MW-101A for the upper bedrock system and MW-38 and MW-101B for the deeper bedrock system.

Double Quantification Rule

The DQR will be used to evaluate SSIs over background for the Appendix I and II constituents that were not detected above the reporting limit in the background data sets. An SSI will be indicated for any well-constituent pair with quantified measurements at or above the reporting limit noted for two consecutive sample and resample events. If applicable, the resample will be collected prior to next semiannual sampling event.

Interwell Prediction Limits

Interwell prediction limits will be used to statistically evaluate SSIs over background for the Appendix I and II constituents which have been detected above the reporting limit in the background data set. A "1-of-2" retesting plan will be utilized on individual sample results. The 1-of-2 retesting plan as defined in the Unified Guidance concludes that an SSI has occurred when two out of two sample results exceed the prediction limit, while no SSI is concluded if 1-of-2 are below the limit. If applicable, the resample will be collected prior to next semiannual sampling event. The prediction limit for each constituent will be recalculated semiannually.

For interwell constituents with less than or equal to 50% detects in the background data set, a non-parametric prediction limit will be utilized. The non-parametric prediction limit will be taken as the maximum order statistic (maximum value) of the background data.

For interwell constituents with greater than 50% detects in the background data set, normality assumptions will be verified using the Shapiro-Wilk normality test. If the background data is not normally distributed, a non-parametric prediction limit will be utilized (as described in the paragraph above). If the background data is normally distributed or can be fit to a normal distribution utilizing a normalizing transformation, then a normal-based parametric prediction limit will be applied.

When considering a lognormal prediction limit, a comparison will be made to the maximum order statistic for the background data set. Lognormal prediction limits can be sensitive to smaller departures from lognormality. That is, if data are not truly lognormal, but also not rejected as lognormal, the prediction limit may be inflated because of the transformation. In choosing a lognormal limit, in addition to the percent detections and lognormal goodness of fit criteria, an additional convention will be applied. If the lognormal limit exceeds the level of twice the maximum background concentration, it is assumed that the lognormal model does not adequately fit the background distribution and a non-parametric prediction limit will be selected.

For interwell constituents with 50% to 85% detects in the background data set, Kaplan-Meier estimation will be applied to manage statistical bias introduced by non-detects. For interwell constituents with over 85% detects in the background data set, half the reporting limit will be used for non-detect data. These estimation methods follow Unified Guidance recommendations and are given in detail in Unified Guidance Chapter 15 (USEPA, 2009).

The parametric prediction limit will be calculated as:

$$PL = \bar{x} + k \cdot s$$

where $\bar{x}$ is the sample mean of the August 2008 through current event background data, *s* is the sample standard deviation, and *k* is the multiplier obtained from the Unified Guidance Table 19-1 (USEPA, 2009) for 1-of-2 interwell prediction limits on observations. In determining *k*, the number of constituents of concern (COCs) for formal statistical evaluation along with the number of downgradient wells need to be identified. Per the basic subdivision discussion presented in Section 19.2.1 of the Unified Guidance, along with the discussion regarding the use of the appendix tables for parametric retesting plans given on pages 19-13 through 19-15 of the Unified Guidance (USEPA, 2009), the *k*-multiplier is chosen based on the number of constituents, wells, and evaluations performed annually. When an exact well and COC configuration is not given in the appendix tables, the *k*-multiplier is linearly interpolated as described on page 19-14 of the Unified Guidance (USEPA, 2009).

Sanitas® v10.0. software (Sanitas Technologies) will be used to check distributional assumptions, perform Kaplan-Meier in the case of 50% to 85% detects in the background data set, and calculate the *k*-multipliers and subsequent prediction limits.

Intrawell Prediction Limits

Intrawell prediction limits are calculated in a similar manner to that described above for the interwell case. A main difference between the two methods is the intrawell limit is calculated from a collection of background measurements within the compliance well. A minimum of eight compliance well background samples will be used when calculating the limit.

A second difference is for the parametric prediction limit, in which the *k*-multiplier is modified from the interwell case, as given in Appendix D Tables 19-10 through 19-18 of the Unified Guidance (USEPA, 2009).

Updating intrawell background is performed periodically. The Unified Guidance (Section 5.3.2) recommends that 4 to 8 new compliance observations be collected prior to updating the background dataset. The guidance also states that "a potential update is predicated on there being no statistically significant increase [SSI] recorded for that well constituent, including since the last update." A two-sample t-test or Wilcoxon rank-sum test between existing intrawell background data and the potential set of newer background data is performed, and a non-significant result (α = 0.05) implies that the newer compliance data can be re-classified as background measurements.

For Wilcoxon rank-sum tests, non-detect results cannot be ranked with certainty and the problem is compounded with multiple PQLs and/or J-flagged values (USEPA, 2009). In comparisons where a substantial fraction of non-detect and/or J-flagged measurements or changing PQLs occur, professional judgment will be utilized for evaluating significant differences between the existing intrawell background data and the potential newer set of background data. Consideration will be given to whether significant differences are due to artificial variation introduced by censored data.

2. Comparison to Groundwater Protection Standard – Assessment Monitoring

According to 567 IAC 113.10(6)f and g, under the assessment monitoring program Appendix II results which have been determined to be statistically above background are also statistically compared to the GWPS. If "Appendix II constituents are detected at statistically significant levels above the GWPS" a notice is placed in the operating record and characterization is begun.

Under 567 IAC 113.10(6)h, the GWPS is the maximum contaminant level (MCL) promulgated under Section 1412 of the Safe Drinking Water Act in 40 Code of Federal Regulations (CFR) Part 141. If no MCL exists, or if background concentrations are higher than the MCL, the GWPS is defined as background. Also, per 567 IAC 113.10(6)i, an alternative GWPS may be established by the department for constituents for which there is no MCL such as the "health-based concentrations that comply with the statewide standards for groundwater established pursuant to 567 IAC Chapter 137."

When the GWPS is background concentrations, the statistical methods discussed in the above "1. Comparison to Background" are used. When the GWPS is the MCL or an alternative health-based concentration, per the Unified Guidance (USEPA, 2009), "confidence intervals are the recommended general statistical strategy in compliance/assessment or corrective action monitoring." In the case of normally distributed data, a normal-based parametric confidence interval is used. If the data are not normally distributed a non-parametric confidence interval on the median is used. A lower 99% confidence limit falling above the GWPS implies that concentrations are detected at statistically significant levels above the GWPS with an α-level of 0.01, which is the minimum RCRA regulatory limit from §264.97(i)(2) for an individual test false positive error rate.

The Unified Guidance recognizes that statistical power is also of prime concern to USEPA and that there "should be a high probability that the statistical test will positively identify concentrations that have exceeded a fixed regulatory standard." In compliance/assessment monitoring, instead of pre-specifying the false positive rate prior to computing confidence interval limits, the Unified Guidance suggests the desired level of power (1-β) should be set as an initial target.

For compliance/assessment monitoring purposes, the Unified Guidance (Chapter 22) suggests evaluating increases in the true concentration mean of 1.5 and 2.0 times a fixed standard. (This is similar in concept to the critical power targets in detection monitoring, i.e., 55-60% power at 3σ above background and 80-85% power at 4σ over background). As a general guide, the Unified Guidance suggests there should be at least 70-80% statistical power for detecting increases of 2 times a fixed standard. Specifically, the Unified Guidance recommends there be 50% power of detecting increases in the true concentration mean of 1.5 times a fixed standard (risk ratio of 1.5) and 80% power of detecting increases in the true concentration mean of 2.0 times a fixed standard (risk ratio of 2.0).

To meet these levels of statistical power, α is chosen based on either Unified Guidance Equation 22.1:

$$1 - \beta = G_{T,n-1}\left(t_{1-\alpha,n-1}\middle|\Delta - \sqrt{n}(R-1)\right);$$

where R is the desired risk ratio, $t_{(1-\alpha,n-1)}$ is the (1−α) Student's t-quantile with (n−1) degrees of freedom and G represents the cumulative non-central t-distribution with (n−1) degrees of freedom and noncentrality parameter Δ;

or Unified Guidance Equation 22.2:

$$\alpha \sim 1 - F_{T,n-1}\left(\frac{(R-1)\sqrt{n}}{R \cdot \widehat{CV}} - t_{1-\beta,n-1}\right);$$

where R is the desired risk ratio, n is the sample size, CV is the estimated sample coefficient of variation, $t_{(1-\beta,n-1)}$ is the (1−β) Student's t-quantile with (n−1) degrees of freedom, and F is the cumulative (central) Student's t-distribution function.

The first equation (Unified Guidance Equation 22.1) assumes a coefficient of variation (CV) =1. This version is used if only poorer estimates of the true CV are available. In practice, a convention has been adopted with the statistical updates to utilize Unified Guidance Equation 22.2 in all cases where a parametric confidence interval is calculated and use Unified Guidance Equation 22.1 when non-parametric confidence intervals are calculated. Since a non-parametric confidence interval is based on the median, it is not as sensitive to departures from normality, and the assumption of a CV=1 in Unified Guidance Equation 22.1 should provide a conservative estimate.

Since 0.01 is the minimum RCRA regulatory limit for α, it is never set lower than this. Conversely, the Unified Guidance recognizes the "difficulty of simultaneously attaining the recommended level of power while controlling the false positive rate, especially for small sample sizes and highly variable data." The Unified Guidance suggests a maximum false positive rate of α=0.2 is a reasonable upper bound.

Finally, like the need for defining a SWFPR under detection monitoring, the Unified Guidance (Chapter 7) recognizes there may be concern about the "use of relatively high individual test-wise false positive rates (α) in order to meet a pre-specified power, especially when considering the cumulative false positive error rate across multiple wells and/or constituents." However, "the Unified Guidance considers computation of cumulative SWFPRs in compliance/assessment testing to be problematic, and reliance on individual test false positive rates preferable." Notwithstanding, if several confidence limit calculations are compared to the GWPS with high α-levels, caution should be taken in the interpretation.

For calculation of confidence intervals, Sanitas® v10.0 software is again used to check distributional assumptions, perform Kaplan-Meier estimation in the case of 50% to 85% detects, and calculate either parametric or nonparametric confidence limits.

3. Comparison to Groundwater Protection Standard – Corrective Action Monitoring

As stated above, if "Appendix II constituents are detected at statistically significant levels above the GWPS" a notice is placed in the operating record and characterization is begun. Owners or operators are required to initiate an assessment of corrective measures, select a remedy, and implement a remedy in accordance with 567 IAC 113.10(7), (8), and (9). For remedy completion in accordance with 567 IAC 113.10(9)e(2), compliance with the GWPS is considered achieved by demonstrating that concentrations of Appendix II constituents have not exceeded the GWPS

for a period of three consecutive years or an alternate length of time established by the Department.

Starting with the Fall 2019 statistical evaluation, individual analyte/well pairs may return to assessment constituents (at the corrective action monitoring location) once compliance with the GWPS has been achieved for a period of 3 years. Note that monitoring wells will not move out of the corrective action monitoring program until all Appendix II constituents have achieved compliance with the GWPS for a period of three consecutive years.

Confidence Intervals in Corrective Action Mode

In the case of the GWPS being a fixed standard as either the 40 CFR Part 141 Safe Drinking Water Act MCL or the 567 IAC Chapter 137 Statewide Standard for a Protected Groundwater Source, "confidence intervals are the recommended general statistical strategy in compliance/assessment or corrective action monitoring" (USEPA, 2009). However, a primary difference between confidence intervals as used under assessment monitoring and confidence intervals used under corrective action is reversal of the null hypothesis. As detailed in Section 7.2 of the Unified Guidance (USEPA, 2009), the hypothesis testing structure under assessment monitoring is to presume compliance point concentrations do not to exceed the fixed standard unless sampling data indicates otherwise. As a formal statistical hypothesis, this is written as:

$$H_0: \Theta \leq G \quad \text{vs.} \quad H_A: \Theta > G$$

In corrective action mode, the hypothesis is reversed. Namely, compliance point concentrations are presumed to exceed the fixed standard and evidence must be presented to demonstrate regulatory compliance. In the case of corrective action, the statistical hypothesis is written as:

$$H_0: \Theta > G \quad \text{vs.} \quad H_A: \Theta \leq G$$

For testing under assessment monitoring, a lower confidence limit (LCL) is compared to the compliance standard *G*. If the LCL is larger than the standard *G*, it is concluded that the compliance standard has been violated.

However, under corrective action monitoring, the upper confidence limit (UCL) is compared to the compliance standard G. In this case, the UCL should lie below the standard to accept the alternative hypothesis that concentration levels are in compliance.

The UCL α-level under corrective action monitoring is set so that a high degree of confidence is achieved in declaring successful remediation. Per the Unified Guidance (Section 7.4.2) "USEPA's overriding concern in corrective action is that remediation efforts are not declared successful without sufficient statistical proof." The Unified Guidance "recommends the use of a reasonably low, fixed test-wide false positive rate (e.g., α = 0.05 or 0.10)." In this case, α = 0.10 corresponds to a 90% UCL.

GWPS as Background

Pursuant to 567 IAC 113.10(6)h, when background concentrations of an analyte exceed the applicable MCL or 567 IAC Statewide Standard for a Protected Groundwater Source, the GWPS is the background concentration. In this case, the GWPS is not a fixed standard but based on a distribution of background sample results.

Section 7.5 of the Unified Guidance (USEPA, 2009) details statistical hypothesis testing under corrective action when the GWPS is background. The Unified Guidance offers two alternative statistical approaches to hypothesis testing in this case. These alternatives are as follows:

A. The first represents a *two-sample* test of two distinct populations, namely the compliance well to background populations. Similar to the statistical tests used under detection and assessment monitoring, with this alternative under corrective action, the Unified Guidance states that "one highly recommended statistical test approach is a prediction limit." The Unified Guidance also states, "whatever the critical value for a selected background test, it becomes the GWPS under compliance/assessment or corrective action monitoring." Further, "the only allowable hypothesis test structure for the two-sample approach follows that of detection and compliance monitoring. Once exceeded and in corrective action, a return to compliance is through evidence that future samples lie below the GWPS using the same hypothesis structure." Therefore, with this approach in corrective action, prediction limits are calculated similarly as in assessment monitoring. Compliance well concentrations below a prediction limit indicate a return to concentrations below the background GWPS.

