Re: 2023 Annual Water Quality Report
Cedar Rapids Linn County Solid Waste Agency Site 1
2250 A Street SW, Cedar Rapids, IA 52404
Permit No. 57-SDP-03-75C

Dear Brian Rath:

On behalf of the Cedar Rapids Linn County Solid Waste Agency (Agency), Foth Infrastructure & Environment, LLC (Foth) is submitting the 2023 Annual Water Quality Report (AWQR) as required by Iowa Department of Natural Resources (IDNR) Permit No. 57-SDP-03-75C. The contents of this report are intended to satisfy the requirements of 567 Iowa Administrative Code (IAC) 113.10(5)c(1) and 113.10(6)d(1), related to recordkeeping and notification, and annual reporting requirements listed in IAC 113.10(10) (effective 12/10/07).

This report was prepared using the IDNR AWQR report format required by Permit Amendment #14. The Monitoring Well Maintenance and Performance Reevaluation Schedule and Summary, Leachate Control System Performance Evaluation Report (LCSPER), and Methane Monitoring Report (MMR) have been incorporated directly into the AWQR as Tables 3, 4, 11, 12, and 13.

Thank you for your attention to this matter. Please contact us at our numbers listed below if you have any questions or need additional information.

Sincerely,

Foth Infrastructure & Environment, LLC

Hannah Dubbs
Project Environmental Scientist

Certifications

I hereby certify that this document was prepared by me or under my direct supervision and that I am a qualified groundwater scientist as defined in 567 Iowa Administrative Code 113.10(1)d.

1/31/2024
Gina Wilming (date)
Iowa G.W.P. No. 2099.

My certification renewal date is
December 31, 2025.

For the purposes of 567 Iowa Administrative Code 113.10(1)d, a "qualified groundwater scientist" means a scientist or an engineer who has received a baccalaureate or postgraduate degree in the natural sciences or engineering and has sufficient training and experience in groundwater hydrology and related fields demonstrated by state registration, professional certifications, or completion of accredited university programs that enable that individual to make sound professional judgments regarding groundwater monitoring, contaminant fate and transport, and corrective action.

LICENSED PROFESSIONAL ENGINEER BRIAN K. HARTHUN 14049 IOWA	I hereby certify that the Leachate Control System Performance Evaluation Report and Methane Monitoring Report were prepared by me or under my direct personal supervision and that I am a duly licensed Professional Engineer under the laws of the State of Iowa. 1/31/2023 Brian K. Harthun (date) Iowa P.E. No. 14049 My license renewal date is December 31, 2024. Pages or sheets covered by this seal: Tables 11, 12, and 13

1. Executive Summary

Foth Infrastructure & Environment, LLC (Foth) was retained by the Cedar Rapids Linn County Solid Waste Agency (Agency) to provide an annual report summarizing the groundwater quality and hydrogeologic monitoring activities at Site 1 during 2023. This 2023 Annual Water Quality Report (AWQR) was prepared using the Iowa Department of Natural Resources (IDNR) AWQR report format required by Permit Amendment #14. The Monitoring Well Maintenance and Performance Reevaluation Schedule and Summary, Leachate Control System Performance Evaluation Report (LCSPER), and Methane Monitoring Report (MMR) have been incorporated directly into the AWQR as Tables 3, 4, 11, 12, and 13.

1.1 Period of Report Coverage

This AWQR presents an evaluation of the groundwater, methane monitoring, and leachate collection system monitoring, maintenance, and performance activities conducted at Site 1 for the period of January 1 through December 31, 2023.

1.2 Report Priority

No actions or activities are on hold due to the completion of IDNR review or comment. There are no changes to the Hydrologic Monitoring System Plan (HMSP) requested in this report.

Foth requests IDNR review and approval of the following:

- Amend Permit Special Provision X.10 and the leachate monitoring network by replacing W-212 with W-214 and removing W-217, as requested in Table 12 of this AWQR. Replacement of W-212 with W-214 will maintain adequate coverage since W-214 is located approximately 400 feet east of W-212 and will continue to monitor leachate elevations along the mid-central portion of the north side of Site 1. Removal of W-217 is recommended since it cannot be repaired or replaced at the same location, and there are no suitable replacement locations to provide coverage near the top of the landfill due to the construction and demolition debris filled there.