B. The second involves computation of a fixed statistic from the background data as the GWPS. The Unified Guidance recommendation in this case is to define a fixed GWPS based on a background upper tolerance limit with 95% confidence and 95% coverage. This is designed to be a "reasonable maximum on the likely range of background concentrations." This upper tolerance limit based on background data is then used as a fixed standard in statistical comparisons with 90% or 95% UCLs from compliance wells as discussed previously. Also, with the UCL method, the null hypothesis is reversed from that of assessment monitoring, assuming contamination is above the GWPS. A UCL falling below the background GWPS offers evidence of a return to concentrations below the GWPS. The Unified Guidance refers to this approach as a *single-sample* testing method, since the compliance well population is tested against a defined fixed standard.

The Unified Guidance discusses tradeoffs between the two approaches and does not necessarily prescribe either approach over the other. The Unified Guidance suggests that both approaches may be used, where "the background GWPS would be a range based on the two testing methods rather than a single value."

Normality

For calculation of confidence intervals, Sanitas® v10.0 software is again used to check distributional assumptions, perform Kaplan-Meier estimation in the case of 50% to 85% detects, and calculate either parametric or nonparametric confidence limits. "Corrective Action Mode" is selected for this analysis.

Non-Corrective Action Constituents

As recommended in the Unified Guidance (USEPA, 2009), confidence intervals in corrective action mode will be utilized to evaluate only constituents and monitoring locations with previously identified SSLs over the GWPS. Other compliance constituents (i.e., those without SSLs over the GWPS during prior statistical evaluations) will continue to be evaluated using the "1. Comparison to Background" and "2. Comparison to Groundwater Protection Standard – Assessment Monitoring" methods described above.

Note: The Unified Guidance (USEPA, 2009) states: "it should be recognized that once corrective action or remediation activities are initiated, there will be a considerable time during which the GWPS may still be exceeded. As provided in the RCRA regulations, it is at the conclusion of remediation activities that formal corrective action monitoring evaluation is appropriate. However, in the intervening period of remedial activity, well constituents can still be monitored, and the relative efficacy of remediation measures tracked. The same corrective action hypothesis can be assumed for the targeted constituents; techniques such as trend testing may be appropriate interim applications." Given the statement above and the intentions of 567 IAC 113.10(6)g, as soon as an SSL is identified for an assessment monitoring constituent/location, then the next statistical evaluation will utilize corrective action monitoring (confidence intervals in corrective action mode).

Data Concentration Shifts During Corrective Action

Confidence intervals assume that the population is stable over time. As a result, confidence intervals may not accurately represent the current well concentrations if increasing or decreasing trends are observed (i.e., during a release or under active remediation). Per the Unified Guidance (USEPA, 2009), lower or upper confidence limits constructed on accumulated data may be overly wide (due to high sample variability caused by combining pre- and post-shift data) and may not be reflective of more recent upward/downward shifts in the contaminant distribution.

Alternative procedures may be applied to data sets with shifting distributions. For example, where trends tests are significant, pre-shift data may be removed from the well/parameter data set for the purposes of constructing the confidence interval. "The reduction in sample size will often be more than offset by the gain in statistical power. More recent measurements may exhibit less variation around the shifted mean value, resulting in a shorter confidence interval" (USEPA, 2009).

Another alternative is to construct confidence bands around the trend line to track progress towards exceeding or meeting a fixed standard. As suggested in the Unified Guidance (Chapter 22), if a trend is present, a 90% confidence band (upper 95% confidence limit) is placed on the linear trend line. If the upper 95% confidence limit on the trend line falls below the GWPS, the well is found to have reduced to levels statistically below the GWPS.

As the discussed in the Unified Guidance, "inferences concerning a linear regression are generally appropriate when two conditions hold: 1) the residuals from the regression are approximately normal or at least reasonably symmetric in distribution; and 2) a plot of residuals versus concentrations indicates a scatter cloud of essentially uniform vertical thickness or width." These conditions are assessed through normal probability plots of the regression residuals and plots of residuals against the predicted concentrations.

Data Adjustments Due to Exiting Corrective Action

When analyte/well pairs exit corrective action and return to assessment constituents, the hypothesis testing structure is reversed again. In corrective action mode, compliance point concentrations were presumed to exceed the GWPS, and evidence must be presented to demonstrated regulatory compliance (i.e., UCLs below the GWPS for three consecutive years). With the return to assessment constituents, analyte/well pairs have demonstrated regulatory compliance. The hypothesis testing structure reverts to the assessment monitoring structure where compliance point concentrations are presumed to not exceed the GWPS unless sampling

data indicates otherwise (i.e., LCL is above the GWPS). With this reversion in hypothesis, the focus shifts to evaluating concentration changes in the analyte/well pair that would indicate an increase over the GWPS and re-trigger corrective action. For constituents with historical SSLs, earlier concentrations that had previously triggered corrective action are no longer providing useful information regarding the current assessment monitoring hypothesis. Retaining the historical data during the timeframe in which the GWPS was exceeded will result in the regression or confidence interval methods being slower to respond to new increases. As a result, the historical data prior to when statistical compliance with the GWPS was first achieved will be removed when analyte/well pairs exit corrective action and return to assessment constituents.

Hollow symbols indicate censored values.

Within Limit

Prediction Limit - Detection Monitoring

Interwell Non-parametric

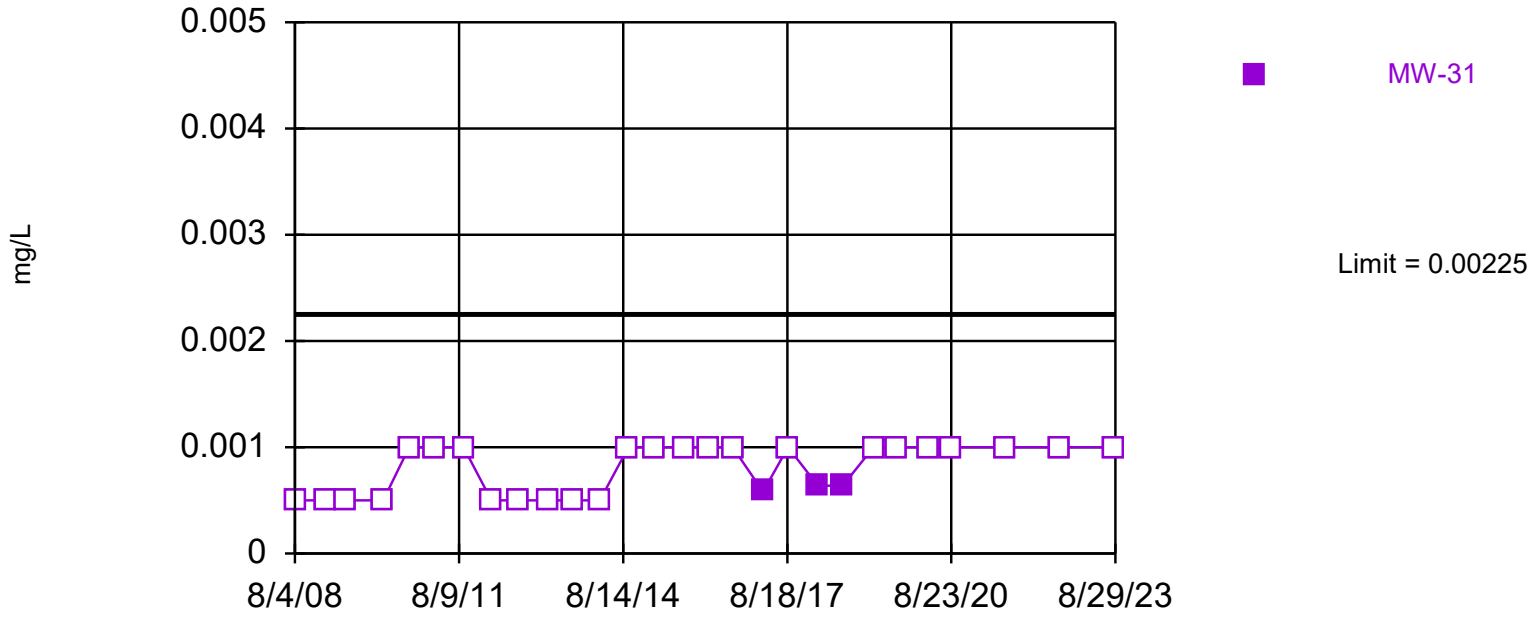
Non-parametric test used in lieu of parametric prediction limit because censored data exceeded 50%. Limit is highest of 47 background values. 95.74% NDs. Annual per-constituent alpha = 0.03639. Individual comparison alpha = 0.0008056 (1 of 2).

Constituent: Antimony Analysis Run 11/11/2023 3:39 PM



Linn County SWAL Client: Foth Data: Site 1 Deeper Bedrock - Fall 2023 Evaluation

Sanitas™ v.10.0.13 Software licensed to Foth Infrastructure & Environment, LLC. UG
Hollow symbols indicate censored values.

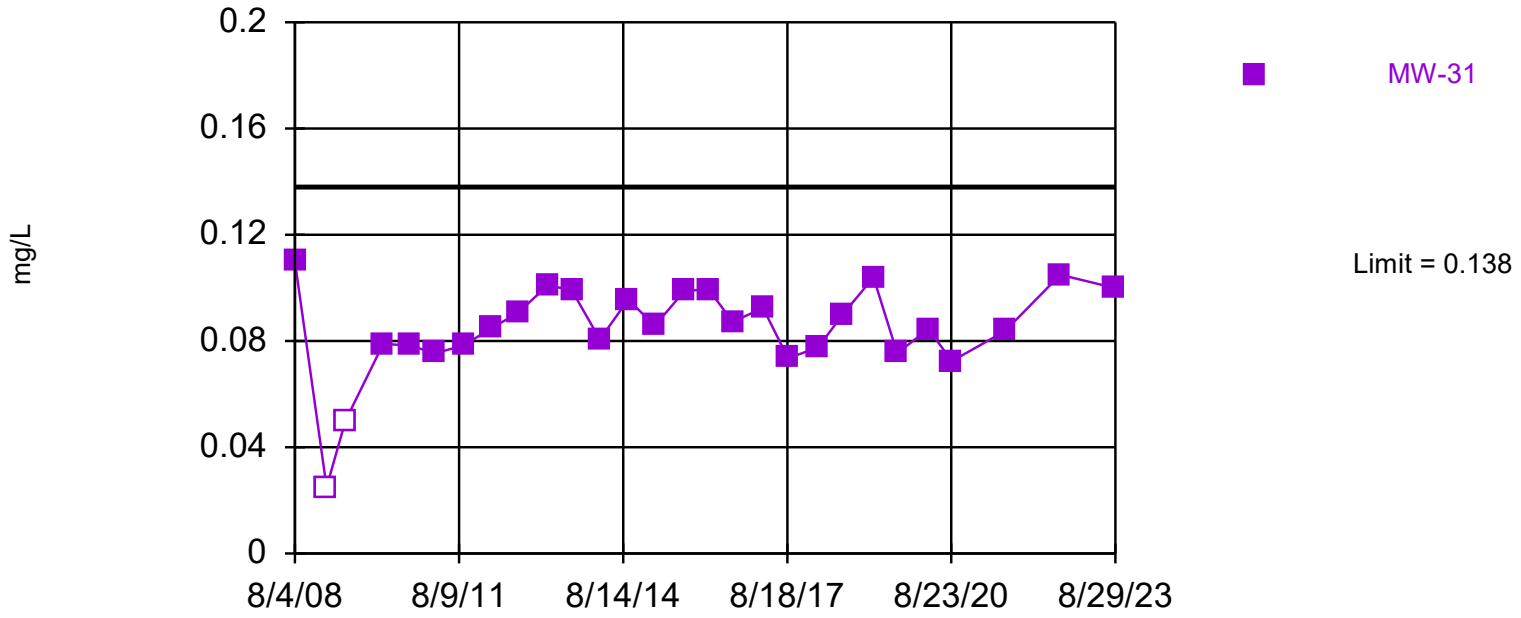
Within Limit

Prediction Limit - Detection Monitoring

Interwell Non-parametric

Non-parametric test used in lieu of parametric prediction limit because the Shapiro Wilk normality test showed the data to be non-normal at the 0.01 alpha level. Limit is highest of 49 background values. 38.78% NDs. Annual per-constituent alpha = 0.03334. Individual comparison alpha = 0.0007368 (1 of 2).