1.3 Site Status and Applicable Rules

Site 1 is a closed, unlined landfill located within the city limits of Cedar Rapids, Iowa. The facility is situated in Sections 27 and 34, Township 83 North, Range 7 West, in Linn County, Iowa. The landfill is situated in a former limestone and dolomite quarry adjacent to a horseshoe bend in the Cedar River. Land use in the area is urban, with nearby industrial, commercial, and residential uses. A site map depicting the characteristics of the landfill and surrounding vicinity is provided in Figure 1.

The facility includes about 95 acres, of which 76 acres have received fill materials. The waste is estimated to be 200 feet in thickness over the central portions of the disposal area and about 25 to 40 feet in thickness along its margins. The facility ceased operation on July 29, 2006. The rules in effect at the time of closure [567 Iowa Administrative Code (IAC) 113.26] were established on January 15, 2003. The closure permit (57-SDP-03-75C) was issued on September 21, 2006, and expires on September 21, 2036.

Groundwater monitoring and reporting activities were conducted in accordance with Special Provision X.6 of the closure permit (including subsequent permit amendments) and a combination of the rules in effect at the time of closure [567 IAC 113.26 (effective 1/15/03)] and the current rules (567 IAC 113.10). Details regarding the statistical methods utilized are included with the statistical reports in Appendix B. In accordance with Permit Amendment #4 and the variance granted on March 26, 2010, monitoring well maintenance and performance was conducted in accordance with 567 IAC 113.10(2)f rather than the rules in effect at the time of closure.

Methane monitoring and reporting activities were conducted in accordance with Special Provision X.8 and 567 IAC 113.26(15)b (effective 1/15/03).

The leachate collection system monitoring, maintenance, and performance activities were conducted in accordance with Special Provision X.10 and 567 IAC 113.26(8)d (effective 1/15/03).

2. Site Background

2.1 Site History

Site 1 began operations in 1965 as an unlined landfill and was first permitted by the State of Iowa in 1975. From 1975 to July 29, 2006, the landfill operated under Sanitary Disposal Project Permit No. 57-SDP-03-75P and received municipal waste generated from residential, commercial, and industrial generators located primarily in Cedar Rapids and Linn County.

The facility ceased operation on July 29, 2006 and construction of the final cap was completed in 2007. The closure permit (57-SDP-03-75C) was issued on September 21, 2006.

In June 2008, the landfill reopened for disposal of disaster debris from the 2008 flooding (in accordance with Permit Amendment #2) and continued to accept debris until Spring 2013 (in accordance with Permit Amendment #5). The facility ceased operation in Spring 2013 and began reconstruction of the final cover. Construction of the final cover was completed in August 2013 and incorporated into the closure permit through Permit Amendment #9.

2.2 Geology and Hydrogeology

The site-specific geologic and hydrogeologic characteristics presented in this section are summarized from the November 1992 *Hydrogeologic Investigation Report* submitted by Howard R. Green Company (HRG, 1992).

The Site 1 landfill is situated within a limestone and dolomite quarry known as the former Otis quarry. The landfill is bounded to the north and east by the Cedar River and to the south and west by residential and commercial areas. The Otis quarry was developed in the Devonian age Otis Formation which is primarily composed of dolomite. Overburden at the landfill consists of quarry spoils, refuse, imported earth cover, Pleistocene glacial drift deposits, and Quaternary alluvium/colluvium.

The surficial stratigraphy is dominated by up to 47 feet of Cedar River alluvium. Along the eastern and northern landfill perimeters (closest to the Cedar River), alluvium directly overlies bedrock. In contrast, glacial till separates overlying alluvium from underlying pre-Wisconsin silt and sand and bedrock along the southern and western perimeters. The alluvium predominantly consists of silt and sand; however, localized zones of clay-rich alluvium are noted. A sand interval of up to 22 feet in thickness occurs in the alluvial sequence along the eastern perimeter of the landfill. Localized, thin remnants of sand-rich glacial till are also noted and appear to attain a maximum thickness of approximately 17 feet in the west-central area of the landfill.