Constituent: Arsenic Analysis Run 11/11/2023 3:39 PM



Linn County SWAL Client: Foth Data: Site 1 Deeper Bedrock - Fall 2023 Evaluation

Sanitas™ v.10.0.13 Software licensed to Foth Infrastructure & Environment, LLC. UG

Sanitas Report Output for Double Quantification Rule Evaluations

Sanitas™ v.10.0.13 Software licensed to Foth Infrastructure & Environment, LLC. UG

Detect Screening - Delineation Monitoring
Analysis Run 11/10/2023 3:01 PM - Assessment Constituents

Linn County SWAL Client: Foth Data: Site 1 Upper Bedrock - Fall 2023 Evaluation

A listing of detects for 209 constituents in MW-105A, MW-106A, MW-107A, and MW-109A in August 2023:

-none-

Sanitas™ v.10.0.13 Software licensed to Foth Infrastructure & Environment, LLC. UG

Detect Screening - Assessment Monitoring

Analysis Run 11/10/2023 12:53 PM

Linn County SWAL Client: Foth Data: Site 1 Upper Bedrock - Fall 2023 Evaluation

A listing of detects for 209 constituents in AW-3, AW-4, AW-5, MW-21, MW-23, MW-26, MW-28, VP-3, and VP-4 in August 2023:

Cadmium, AW-5, 8/28/2023: 0.000219 mg/L
Cadmium, MW-23, 8/28/2023: 0.000228 mg/L
Chlorobenzene, MW-21, 8/28/2023: 2.14 ug/L
Thallium, AW-5, 8/28/2023: 0.00314 mg/L
Thallium, MW-21, 8/28/2023: 0.00156 mg/L
Thallium, MW-23, 8/28/2023: 0.00139 mg/L

Sanitas™ v.10.0.13 Software licensed to Foth Infrastructure & Environment, LLC. UG

Detect Screening - Corrective Action Monitoring

Analysis Run 11/10/2023 5:12 PM **- Assessment Constituents**

Linn County SWAL Client: Foth Data: Site 1 Upper Bedrock - Fall 2023 Evaluation

A listing of detects for 209 constituents in AW-1, AW-2, MW-12, MW-13, MW-16, MW-17, MW-20, MW-24, MW-30, MW-32, MW-34, and MW-35 in August 2023:

1,1-Dichloroethane, MW-12, 8/24/2023: 3.58 ug/L
1,1-Dichloroethane, MW-16, 8/23/2023: 1.77 ug/L
1,1-Dichloroethane, MW-30, 8/29/2023: 7.97 ug/L
1,1-Dichloroethane, MW-34, 8/24/2023: 4.75 ug/L
1,2-Dichlorobenzene, MW-13, 8/22/2023: 1.24 ug/L
1,2-Dichlorobenzene, MW-24, 8/30/2023: 5.07 ug/L
1,4-Dichlorobenzene, AW-1, 8/28/2023: 1.19 ug/L
1,4-Dichlorobenzene, MW-12, 8/24/2023: 1.24 ug/L
1,4-Dichlorobenzene, MW-13, 8/22/2023: 12.9 ug/L
1,4-Dichlorobenzene, MW-24, 8/30/2023: 11.9 ug/L
1,4-Dichlorobenzene, MW-32, 8/29/2023: 3.42 ug/L
1,4-Dichlorobenzene, MW-34, 8/24/2023: 2.17 ug/L
Benzene, MW-13, 8/22/2023: 3.51 ug/L
Benzene, MW-16, 8/23/2023: 0.534 ug/L
Benzene, MW-24, 8/30/2023: 7.69 ug/L
Benzene, MW-30, 8/29/2023: 1.29 ug/L
Benzene, MW-32, 8/29/2023: 0.647 ug/L
Benzene, MW-34, 8/24/2023: 1.56 ug/L
Chlorobenzene, AW-1, 8/28/2023: 4.09 ug/L
Chlorobenzene, AW-2, 8/22/2023: 1.57 ug/L
Chlorobenzene, MW-12, 8/24/2023: 2.23 ug/L
Chlorobenzene, MW-13, 8/22/2023: 3.49 ug/L
Chlorobenzene, MW-16, 8/23/2023: 2.02 ug/L
Chlorobenzene, MW-24, 8/30/2023: 68 ug/L
Chlorobenzene, MW-32, 8/29/2023: 8.06 ug/L
Chlorobenzene, MW-34, 8/24/2023: 2.41 ug/L
Chloroethane, MW-30, 8/29/2023: 8.67 ug/L
cis-1,2-Dichloroethene, AW-2, 8/22/2023: 2.87 ug/L
cis-1,2-Dichloroethene, MW-12, 8/24/2023: 3.55 ug/L
cis-1,2-Dichloroethene, MW-30, 8/29/2023: 5.56 ug/L
cis-1,2-Dichloroethene, MW-34, 8/24/2023: 6.03 ug/L
Thallium, AW-1, 8/28/2023: 0.0012 mg/L
Thallium, MW-12, 8/24/2023: 0.00211 mg/L
Thallium, MW-24, 8/30/2023: 0.0015 mg/L
trans-1,2-Dichloroethene, MW-34, 8/24/2023: 1.02 ug/L
Vinyl Chloride, MW-30, 8/29/2023: 1.65 ug/L

Sanitas™ v.10.0.13 Software licensed to Foth Infrastructure & Environment, LLC. UG

Detect Screening - Detection Monitoring

Analysis Run 11/12/2023 12:35 PM

Linn County SWAL Data: Site 1 Deeper Bedrock - Fall 2023 Evaluation

A listing of detects for 208 constituents in MW-31 in August 2023:

-none-

Sanitas™ v.10.0.13 Software licensed to Foth Infrastructure & Environment, LLC. UG

Detect Screening - Delineation Monitoring Assessment Constituents

Analysis Run 11/12/2023 12:39 PM
Linn County SWAL Data: Site 1 Deeper Bedrock - Fall 2023 Evaluation

A listing of detects for 208 constituents in MW-102B, MW-105B, MW-107B, MW-108B, and MW-109B in August 2023:

1,1-Dichloroethane, MW-105B, 8/23/2023: 2.49 ug/L
Chlorobenzene, MW-109B, 8/24/2023: 6.68 ug/L
Thallium, MW-107B, 8/22/2023: 0.002 mg/L

Sanitas™ v.10.0.13 Software licensed to Foth Infrastructure & Environment, LLC. UG

Detect Screening - Assessment Monitoring

Analysis Run 11/12/2023 12:41 PM
Linn County SWAL Data: Site 1 Deeper Bedrock - Fall 2023 Evaluation

A listing of detects for 208 constituents in MW-11, MW-15, MW-18, MW-19, and MW-25 in August 2023:

Lead, MW-25, 8/30/2023: 0.0006 mg/L
Thallium, MW-25, 8/30/2023: 0.00307 mg/L

Sanitas™ v.10.0.13 Software licensed to Foth Infrastructure & Environment, LLC. UG

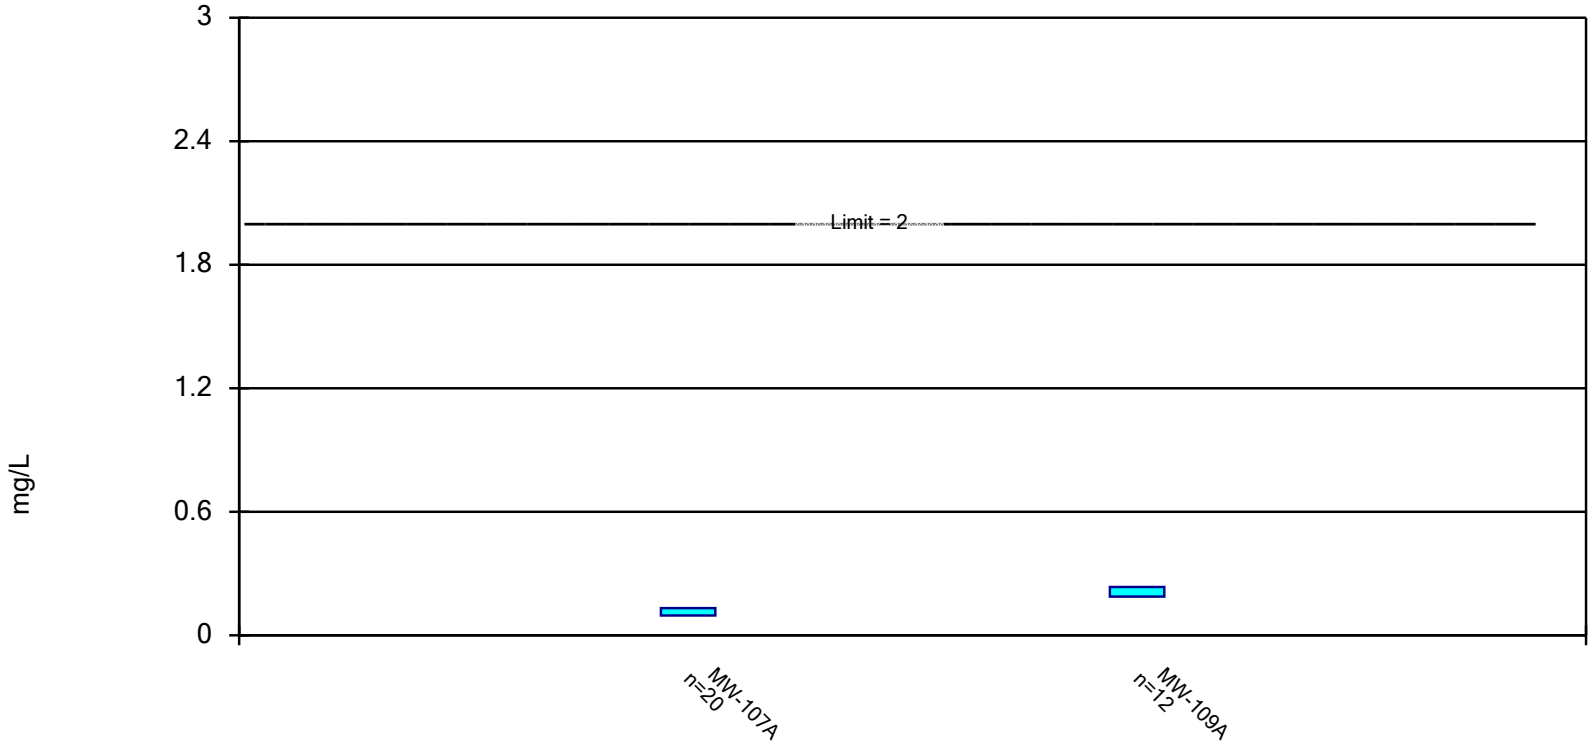
[1] Under assessment mode, an SSL is indicated when the lower confidence limit exceeds the groundwater protection standard (compliance limit).



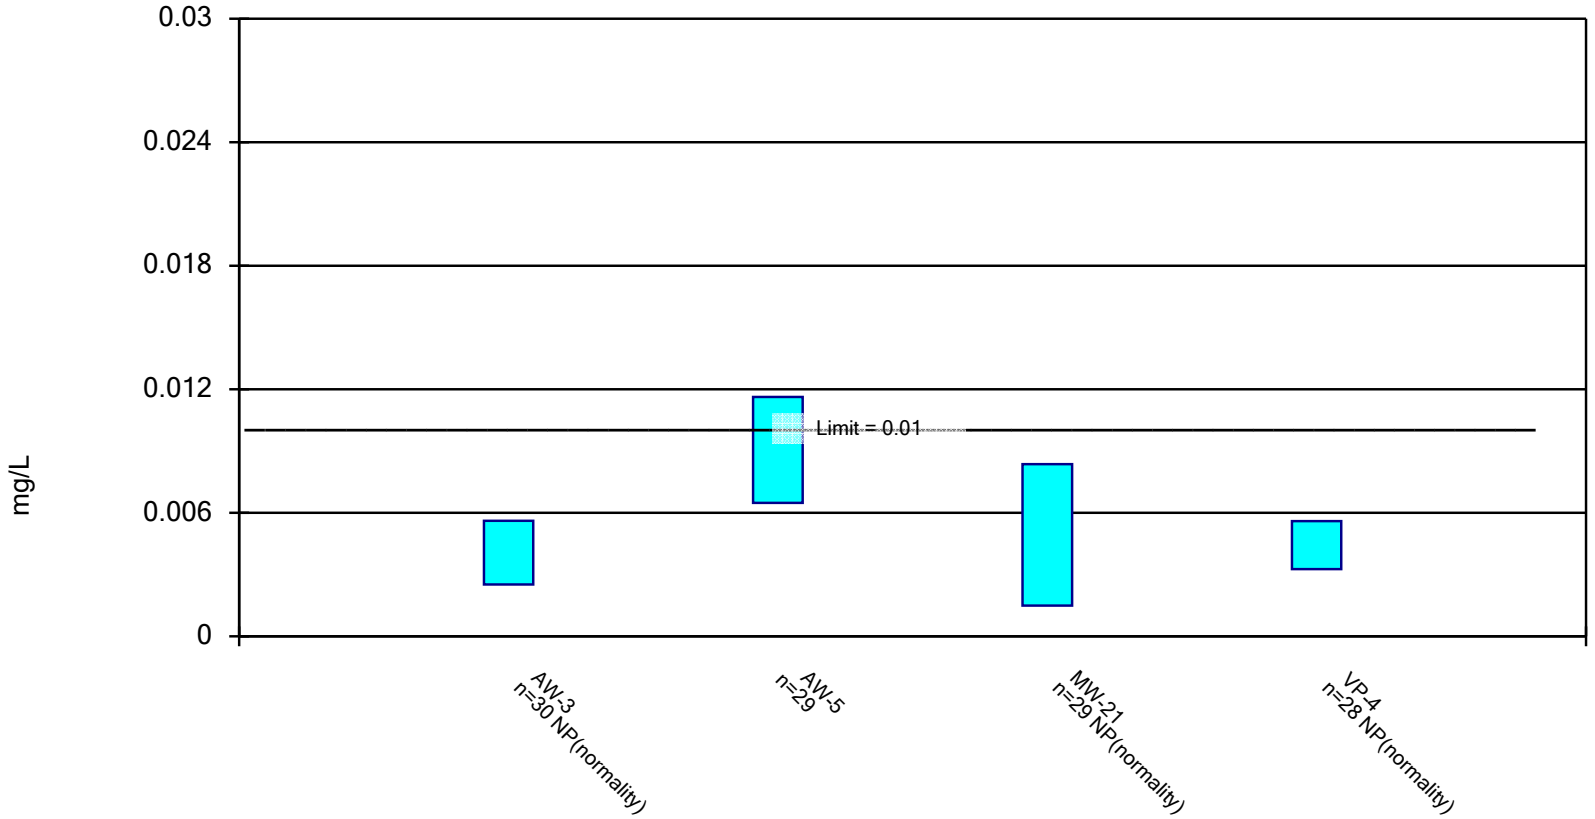
[2] Value is the 40 CFR Part 141 Safe Drinking Water Act MCL or the IAC 567 Chapter 137 Statewide Standard for a Protected Groundwater Source.

[3] For parametric confidence intervals: Except where otherwise indicated, based on Unified Guidance Equation 22.2, i.e., $\alpha \sim 1 - F_{T,n-1}\left(\frac{(R-1)\sqrt{n}}{R \cdot \widehat{CV}} - t_{1-\beta,n-1}\right)$ where R is the desired risk ratio, n is the sample size, CV is the estimated sample coefficient of variation, $t_{1-b,n-1}$ is the (1−b) Student's t-quantile with (n−1) degrees of freedom, and F is the cumulative (central) Student's t-distribution function.

[4] For non-parametric confidence intervals: Based on Unified Guidance Equation 22.1, i.e., $1-\beta = G_{T,n-1}\left(t_{1-\alpha,n-1}\middle|\Delta = \sqrt{n}(R-1)\right)$ where R is the desired risk ratio, $t_{1-a,n-1}$ is the (1−a) Student's t-quantile with (n−1) degrees of freedom and G represents the cumulative non-central t-distribution with (n−1) degrees of freedom and noncentrality parameter D.

Parametric Confidence Interval - Delineation Monitoring - Assessment Constituents

Compliance Limit is not exceeded. Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.



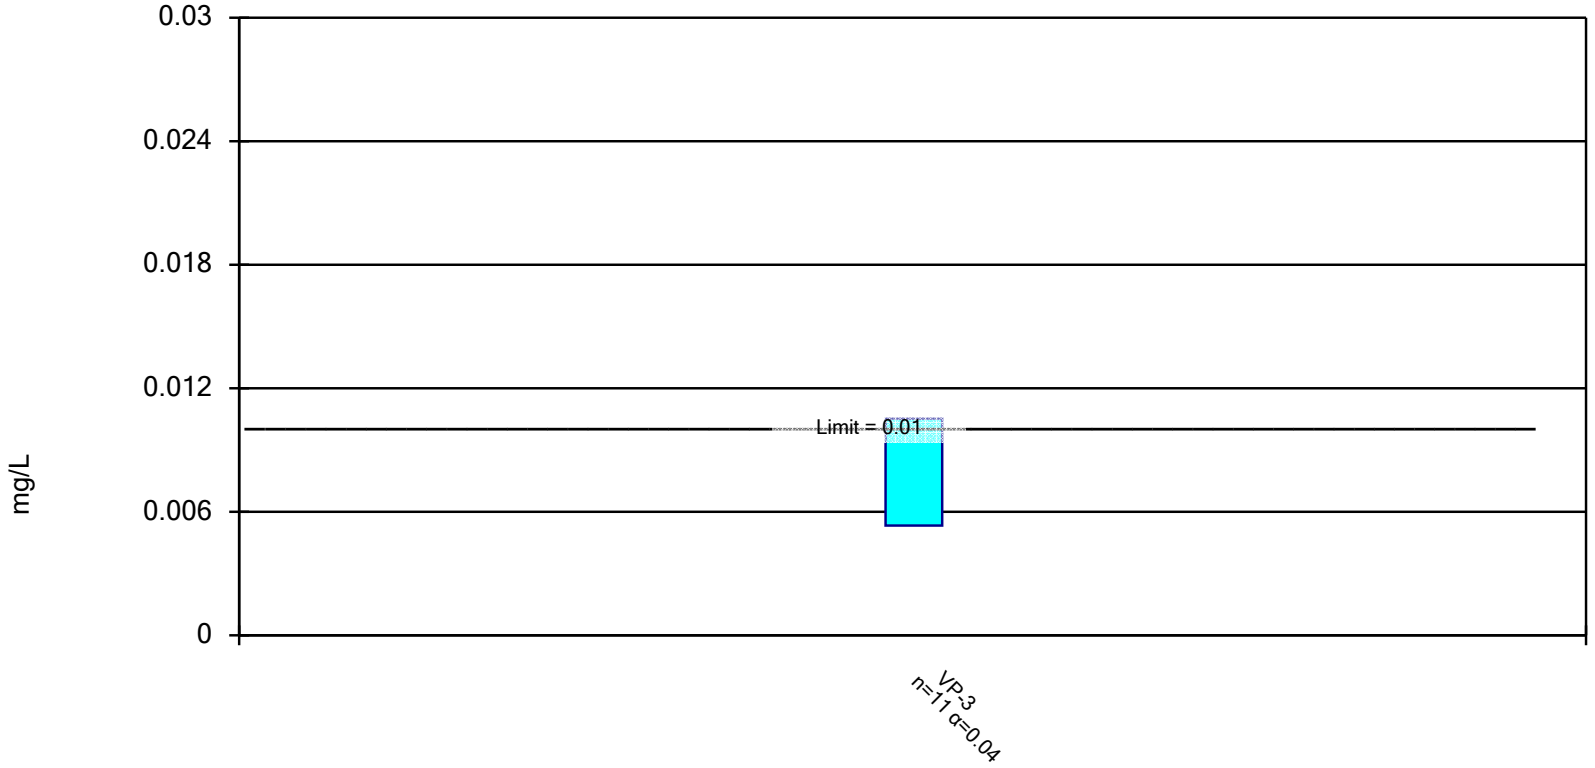
Constituent: Barium Analysis Run 11/13/2023 8:13 AM

Linn County SWAL Client: Foth Data: Site 1 Upper Bedrock - Fall 2023 Evaluation

Sanitas™ v.10.0.13 Software licensed to Foth Infrastructure & Environment, LLC. UG

Parametric and Non-Parametric (NP) Confidence Interval - Assessment Monitoring

Compliance Limit is not exceeded. Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.



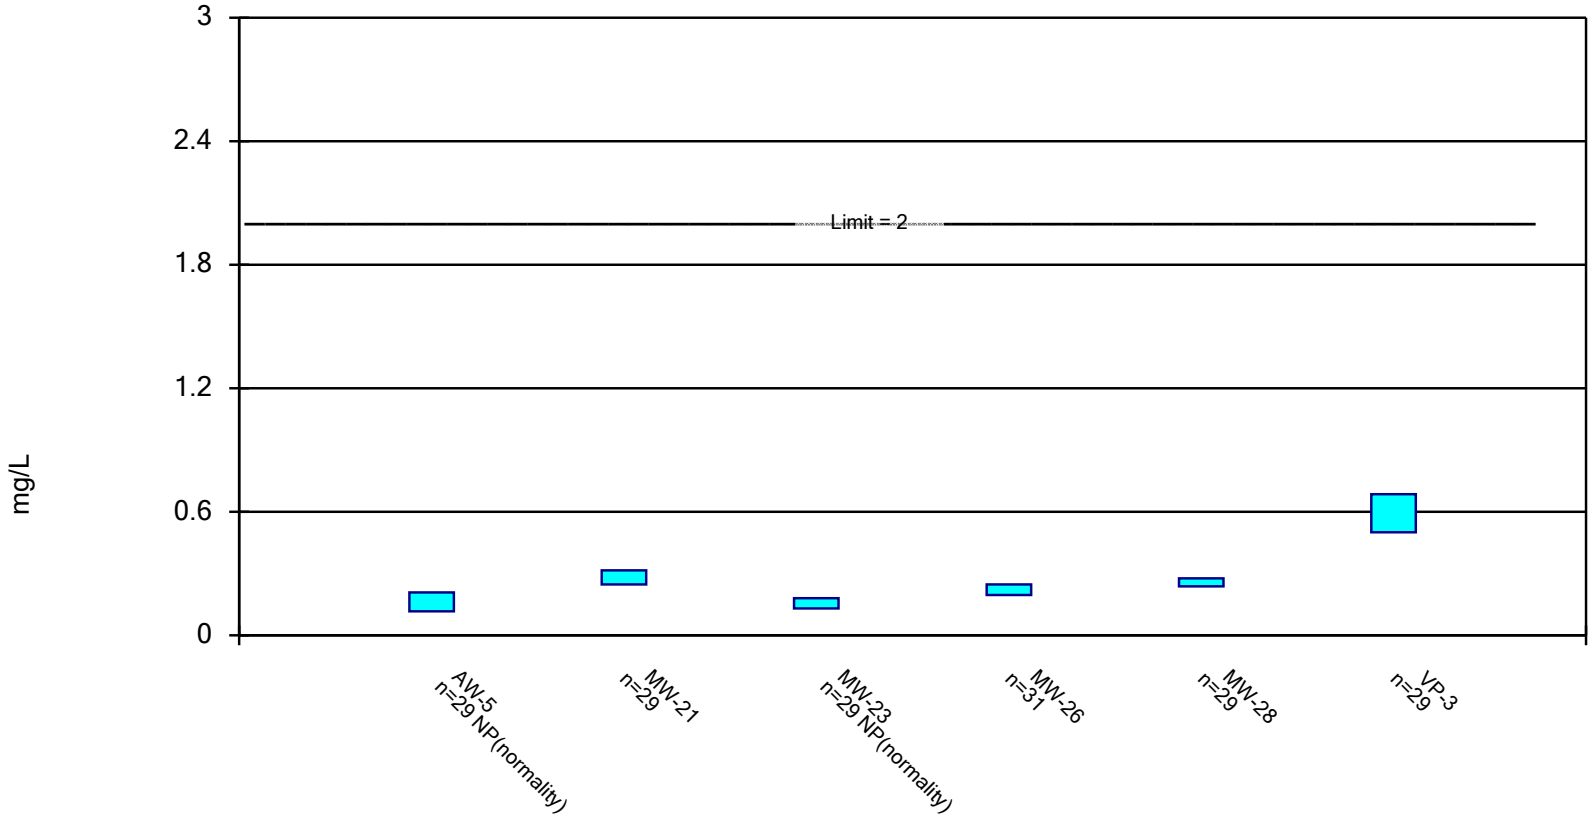
Constituent: Arsenic Analysis Run 11/13/2023 7:29 AM

Linn County SWAL Client: Foth Data: Site 1 Upper Bedrock - Fall 2023 Evaluation

Sanitas™ v.10.0.13 Software licensed to Foth Infrastructure & Environment, LLC. UG

Parametric Confidence Intervall - Assessment Monitoring

Compliance Limit is not exceeded. Normality Test: Shapiro Wilk, alpha based on n.



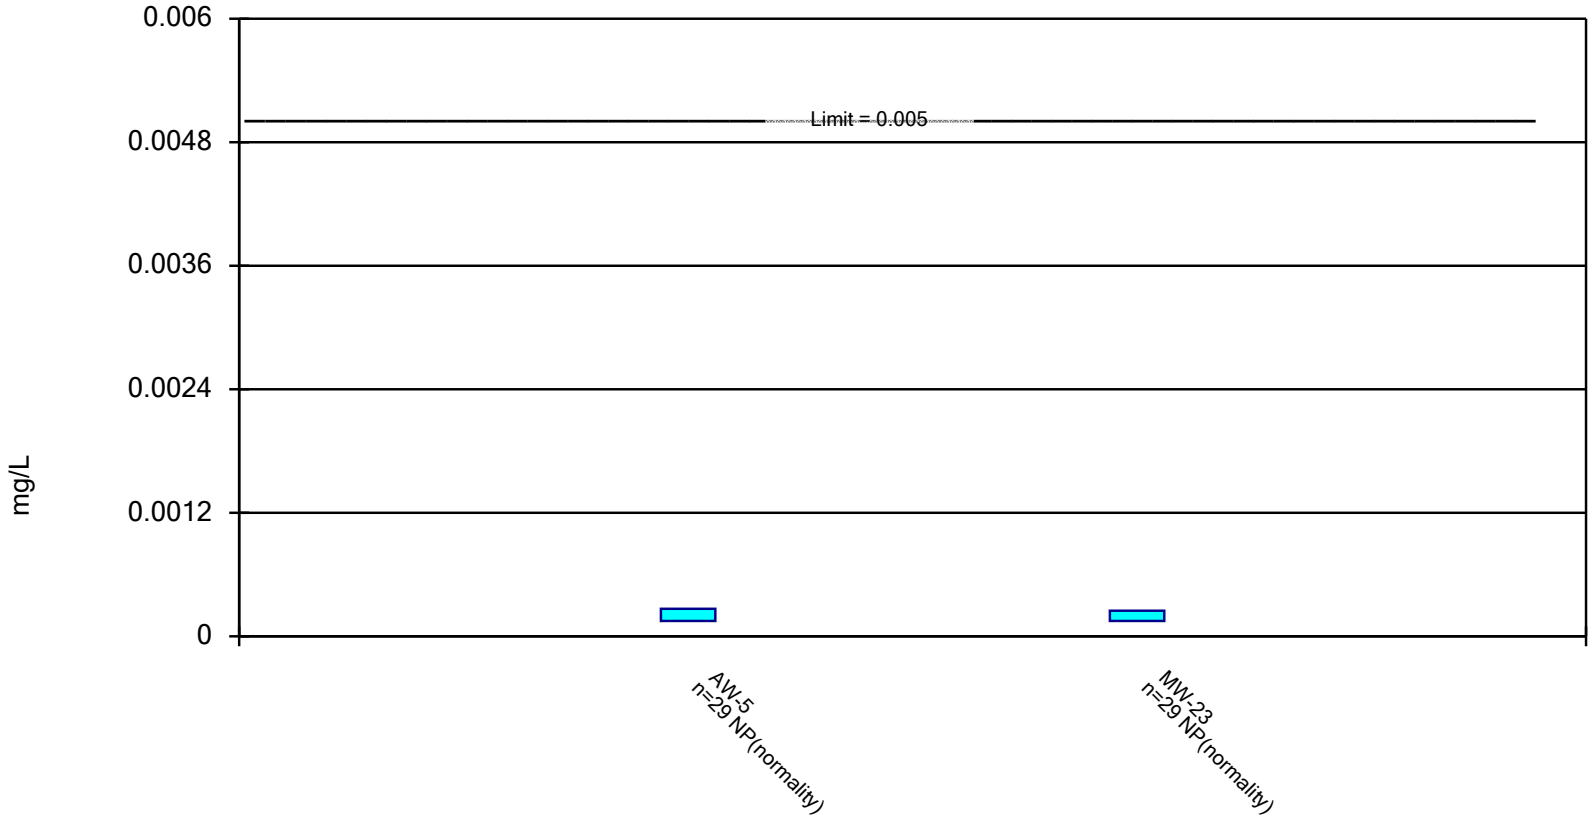
Constituent: Arsenic Analysis Run 11/13/2023 8:09 AM

Linn County SWAL Client: Foth Data: Site 1 Upper Bedrock - Fall 2023 Evaluation

Sanitas™ v.10.0.13 Software licensed to Foth Infrastructure & Environment, LLC. UG

Parametric and Non-Parametric (NP) Confidence Interval - Assessment Monitoring

Compliance Limit is not exceeded. Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.