Composed primarily of limestone and dolomite, the bedrock surface spans the Silurian age Gower Formation, the Coggon Member of the Devonian age Otis Formation, the Cedar Rapids Member of the Devonian age Otis Formation, and the Kenwood Member of the Devonian age Wapsipinicon Formation (from oldest to most recent). In the south-central portion of the landfill, where quarry excavations were the deepest, the bedrock surface consists of the Coggon Member of the Devonian age Otis Formation. The Cedar Rapids Member of the Devonian age Otis Formation is encountered in areas of the landfill where pre-landfill quarry excavations were not as deep. The Devonian age Wapsipinicon Formation is present along the landfill periphery in the south-central and north-central portions of the facility.

Two aquifers exist at Site 1: the shallow Cedar River alluvium aquifer and the Devonian-Silurian bedrock aquifer. The two aquifers exist under unconfined conditions and are hydraulically connected forming a single aquifer system which is in hydraulic connection with the Cedar River. During the hydrogeologic investigation, the water table was observed within the alluvium at only two well locations: MW-17 and MW-34. Generally, the alluvial sequence is considered relatively impermeable; however, where saturated, this sequence is hydraulically connected to the underlying bedrock aquifer and the Cedar River.

In all other locations, the water table was encountered within the bedrock aquifer, most typically in the weathered and fractured Coggon Member of the Otis Formation. Hydraulic conductivity typically ranged from $2.7x10^{-8}$ to $6.6x10^{-5}$ centimeters per second (cm/s) where the Coggon Member was not fractured or highly weathered. A hydraulic conductivity range on the order of 10^{-2} cm/s or greater was inferred for the weathered and fractured Coggon Member of the Otis Formation. Hydraulic conductivity ranged from $8.1x10^{-8}$ to $8.1x10^{-7}$ cm/s and $4.0x10^{-7}$ to $2.3x10^{-3}$ cm/s for the Cedar Rapids Member of the Otis Formation and the Silurian age Gower Formation, respectively. Again, values for weathered or fractured zones in these formations are presumed to be on the order of 10^{-2} cm/s or greater.

Groundwater levels measured in monitoring wells installed around the periphery of the landfill are consistent with the regional north-northeast groundwater flow direction toward the Cedar River. The horizontal water table gradient varied from 0.0015 feet per foot (ft/ft) to 0.1671 ft/ft, with an average gradient of 0.0281 ft/ft. The vertical recharge gradient ranged from 0.0007 ft/ft to 0.0447 ft/ft, with an average recharge gradient of 0.0112 ft/ft. The vertical discharge gradient ranged from 0.0005 to 0.0075 ft/ft, with an average discharge gradient of 0.0033 ft/ft. The horizontal gradient is approximately 2.5 times greater than the vertical recharge gradient and 8.5 times greater than the vertical discharge gradient. On average, groundwater flow is dominated by the horizontal flow component.

2.3 History of Groundwater Corrective Action

Groundwater quality assessments were conducted during 1998-2001 in response to a release of leachate. The leachate release was characterized by concentrations above the applicable health-based risk levels for 1,2-dichloroethane, 1,2-dichloropropane, dissolved arsenic, benzene, cadmium, cis-1,2-dichloroethene, nitrogen as ammonia, tetrachloroethene, trichloroethene, vinyl chloride, and dissolved zinc in the upper bedrock system and 1,2-dichloroethane, dissolved arsenic, benzene, tetrachloroethene, nitrogen as ammonia, vinyl chloride, and dissolved zinc in the deeper bedrock system. The groundwater quality assessment work was conducted in accordance with the rules in effect at the time [IAC 103.2(9)]. The reports summarizing the previously approved groundwater assessments are:

- *Groundwater Quality Assessment: Work Plan* (HRG, 1998)
- *Groundwater Quality Assessment: Final Phase I Report* (HRG, 1999)
- *Phase II Groundwater Quality Assessment Expanded Risk Assessment Documentation* (HRG, 2000)
- *Phase II Groundwater Quality Assessment Report, Volumes I & II* (HRG, 2001)

In accordance with the rules in effect at the time [IAC 103.2(9)], the selected remedy was outlined in the Risk Management Plan and Corrective Action Plan (HRG, 2001) which was approved by the IDNR and incorporated into the closure permit through Special Provision X.7. To date, remedy implementation has been conducted in accordance with the Risk Management Plan and Corrective Action Plan (HRG, 2001).