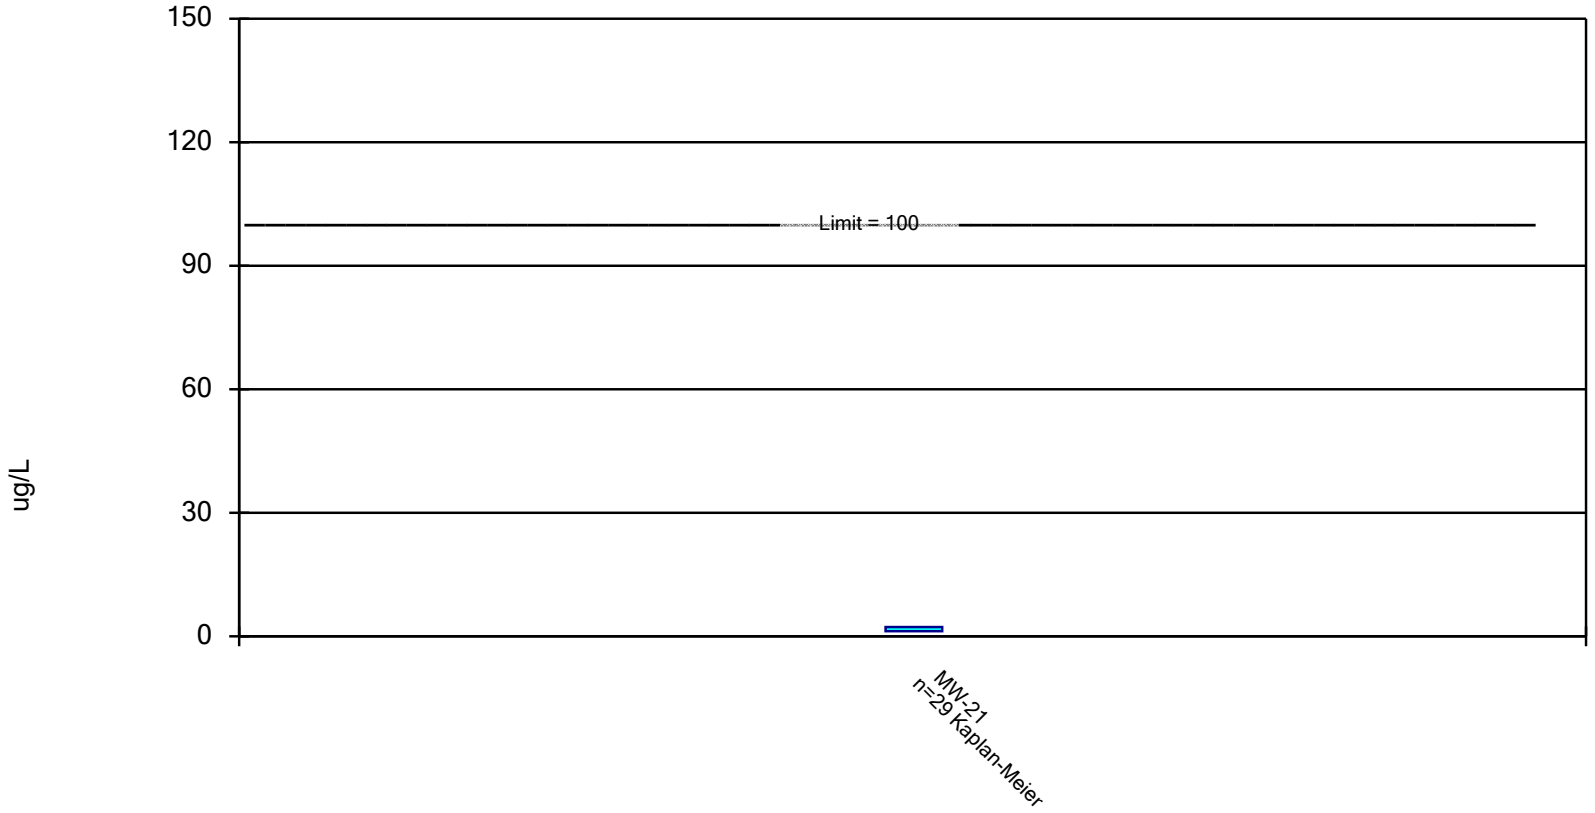
Constituent: Barium Analysis Run 11/13/2023 7:29 AM

Linn County SWAL Client: Foth Data: Site 1 Upper Bedrock - Fall 2023 Evaluation

Sanitas™ v.10.0.13 Software licensed to Foth Infrastructure & Environment, LLC. UG

Non-Parametric Confidence Interval - Assessment Monitoring

Compliance Limit is not exceeded. Per-well alpha = 0.01.

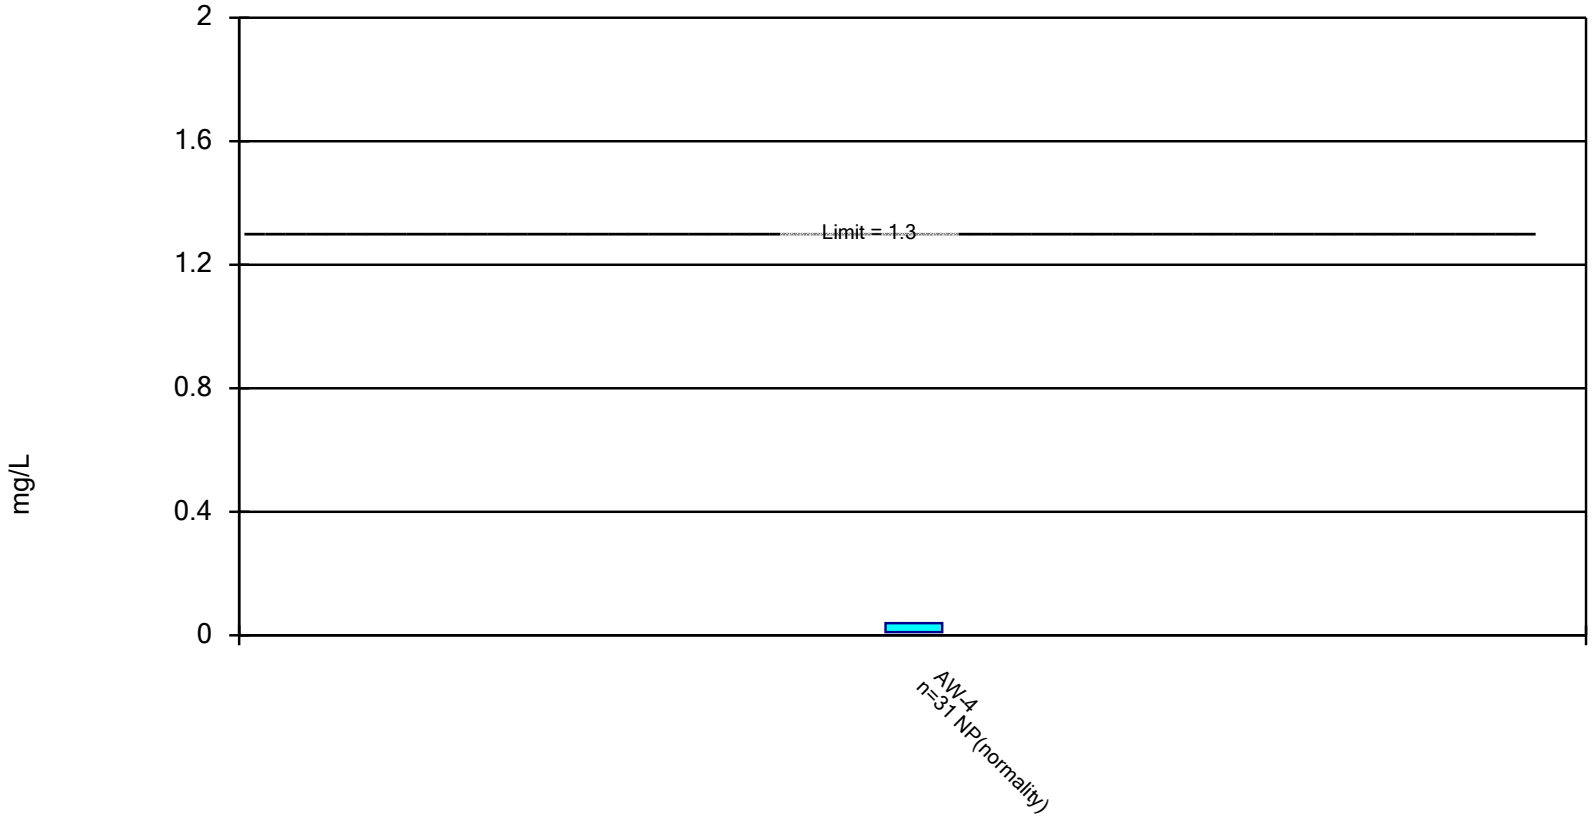


Constituent: Cadmium Analysis Run 11/13/2023 7:29 AM

Linn County SWAL Client: Foth Data: Site 1 Upper Bedrock - Fall 2023 Evaluation

Parametric Confidence Interval - Assessment Monitoring

Compliance Limit is not exceeded. Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.



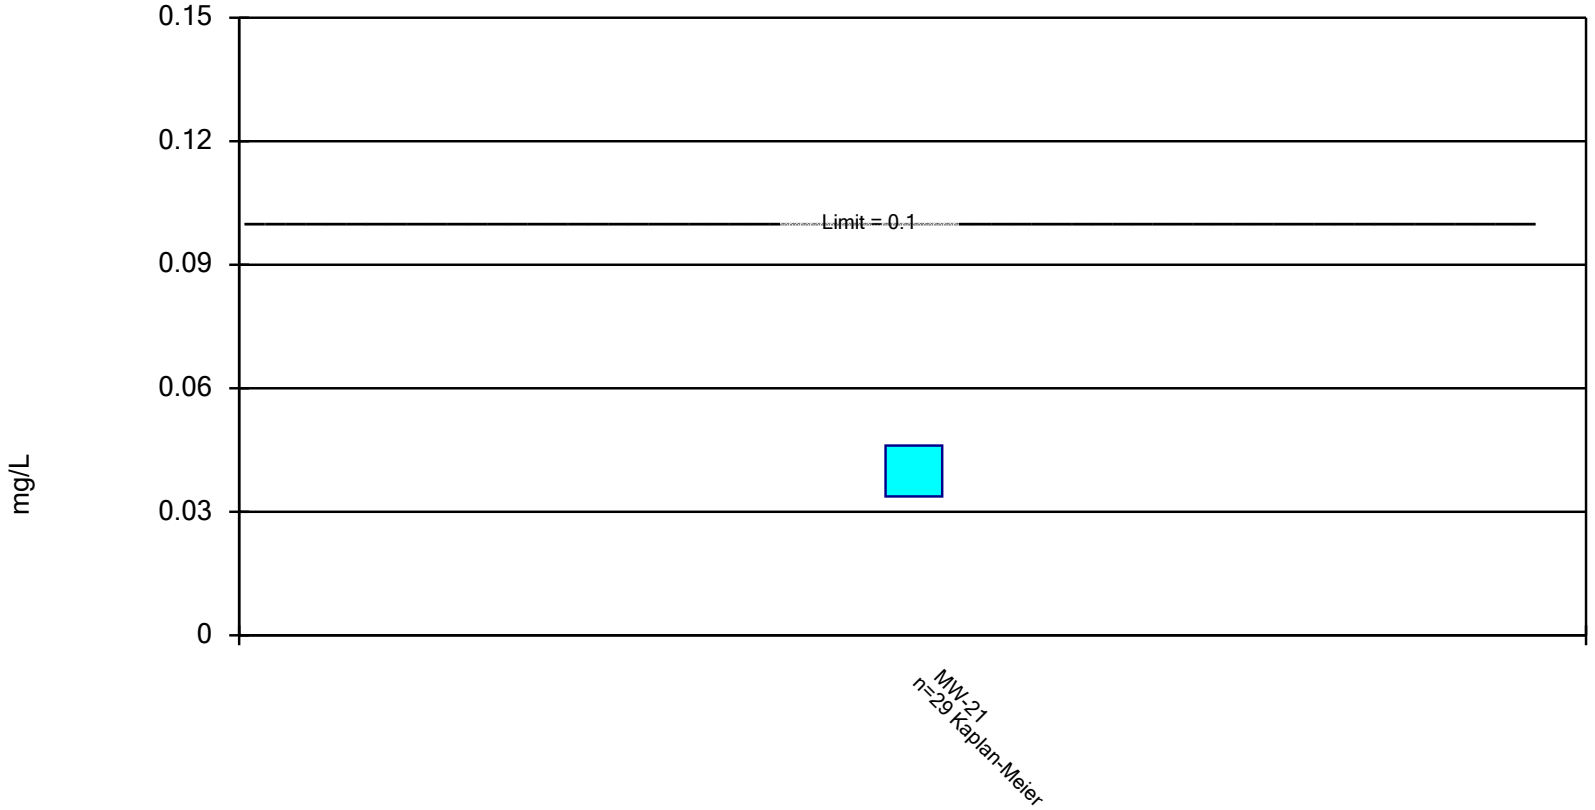
Constituent: Chlorobenzene Analysis Run 11/13/2023 7:29 AM

Linn County SWAL Client: Foth Data: Site 1 Upper Bedrock - Fall 2023 Evaluation

Sanitas™ v.10.0.13 Software licensed to Foth Infrastructure & Environment, LLC. UG

Non-Parametric Confidence Interval - Assessment Monitoring

Compliance Limit is not exceeded. Per-well alpha = 0.01.



Constituent: Copper Analysis Run 11/13/2023 7:29 AM

Linn County SWAL Client: Foth Data: Site 1 Upper Bedrock - Fall 2023 Evaluation

Deeper Bedrock

Confidence Interval - Assessment Mode [1]

Constituent Name	Well	Upper Limit	Lower Limit	Compliance Limit [2]	Exceed	N	Mean	Standard Deviation	CV	a to Achieve 50% Power at R=1.5 [3,4]	a to Achieve 80% Power at R=2.0 [3,4]	% Non-detects	Non-detect Adjustment	Transformation	Alpha	Method
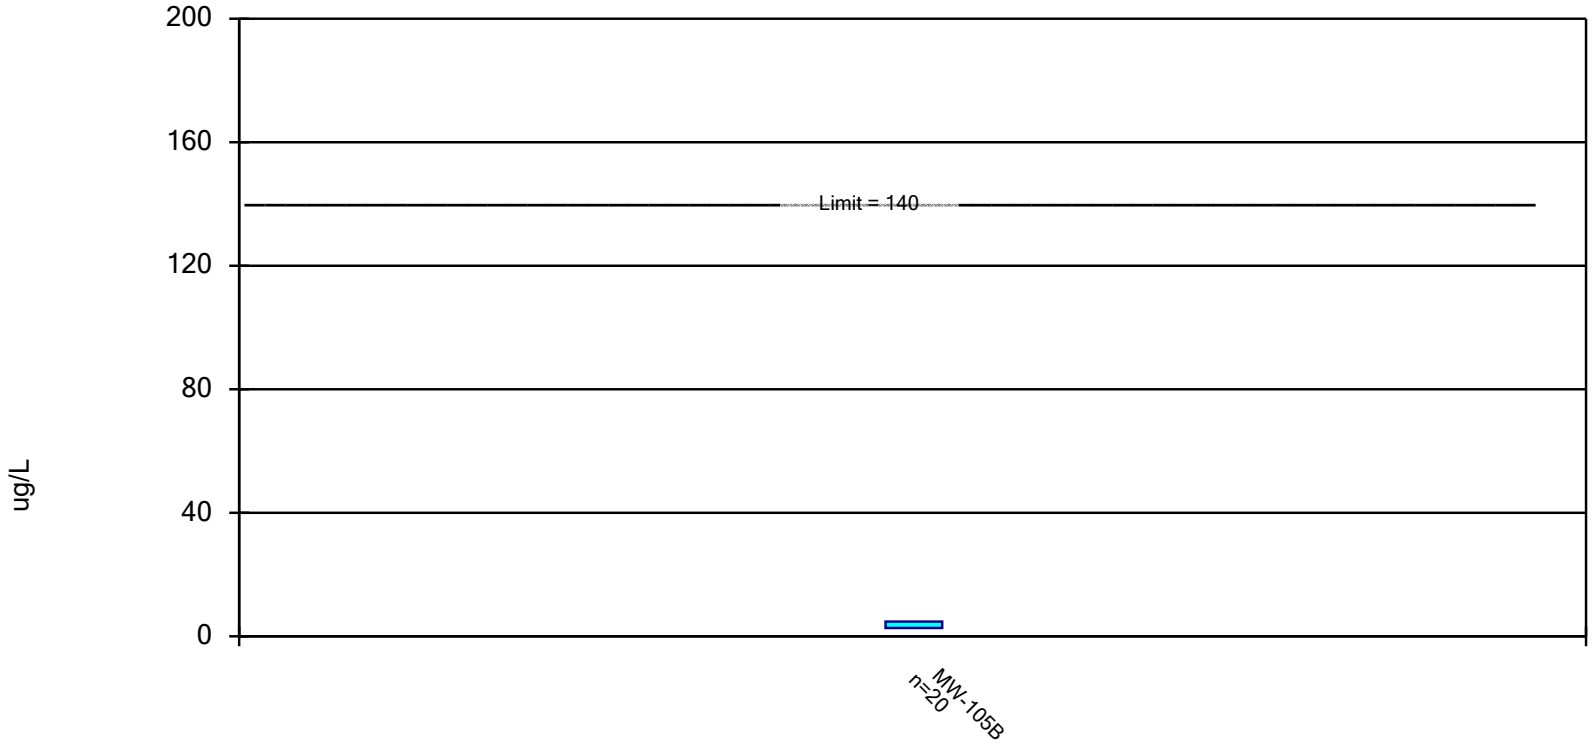
Corrective Action Monitoring Locations - Assessment Constituents (Continued)																
Thallium (mg/L)	MW-22	0.00100	0.00050	0.002	No	28	0.00110	0.00119	1.1	<0.01	<0.01	96	None	No	0.01	NP (NDs)

[1] Under assessment mode, an SSL is indicated when the lower confidence limit exceeds the groundwater protection standard (compliance limit).



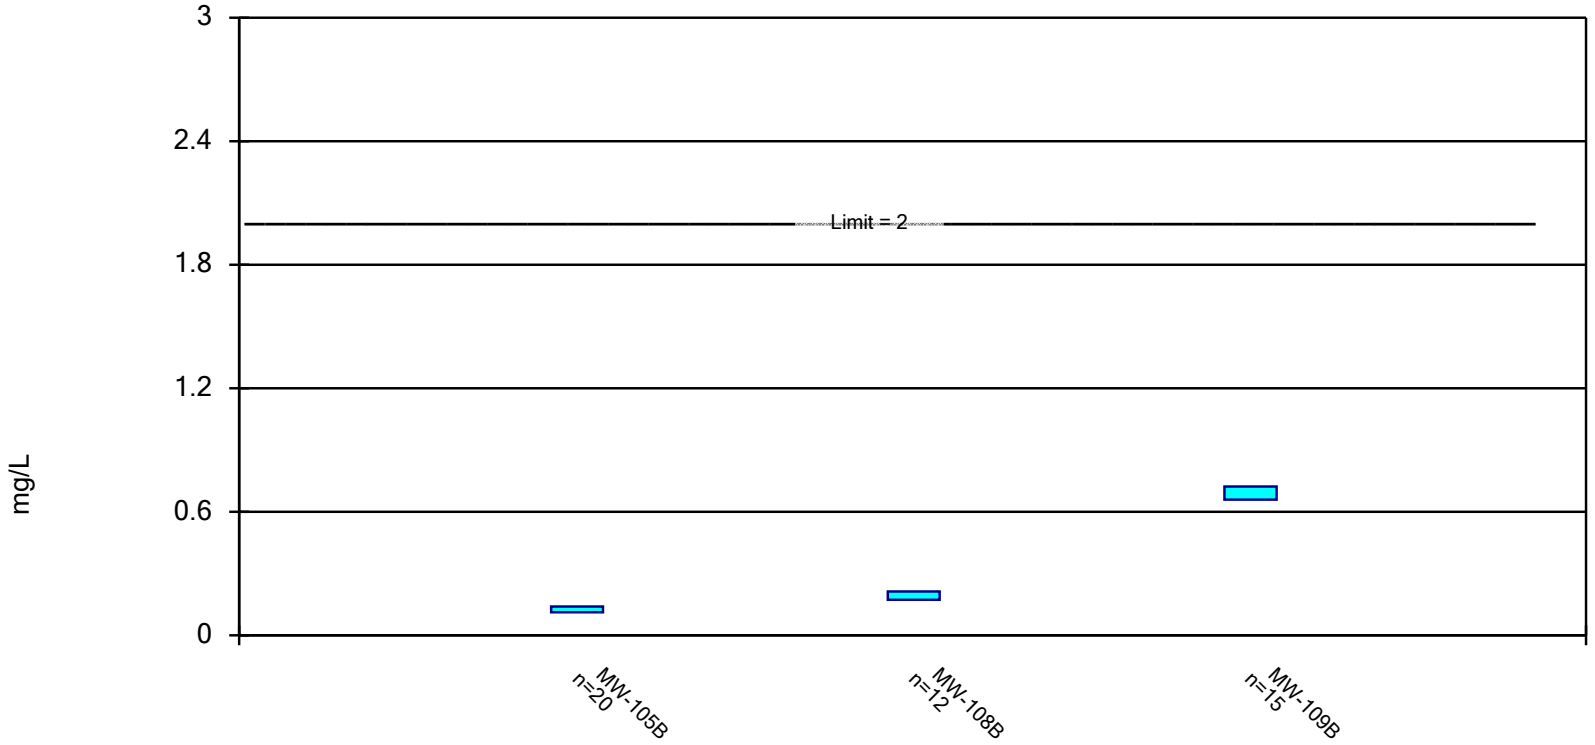
[2] Value is the 40 CFR Part 141 Safe Drinking Water Act MCL or the IAC 567 Chapter 137 Statewide Standard for a Protected Groundwater Source.

[3] For parametric confidence intervals: Except where otherwise indicated, based on Unified Guidance Equation 22.2, i.e., $\alpha \sim 1 - F_{T,n-1}\left(\frac{(R-1)\sqrt{n}}{R \cdot \widehat{CV}} - t_{1-\beta,n-1}\right)$
where R is the desired risk ratio, n is the sample size, CV is the estimated sample coefficient of variation, $t_{1-b,n-1}$ is the (1−b) Student's t-quantile with (n−1) degrees of freedom, and F is the cumulative (central) Student's t-distribution function.

[4] For non-parametric confidence intervals: Based on Unified Guidance Equation 22.1, i.e., $1-\beta = G_{T,n-1}\left(t_{1-\alpha,n-1} \middle| \Delta = \sqrt{n}(R-1)\right)$
where R is the desired risk ratio, $t_{1-a,n-1}$ is the (1−a) Student's t-quantile with (n−1) degrees of freedom and G represents the cumulative non-central t-distribution with (n−1) degrees of freedom and noncentrality parameter D.

Parametric Confidence Interval - Delineation Monitoring Assessment Constituents

Compliance Limit is not exceeded. Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.



Constituent: 1,1-Dichloroethane Analysis Run 11/13/2023 9:33 AM

Linn County SWAL Data: Site 1 Deeper Bedrock - Fall 2023 Evaluation

Parametric Confidence Interval - Delineation Monitoring Assessment Constituents

Compliance Limit is not exceeded. Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

Thallium (mg/L)	AW-2	Evaluated with Linear Regression Confidence Band Testing Method. Significant Decreasing Trend in Data.											
Thallium (mg/L)	MW-20	Evaluated with Linear Regression Confidence Band Testing Method. Significant Decreasing Trend in Data.											
Vinyl Chloride (ug/l)	MW-34	Evaluated with Linear Regression Confidence Band Testing Method. Significant Decreasing Trend in Data.											

[1] Under corrective action mode, an SSL is rejected when the upper confidence limit lies below the groundwater protection standard (compliance limit).

[2] Value is the 40 CFR Part 141 Safe Drinking Water Act MCL or the IAC 567 Chapter 137 Statewide Standard for a Protected Groundwater Source.

[3] Using the one-sample testing method, the fixed GWPS for cobalt was calculated as the background upper tolerance limit with 95% confidence and 95% coverage. Note that a nonparametric tolerance limit was utilized in the cobalt background calculation. The nonparametric limit achieves 90% coverage.

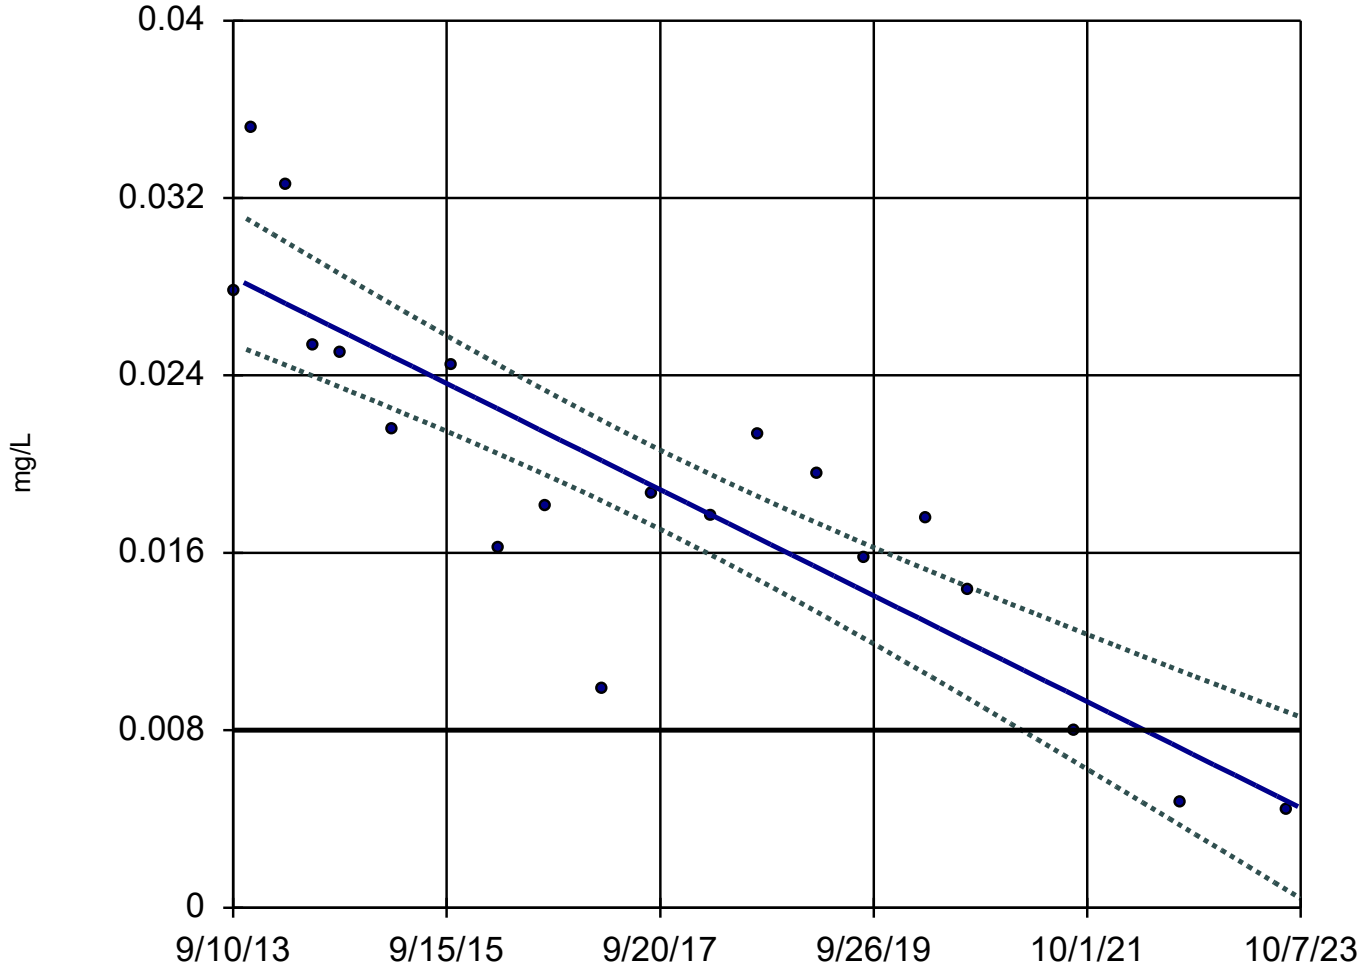
GWPS (Background) [(1)] = 0.008 mg//L

[(1)] Using the *one-sample* testing method, the fixed GWPS was calculated as the background upper tolerance limit with 95% confidence and 95% coverage.
Note that a nonparametric tolerance limit was utilized in the cobalt background calculation. The nonparametric limit achieves 90% coverage.