Prior to August 2008, semiannual groundwater sampling for the routine and supplemental indicator parameters was conducted in accordance with the previous rule revisions listed in IAC 113.26(15) (effective 1/15/03) and the Risk Management Plan and Corrective Action Plan (HRG, 2001). In accordance with the 2007 rule revisions, assessment monitoring for the Appendix II constituents [IAC 113.10(6)] was initiated in August 2008 due to indicator parameter control limit exceedances identified after the March 2008 sampling event (Foth, 2008). The initial Appendix II statistical evaluation identified statistically significant levels (SSLs) over the groundwater protection standards (GWPS) in the upper bedrock system (Foth, 2010a). In lieu of initiating assessment of corrective measures (ACM) under IAC 113.10(7), the *2010 AWQR* and *March 2011 Semiannual Report* (Foth, 2010b and 2011) requested IDNR review of the previous groundwater quality assessment activities and continued implementation of the Risk Management Plan and Corrective Action Plan.

In the letter dated June 27, 2011 (IDNR, 2011), IDNR provided written concurrence that the requirements outlined in IAC 113.10(7) do not need to be repeated when previously identified contaminants are found to exceed a GWPS. However, IDNR required the Agency to conduct additional delineation activities and to submit a schedule for completing the existing remedy which demonstrates how and/or when the existing remedy will meet the following performance objectives: 1) be protective of human health and the

environment, 2) attain the GWPS, 3) control the source of the release or eliminate to the maximum extent practicable to prevent further releases, and 4) comply with the standards for management of wastes.

An *Assessment Work Plan* (Foth, 2012) was prepared to outline additional activities for expansion of the background data set, for addressing horizontal and vertical delineation, and a schedule for completing a comprehensive data review (i.e., trend analysis, plume stability) to evaluate the existing remedy and determine a schedule for achieving compliance with the performance objectives. In accordance with the approved *Assessment Work Plan* (Foth, 2012), additional background and delineation monitoring wells were installed and sampled between May 2013 and September 2014. An evaluation of the effectiveness of the existing remedy and compliance with the performance requirements was submitted with the *2014 AWQR* (Foth, 2015a). The conclusions of the data evaluation recommended continued implementation of the existing remedy as outlined in the Risk Management Plan and Corrective Action Plan (HRG, 2001).

In the March 10, 2015 comment letter (IDNR, 2015), the IDNR did not yet concur with the recommendation to continue implementation of the existing remedy. IDNR requested further plume delineation but indicated that if low-flow sampling were initiated, then additional plume delineation activities could be deferred until analysis of the new data is complete.

In accordance with the *Response to DNR Comments dated March 10, 2015* letter (Foth, 2015b), a low-flow sampling and analysis program was implemented between Spring 2015 and Fall 2016. Reevaluation of the background and downgradient data sets based on the sampling methodology change was conducted during the Fall 2016 statistical evaluation. Recommendations were provided in the *Fall 2016 Statistical Notifications* letter (Foth, 2016a) and the *2016 AWQR* (Foth, 2016b). IDNR approved the recommended background and downgradient data set adjustments in the letter dated November 20, 2017 (IDNR, 2017).

Upon completion of the low-flow sampling and analysis program and reevaluation of the background and downgradient data sets, two-dimensional plume stability models were utilized to evaluate horizontal and vertical plume delineation (Foth, 2017). The results indicated that compliance with the horizontal and vertical delineation requirements have been met for nickel, thallium, and vinyl chloride. However, compliance has not been met for arsenic and cobalt. Two additional well nests (MW-108A/B and MW-109A/B) were recommended in a continued effort to meet the delineation requirements for arsenic and cobalt.

In accordance with the *Plume Delineation [IAC 113.10(6)g(1)1]* letter (Foth, 2017), upper and deeper bedrock delineation monitoring wells MW-108A, MW-108B, and MW-109A, and MW-109B were installed in November 2017 to horizontally and vertically delineate the arsenic and cobalt groundwater plumes in accordance with IAC 113.10(6)g(1)1. Delineation wells MW-108A, MW-108B, MW-109A, and MW-109B were installed in November 2017. Five rounds of baseline delineation monitoring for the Appendix I list were conducted between November 2017 and November 2018 at these locations.

In the letter dated November 20, 2017 (IDNR, 2017), IDNR commented that reevaluation of the existing source control and remedy should be conducted after review of the 2017 AWQR and a meeting with IDNR, the Agency, and the Agency's consultant has been completed. A meeting was held between IDNR, the Agency, and Foth on April 19, 2018. The meeting included a history of groundwater compliance activities at Site 1, an update on delineation progress, and discussions regarding property owner notification, remedy evaluation and implementation, and whether any post-closure care reductions could be considered (i.e., sampling optimization).

Based on the discussions and verbal approvals at the April 19, 2018 meeting, a reevaluation of the existing remedy and source control was provided in the *2018 AWQR* (Foth, 2019a). No additional delineation activities were recommended and IDNR approval to finalize completion of delineation activities at Site 1 was requested. Reevaluation of exposure pathways and receptors did not identify any new receptors and indicated that the previous risk assessment remained applicable. Reevaluation of source control suggested that the identified decrease in the number of contaminants comprising the groundwater plume along with steady to declining groundwater concentrations indicated that the leachate release is under control. In addition, steady to declining leachate elevations with no apparent

correlation with precipitation supported that construction of the final cover and additional storm water controls has been effective in reducing infiltration. Based on the reevaluation results, IDNR approval to continue implementation of the existing remedy in accordance with the Risk Management Plan (HRG, 2001) was requested, along with IDNR approval of the revised remedy implementation schedule based on a monitored natural attenuation (MNA) remedy as outlined in Section 4.3 of the *2018 AWQR* (Foth, 2019a).

In the letter dated April 16, 2019, IDNR approved the revised remedy implementation schedule as shown in Section 4.3 of the *2018 AWQR* (Foth, 2019a), except for removal of MW-109B from the groundwater monitoring network (IDNR, 2019). MW-109B has been retained in the monitoring network.

In 2019, the Agency elected to hold a Public Information Meeting to provide the public an opportunity to learn more about the closed Site 1 landfill and to re-notify interested parties and property owners that directly overlie the groundwater plume. The 2019 notifications were a continuation of the historical public notification efforts regarding groundwater quality near the closed Site 1 landfill. Initial public notification was conducted through a press conference and two public meetings held in February 1998. The Agency elected to re-notify property owners that directly overlie the groundwater plume due to the length of time that had passed since the initial 1998 notifications and to be transparent. The Public Informational Meeting was held on October 17, 2019 at the National Czech & Slovak Museum & Library from 5:30 – 7:30 PM. IDNR was provided notice of the Public Informational Meeting, a figure depicting the overall extent of the groundwater plume at Site 1, a listing of property owners that were notified, and copies of the notification letters in the submittal dated October 7, 2019 (Foth, 2019b).

In July 2020, the IDNR approved the spatial and frequency optimizations detailed in "Site 1 Monitoring Optimization" (Foth, 2020) in the Permit Amendment #16 (IDNR, 2020). The spatial optimization recommendations were initiated in Fall 2020, and the frequency optimizations were initiated in Spring 2021. The Monitoring Program Implementation Schedule provided as Table 2 includes the approved spatial and frequency optimizations.

3. Quality Assurance/Quality Control Summary

In 2023, field blanks, field duplicates, and trip blanks were collected and analyzed at the frequencies listed in the *Hydrologic Monitoring System Plan* (HRG, 2006). Data validation reports detailing any resampling, data qualifiers added per data validation, and an overall assessment of the data are included in Appendix A.

In 2023, the overall data assessments indicated that method criteria, precision, accuracy, representativeness, comparability, completeness, and suitability for intended use were acceptable. In 2023, resampling was not conducted; however, it was considered based on the data quality for the Winter and Fall 2023 sampling events.

In Winter 2023, 1,4-phenylenediamine in MW-26 was rejected due to laboratory control sample/laboratory control sample duplicate recoveries that were below the recovery limit. Therefore, the January 2023 1,4-phenlyenediamine (i.e., p-phenylenediamine) result for MW-26 is crossed-out in Table 14. Resampling was not recommended for the rejected 1,4-phenylenediamine datum since 1,4-phenylenediamine was sampled and analyzed at MW-26 in January 2023 as part of the re-triggered quarterly baseline assessment monitoring for the full Appendix II list, this parameter has not been detected at MW-26, and 1,4-phenylenediamine would be included in the second quarterly baseline assessment monitoring event. In Spring 2023, no quality control issues impacted 1,4-phenylenediamine in MW-26, and 1,4-phenlyenediamine was not detected in MW-26.