Projected Year to Attain Compliance with the GWPS (Assuming Future First Order Attenuation Instead of Linear Decay)*

4/9/2022 -4.828 0.008

Projected Year to Completion



4/8/2025

*The first order attenuation rate projected that compliance with the GWPS has already been achieved. However, the confidence band placed around the linear trend line (above), has not yet indicated compliance with the GWPS (although it is noted that upper 95% confidence limit is close to statistically achieving compliance with the GWPS and the Aug. 2022 and Aug. 2023 individual results were below the GWPS). For cobalt in MW-105A, it is assumed that compliance with the GWPS will be attained in 2024.

GWPS = 0.01 mg/L

Projected Year to Attain Compliance with the GWPS with First Order Attenuation

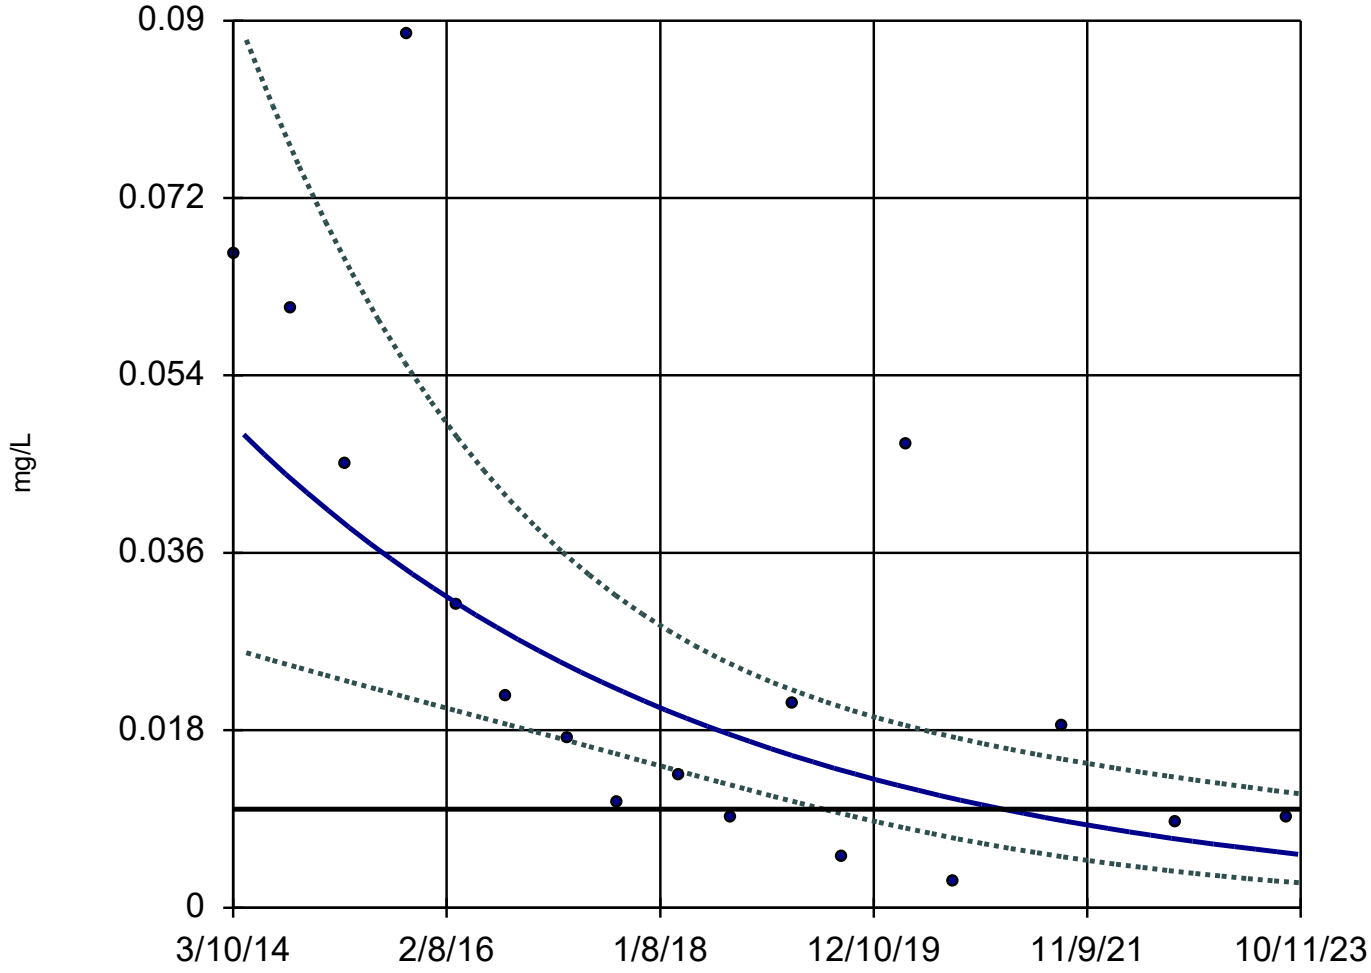
2/4/2021 -4.605 0.01

Projected Year to Completion*



2027

*The first order attenuation rate projected that compliance with the GWPS has already been achieved. However, the confidence band placed around the linear trend line (above), has not yet indicated compliance with the GWPS (although it is noted that upper 95% confidence limit is close to statistically achieving compliance with the GWPS and the Aug. 2022 and Aug. 2023 individual results were below the GWPS). For arsenic in MW-30, it is assumed that compliance with the GWPS will be attained in 2024.

GWPS (Background) [(1)] = 0.008 mg//L

[(1)] Using the *one-sample* testing method, the fixed GWPS was calculated as the background upper tolerance limit with 95% confidence and 95% coverage. Note that a nonparametric tolerance limit was utilized in the cobalt background calculation. The nonparametric limit achieves 85% coverage.

First Achieved Compliance with the GWPS

GWPS = 0.002 mg//L

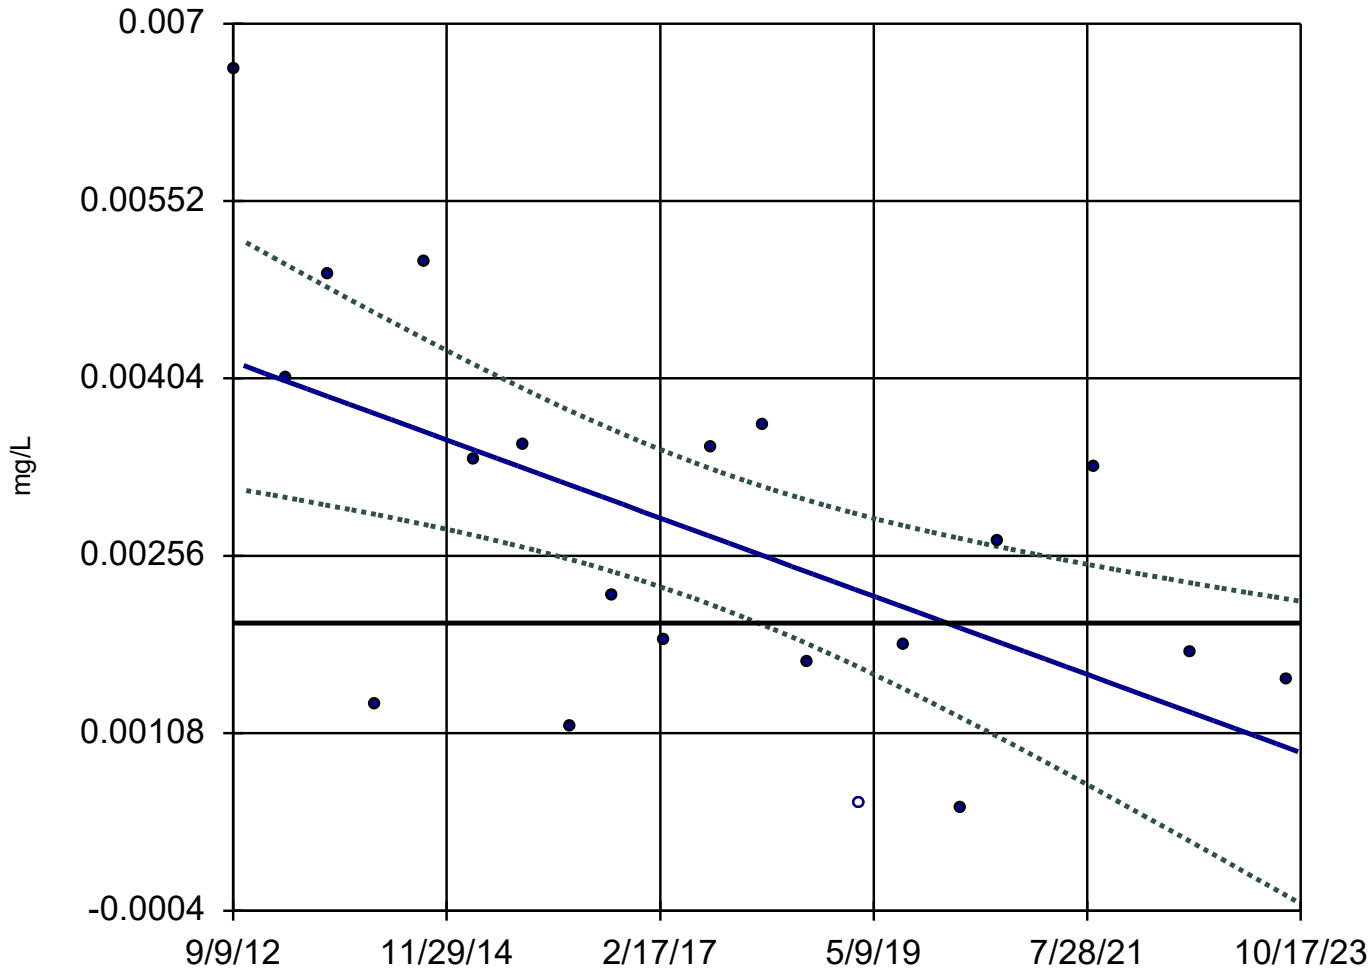
Projected Year to Attain Compliance with the GWPS (Assuming Future First Order Attenuation Instead of Linear Decay)*

8/24/2018 -6.215 0.002

Projected Year to Completion*



2027

*During the Spring 2020 statistical evaluation, the confidence band placed around the linear trend line indicated compliance with the GWPS; however, the higher concentrations in Aug. 2020 and Aug. 2021 prevented compliance with the GWPS from being maintained. The Aug. 2022 and Aug. 2023 results returned to concentrations below the GWPS. While the first order attenuation rate projected that compliance with the GWPS has already been achieved, the confidence band placed around the linear trend line (above), has not yet indicated a return to compliance with the GWPS (although it is noted that upper 95% confidence limit is close to statistically achieving compliance with the GWPS and the Aug. 2022 and Aug. 2023 individual results were below the GWPS). For thallium in MW-20, it is assumed that compliance with the GWPS will be attained in 2024.