In Fall 2023, the laboratory inadvertently omitted the acid semivolatile organic compounds for field blank sample FB-2 during the extraction process. The laboratory contacted Foth, and Foth instructed Eurofins not to re-prep FB-2 since it would be outside of hold time. Base/neutral semivolatile organic compounds were prepped and analyzed within hold times and reported. Resampling was not recommended because FB-2 is a quality control sample.

Overall, the 2023 data was found to be of good quality and suitable for the intended use, with the exception of rejected datum.

3.1 Sample Turbidity

Low-flow and no purge sampling techniques were continued in 2023. The sampling methodology utilized was consistent with minimizing turbidity and total suspended solids (TSS) in the groundwater samples. However, in Spring 2023, data set adjustments were recommended based on sample turbidity in background.

At upper bedrock background well MW-101A, the March 2023 TSS concentration of 12.6 mg/L slightly exceeded the 5 mg/L limit for acceptable sample quality. Barium, cadmium, cobalt, copper, nickel, selenium, and vanadium were detected above the method detection limit at MW-101A. Removal of these detected results at MW-101A was recommended since the March 2023 concentrations were above the range of historic concentrations and/or some TSS correlation was evident. The March 2023 barium, cadmium, cobalt, copper, nickel, selenium, and vanadium concentrations at MW-101A are crossed-out in Table 14.

Conversely, upper bedrock background well MW-37, and deeper bedrock background wells MW-38 and MW-101B had TSS concentrations below the 5 milligrams per liter (mg/L) level for satisfactory sample quality in 2023. The 2023 background review indicated that turbidity is not impacting the representativeness of the background data set, and the 2023 background data is suitable for use in interwell statistical comparisons.

Several downgradient and delineation monitoring wells had TSS concentrations greater than the 5 mg/L level for satisfactory sample quality. The IDNR noted in the Unnumbered Permit Amendment (IDNR, 2014) that a TSS level of 5 mg/L may be unattainable and concluded that if extra measures were conducted, the IDNR would consider higher levels for TSS as satisfactory. No additional actions or removal of data were recommended for the downgradient and delineation monitoring wells in 2023. The following additional actions have been conducted to address turbidity: well redevelopment was conducted at wells with elevated TSS concentrations in August 2015 and low-flow or no purge sampling techniques have been utilized since the March 2015 sampling event.

Historical high-volume data at the downgradient wells continued to be reviewed on a case-by-case basis in 2023 to determine whether adjustments were recommended based on the change in sampling technique from high volume to low-flow methods. IDNR concurred with the strategy to evaluate downgradient wells on a case-by-case basis given the large number of wells and volume of data in the letter dated November 20, 2017 (IDNR, 2017). No data set adjustments were recommended for the downgradient wells in 2023.

4. Conclusions and Recommendations

4.1 2023 Data Evaluation Summary

4.1.1 Groundwater

Quarterly baseline assessment monitoring was reinitiated at MW-26 in January and March 2023. No new Appendix II constituents were detected during the two rounds of quarterly re-triggered baseline assessment monitoring events at MW-26; therefore, no additional quarterly baseline assessment monitoring events were recommended. In addition, no new constituents were added to the detected Appendix II constituents during annual assessment monitoring events for the Appendix I and detected Appendix II constituents.

Based on the 2023 data, groundwater quality generally indicates stable or declining plumes. No new upper and deeper bedrock assessment monitoring locations, assessment constituents in corrective action monitoring locations, and assessment constituents in delineation monitoring locations triggered corrective action.

One corrective action constituent/well pair exited corrective action in 2023. In accordance with IAC 113.10(9)e(2), arsenic in MW-20 exited corrective action and returned to an assessment constituent in Spring 2023. In addition, compliance with the GWPS was maintained for cobalt in MW-35 in 2023. Compliance was first achieved for cobalt in MW-35 in Fall 2022; therefore, cobalt in MW-35 will return to an assessment constituent in 2025 as long as concentrations remain statistically below the GWPS during interim statistical evaluations.

Arsenic remains the most prevalent corrective action constituent with SSLs remaining above the GWPS in eleven of the upper bedrock corrective action and delineation monitoring wells and six of the deeper bedrock corrective action and delineation monitoring wells. Cobalt in AW-6, CRL-9, MW-22, MW-105A, MW-105B, MW-106A, and MW-109B; thallium in AW-2, MW-20, and MW-109B; and vinyl chloride in MW-34 also remain as SSLs above the GWPS. As shown in Table 10, stable or decreasing trends were identified for the corrective action constituents.