Effective Power and Site-Wide False Positive Rate Discussion

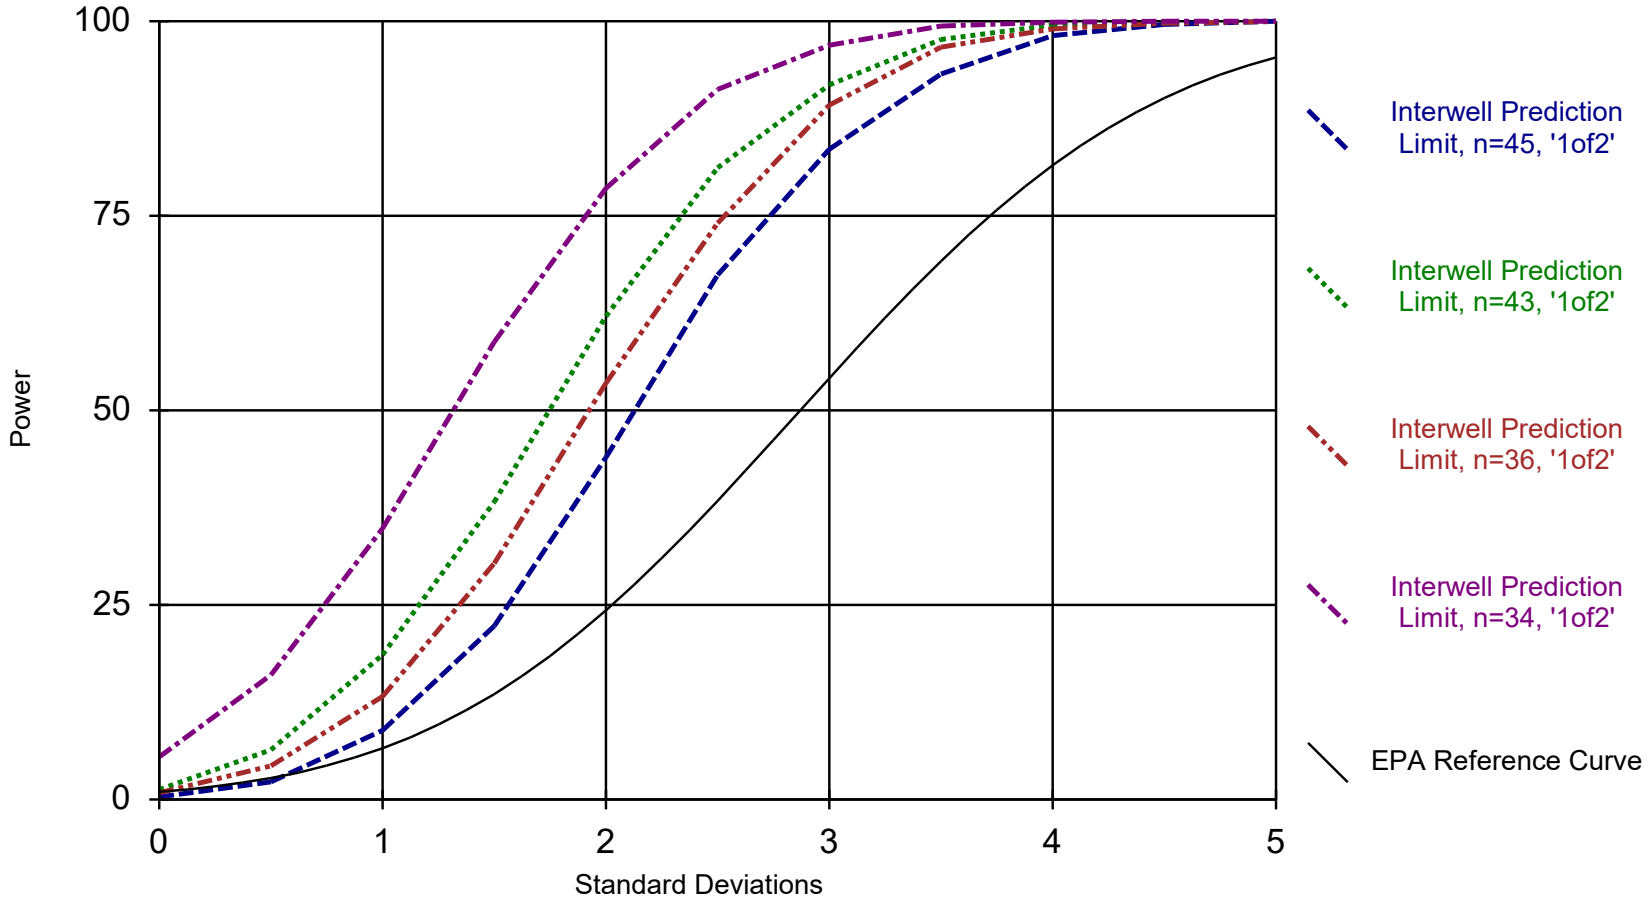
Effective Power and Site-Wide False Positive Rate

Statistical power refers to the ability of a test to identify real increases in concentration levels given they exist. The Unified Guidance defines the effective power as the "probability of detecting contamination in the monitoring network when one and only one well-constituent pair is contaminated." It further states that any statistical test procedure with effective power at least as high as the appropriate USEPA Reference Power Curve (ERPC) should be considered to have reasonable power.

The Unified Guidance gives the following criteria for comparing the effective power to the ERPC:

If the effective power first exceeds the ERPC at a mean concentration increase no greater than 3 background standard deviations, the power is labeled 'good;' if the effective power first exceeds the ERPC at a mean increase between 3 and 4 standard deviations, the power is considered 'acceptable;' and if the first exceedance of the ERPC does not occur until an increase greater than 4 standard deviations, the power is considered 'low.'

Effective power curves were developed with Sanitas for the 1-of-2 prediction limit plan, with power curves illustrated below. Based on the power curves, the parametric and non-parametric prediction limits have good power.



The Unified Guidance "strongly encourages use of a comprehensive design strategy to account for both the cumulative SWFPR and effective power to identify real exceedances." The Unified Guidance recommends and uses an annual SWFPR target of 10%. The current annual SWFPR based on the 1-of-2 prediction limit plan may be calculated using the basic subdivision principle discussed in Unified Guidance Sections 6.2.2, 19.2.1 and 19.4.

Currently, comparisons were made at 9 wells semiannually and 43 wells annually. Based on the Sanitas prediction limit output summarized in Attachment 2 of the Spring and Fall 2023 statistical evaluations, a total of 252 well/constituent pairs resulted for the upper bedrock, and 164 well/constituent pairs for the deeper bedrock, totaling 416 well/ constituent pairs annually for the site.

The cumulative annual SWFPR can be approximated directly from the α-levels reported in the Sanitas output as SWFPR $= 1 - \prod_{i=1}^{416}(1 - \alpha_i) = 0.279 \approx 28\%$. The current annual SWFPR is higher than the Unified Guidance target 10% false positive rate due to moving from a 1-of-3 to the 1-of-2 prediction plan starting with the Spring 2021 statistical evaluation and the relatively large number of downgradient comparisons with nonparametric prediction limits. Given the number of non-parametric prediction limit evaluations, a background sample size of approximately 80-90 is needed to reduce the SWFPR once again to the 10% target level.

Narrative

Job Narrative
310-269165-1

Analytical test results meet all requirements of the associated regulatory program listed on the Accreditation/Certification Summary Page unless otherwise noted under the individual analysis. Data qualifiers are applied to indicate exceptions. Noncompliant quality control (QC) is further explained in narrative comments.

Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD may be performed, unless otherwise specified in the method.
Surrogate and/or isotope dilution analyte recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in the narrative.

Regulated compliance samples (e.g. SDWA, NPDES) must comply with the associated agency requirements/permits.

Receipt
The sample was received on 11/8/2023 3:40 PM. Unless otherwise noted below, the sample arrived in good condition, and, where required, properly preserved and on ice. The temperature of the cooler at receipt time was 3.4°C

GC/MS VOA
Method 8260D: The continuing calibration verification (CCV) associated with batch 310-405662 recovered above the upper control limit for Trichloroethene (21.0 %D). The laboratory control sample (LCS) associated with this CCV were within CCV criteria for the affected analytes; therefore, the data have been reported. The associated sample is impacted: (CCV 310-405662/4).

Method 8260D: The continuing calibration verification (CCV) associated with batch 310-405662 recovered above the upper control limit for Trichlorofluoromethane (29.3 %D). The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported. The associated sample is impacted: (CCV 310-405662/3).

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

GC/MS Semi VOA
Method 8270E: The continuing calibration verification (CCV) associated with batch 310-405957 recovered above the upper control limit for Hexachlorocyclopentadiene (40.9%D) and 2-Nitrophenol (24.0%D). The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported.

Method 8270E: The laboratory control sample (LCS) and / or laboratory control sample duplicate (LCSD) for preparation batch 310-405356 and analytical batch 310-405957 recovered outside control limits for the following analytes: Pyridine.

Method 8270E: The RPD of the laboratory control sample (LCS) and laboratory control sample duplicate (LCSD) for preparation batch 310-405356 and analytical batch 310-405957 recovered outside control limits for the following analytes: 2-Chloroaniline and Pyridine.

Method 8270E: The continuing calibration verification (CCV) associated with batch 310-405954 recovered above the upper control limit for Methyl parathion (26.3%D), Ethyl Parathion (21.4%D), o,o',o''-Triethylphosphorothioate (22.3%D), 1,3,5-Trinitrobenzene (61.6%D), Kepone (95.5%D), Hexachloropropene (43.8%D), Chlorobenzilate (41.2%D) and Dinoseb (122%D). The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported.

Method 8270E: The laboratory control sample (LCS) for preparation batch 310-405356 and analytical batch 310-405954 recovered outside control limits for the following analytes: Famphur, Kepone, 1,3,5-Trinitrobenzene, Dinoseb and 2-Nitrophenol. These analytes were biased high in the LCS and were not detected in the associated samples; therefore, the data have been reported.

Method 8270E: The laboratory control sample and/or the laboratory control sample duplicate (LCS/LCSD) for preparation batch 310-405356 and analytical batch 310-405954 recovered outside control limits for the following analyte(s): 3,3'-Dimethylbenzidine, p-Phenylene diamine and Methapyrilene. 3,3'-Dimethylbenzidine, p-Phenylene diamine and Methapyrilene have been identified as poor performing analytes when analyzed using this method; therefore, re-extraction/re-analysis was not performed

Job ID: 310-269165-1 (Continued)

Laboratory: Eurofins Cedar Falls (Continued)

Method 8270E: The laboratory control sample duplicate (LCSD) for preparation batch 310-405356 and analytical batch 310-405954 recovered outside control limits for the following analytes: Famphur, Kepone, 4-Aminobiphenyl, 1,3,5-Trinitrobenzene and Dinoseb. These analytes were biased high in the LCSD and were not detected in the associated samples; therefore, the data have been reported.

Method 8270E: The RPD of the laboratory control sample (LCS) and laboratory control sample duplicate (LCSD) for preparation batch 310-405356 and analytical batch 310-405954 recovered outside control limits for the following analytes: 2-Naphthylamine and Hexachloropropene.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Herbicides

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

PCBs

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Pesticides

Method 8081B: The continuing calibration verification (CCV) associated with batch 310-405682 recovered above the upper control limit for Methoxychlor. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

HPLC/IC

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Metals

Method 6020B: The reference method requires samples to be preserved to a pH of <2. The following sample was received with insufficient preservation at a pH of >2: Site 1_Leachate_23_11 (310-269165-1). The sample(s) was preserved to the appropriate pH in the laboratory.

Method 7470A: The reference method requires samples to be preserved to a pH of <2. The following sample was received with insufficient preservation at a pH of >2: Site 1_Leachate_23_11 (310-269165-1). The sample(s) was preserved to the appropriate pH in the laboratory.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

General Chemistry

Method SM5210B_Calc: All the dilutions failed to deplete the method-required 2 mgO2/L for the following samples: Site 1_Leachate_23_11 (310-269165-1). Only a "less than" result could be calculated from the least dilute preparation.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
F1	MS and/or MSD recovery exceeds control limits.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

GC/MS Semi VOA

Qualifier	Qualifier Description
*-	LCS and/or LCSD is outside acceptance limits, low biased.
*+	LCS and/or LCSD is outside acceptance limits, high biased.
*1	LCS/LCSD RPD exceeds control limits.
E	Result exceeded calibration range.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

General Chemistry

Qualifier	Qualifier Description
E	Result exceeded calibration range.
F1	MS and/or MSD recovery exceeds control limits.
HF	Parameter with a holding time of 15 minutes. Test performed by laboratory at client's request. Sample was analyzed outside of hold time.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Accreditation/Certification Summary

Client: Foth Infrastructure & Environment, LLC
Job ID: 310-269165-1
Project/Site: Site 1 Leachate

Laboratory: Eurofins Cedar Falls

Unless otherwise noted, all analytes for this laboratory were covered under each accreditation/certification below.

Authority	Program	Identification Number	Expiration Date
Iowa	State	007	12-01-23

The following analytes are included in this report, but the laboratory is not certified by the governing authority. This list may include analytes for which the agency does not offer certification.

Analysis Method	Prep Method	Matrix	Analyte
2540E		Water	Fixed Solids
365.1	365.2/365.3/365	Water	Phosphorus as PO4
8260D		Water	1,2,3-Trichlorobenzene
8260D		Water	1,2,4-Trichlorobenzene
8260D		Water	2-Chloroethyl vinyl ether
8260D		Water	Bromobenzene
8260D		Water	Hexane
8260D		Water	p-Isopropyltoluene
8260D		Water	sec-Butylbenzene
8260D		Water	tert-Butylbenzene
8270E	3510C	Water	Benzoic acid
8270E	3510C	Water	Pyridine

Laboratory: Eurofins Savannah

All accreditations/certifications held by this laboratory are listed. Not all accreditations/certifications are applicable to this report.

Cooler/Sample Receipt and Temperature Log Form

Client Information

Client: Foth

City/State: CITY | STATE | Project:

Receipt Information

Date/Time Received: DATE 11/8/23 | TIME 1540 | Received By: EM

Delivery Type: ☐ UPS ☐ FedEx ☐ FedEx Ground ☐ US Mail ☐ Spee-Dee
☒ Lab Courier ☐ Lab Field Services ☐ Client Drop-off ☐ Other:_____

Condition of Cooler/Containers

Sample(s) received in Cooler?	☒ Yes	☐ No	*If yes:* Cooler ID:
Multiple Coolers?	☐ Yes	☒ No	*If yes:* Cooler # _____ of _____
Cooler Custody Seals Present? No	☒ Yes	☐ No	*If yes:* Cooler custody seals intact? ☒ Yes ☐ No
Sample Custody Seals Present? No	☐ Yes	☒ No	*If yes:* Sample custody seals intact? ☐ Yes ☐ No
Trip Blank Present?	☐ Yes	☒ No	*If yes:* Which VOA samples are in cooler? ↓

Temperature Record

Coolant: ☒ Wet ice ☐ Blue ice ☐ Dry ice ☐ Other:_____ ☐ NONE

Thermometer ID: X | Correction Factor (°C): 0

Temp Blank Temperature – If no temp blank, or temp blank temperature above criteria, proceed to Sample Container Temperature

Uncorrected Temp (°C): 3.4 | Corrected Temp (°C): 3.4

Sample Container Temperature

	CONTAINER 1	CONTAINER 2
Container(s) used:		
Uncorrected Temp (°C):		
Corrected Temp (°C):		

Exceptions Noted

1) If temperature exceeds criteria, was sample(s) received same day of sampling? ☐ Yes ☐ No
   a) *If yes:* Is there evidence that the chilling process began? ☐ Yes ☐ No

2) If temperature is <0°C, are there obvious signs that the integrity of sample containers is compromised? (e.g., bulging septa, broken/cracked bottles, frozen solid?) ☐ Yes ☐ No

NOTE: If yes, contact PM before proceeding. If no, proceed with login

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	N/A	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A