4.1.2 Leachate Control System Performance

Site operations and management practices have been consistent with the regulatory intent to achieve the lowest possible leachate head levels. The leachate collection system continues to function as designed, and monthly elevations are collected to monitor short-term and long-term trends in the leachate elevation data. In 2023, no significant change to the leachate contour pattern occurred, and the variation in elevations was not correlated with precipitation. Steady to declining leachate elevations were generally observed, which, along with no apparent correlation with precipitation, supports that construction of the final cover and additional stormwater controls appears to have been effective in reducing infiltration.

A review of the average annual leachate elevations indicates stable or declining elevations at W-100, W-102, W-104, W-105, W-110, W-115, W-117, W-203, W-207, W-209, W-211, W-212, and W-219. At W-103, a slightly increasing trend was identified from 2010 to 2023 with elevations increasing by approximately 7.5 feet during this period. The slope of the increasing trend has been decreasing over time. From 2021-2023, elevations have remained approximately stable.

At W-212, a casing restriction was encountered at 72.2 feet below top of casing (bTOC) in December 2023. As depicted in Figure 4, W-214 is an existing leachate piezometer located approximately 400 feet east of W-212. Replacement of W-212 with W-214 is recommended for monitoring leachate elevations along the mid-central portion of the north side of Site 1.

At W-217, a casing restriction was encountered at 63 feet bTOC starting in July and September 2022 and remained throughout 2023. As reported in the *2022 AWQR* (Foth, 2023), repair or replacement of W-217 is not recommended due to the presence of construction and demolition debris within the waste. W-217 is located near the top of the landfill in an area that was reopened and filled with disaster debris from the 2008 flood. Therefore, W-217 cannot be repaired or replaced at the same location. In addition, there are no suitable replacement locations to provide coverage near the top of the landfill due to the construction and demolition debris filled there. Surrounding W-217 at lower elevations, W-110, W-203, W-209, W-211, and W-219 provide good coverage below the top-central part of the landfill. Since leachate elevations remained below the restriction in 2023, the removal of W-217 from the leachate monitoring network is recommended.

4.1.3 Methane

The quarterly methane monitoring results did not indicate concentrations in exceedance of 25% of the lower explosive limit (LEL) for facility structures or 100% LEL for facility boundaries.

4.2 Recommendations for Future Monitoring

On behalf of the Agency, Foth presents the following recommendations for future monitoring at Site 1:

- Continue collecting water level and well depth measurements on a semiannual basis at the HMSP approved monitoring points.

- Continue collecting TSS samples and field turbidity measurements during sampling events in 2024.

- Continue detection, assessment, corrective action, background, and delineation monitoring as listed in Table 2.

- Continue MNA remedy implementation in accordance with the conditions set forth under Special Provision X.7 and the Risk Management Plan (HRG, 2001), and the IDNR-approved remedy implementation schedule. The updated remedy implementation schedule, reflecting the implementation actions planned, is provided in the table below.

Remedy Implementation Schedule

Estimated Completion Date	Activity
On-going – Semiannually or Annually	Continue implementation of the existing remedy in accordance with Special Provision X.7 and the Risk Management Plan (HRG, 2001).
	Continue semiannual or annual detection, assessment, and corrective action monitoring in accordance with IAC 113.10(5), (6), and (9)a and as listed in Table 2. Continue semiannual or annual delineation monitoring as listed in Table 2.
Annually (due January 31)	By January 31 of each year, submit AWQRs including an update on remedy implementation.
Every 5 years (Next due in 2024)	Conduct the five-year review cycle statistical procedures to determine whether first order attenuation can be projected for any of the corrective action constituents not previously estimated, and to review the first order attenuation model results and timeframes to ensure that actual conditions are meeting the modeled expectations for the corrective action constituents which have been projected.

Comments:

N/A = Not Applicable

[1] In Mar. and Aug. 2023, semiannual corrective action, background, and delineation monitoring were continued at upper bedrock wells MW-12, MW-13, MW-16, MW-17, MW-32, MW-37, and MW-101A and deeper bedrock wells MW-14, MW-33, MW-38, MW-101B, and MW-109B. In accordance with Permit Amendment #16, annual detection, assessment, corrective action, and delineation monitoring was also conducted in Aug. 2023 at upper bedrock wells AW-1, AW-2, AW-3, AW-4, AW-5, MW-20, MW-21, MW-23, MW-24, MW-26, MW-28, MW-30, MW-34, MW-35, VP-3, VP-4, MW-105A, MW-106A, MW-107A, and MW-109A and deeper bedrock wells AW-6, CRL-9, MW-11, MW-15, MW-18, MW-19, MW-22, MW-25, MW-31, MW-36, MW-102B, MW-104B, MW-105B, MW-107B, and MW-108B.

Table 2
Monitoring Program Implementation Schedule
2023 Annual Water Quality Report
Cedar Rapids Linn County Solid Waste Agency Site 1
Permit No. 57-SDP-03-75C

Comments (Continued):

(2) Appendix II locations were sampled for the Appendix I and detected Appendix II constituents in Mar. and Aug. 2023, and will be sampled for the Appendix I and detected Appendix II constituents in Spring and Fall 2024. In accordance with Permit Amendment #6, resampling for the full Appendix II list at assessment, corrective action, and background monitoring wells is conducted every five years.

(3) In accordance with IAC 113.10(6)a, two rounds of quarterly re-triggered baseline assessment monitoring for the full Appendix II list were conducted at MW-26 in Jan. and Mar. 2023. Annual assessment monitoring for the Appendix I and detected Appendix II constituents was conducted at MW-26 in Aug. 2023.

(4) The Iowa Department of Natural Resources (IDNR) approved retaining MW-104B as an arsenic delineation monitoring well in the letter dated May 12, 2016 (IDNR, 2016).

(5) The IDNR approved the removal of cobalt from the list of analytes at MW-108B in the letter dated April 16, 2019 (IDNR, 2019).

Table 3
Monitoring Well Maintenance and Performance Reevaluation Schedule
2023 Annual Water Quality Report
Cedar Rapids Linn County Solid Waste Agency Site 1
Permit No. 57-SDP-03-75C

Compliance with:	Monitoring Calendar Years									
	2015	2016	2017	2018	2019	2020	2021	2022	2023	2024
567 IAC 113.10(2)"f"(1): High and low water levels (semiannual)	Completed		Completed		Completed		Completed		Completed	
567 IAC 113.10(2)"f"(2): Changes in the hydrologic setting and flow paths	Completed		Completed		Completed		Completed		Completed	
567 IAC 113.10(2)"f"(3): Well depths	Completed	Completed	Completed	Completed	Completed	Completed	Completed	Completed	Completed	Scheduled
567 IAC 113.10(2)"f"(4)" Well recharge rates and chemistry	Completed		Completed		Completed		Completed		Completed	
567 IAC 113.6(2)"i": Waste separation from ground water	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A

Comments:

• In accordance with Permit Amendment #4 and the variance granted on March 26, 2010, monitoring well maintenance and performance is conducted in accordance with 567 IAC 113.10(2)"f" rather than the rules in effect at the time of closure.

• Groundwater elevations and measured well depths are shown on Table 4 and the field sampling forms in Appendix A.

• 567 IAC 113.6(2)"i" is not applicable. Site 1 is a closed, unlined landfill. The rules in effect at the time of closure were 567 IAC 113.26 (effective 1/15/03).

Table 4
Monitoring Well Maintenance and Performance Summary
2023 Annual Water Quality Report
Cedar Rapids Linn County Solid Waste Agency Site 1
Permit No. 57-SDP-03-75C

Comments Continued:

(1) MW-20 and MW-24 were replaced in 2005, but well construction forms could not be located on IDNR DocDNA. Constructed well depths were from the 2005 Annual Water Quality Report (AWQR) and Top of Screen (TOS) were estimated.

(2) MW-21 was replaced in 2005, but well construction form could not be located on IDNR DocDNA. Constructed well depth was from the 2005 AWQR and TOS was estimated. The constructed well depth was updated in Spring 2021 due to casing extension conducted as part of City of Cedar Rapids flood wall construction project.

Acceptability of Well Locations:

• In accordance with 567 IAC 113.10(2)f(1), a review of the horizontal and vertical acceptability of the approved monitoring points shall be conducted every two years. The horizontal placement of well locations remain acceptable. Site 1 is a closed landfill; therefore, the layout of the site has not changed since the last approval of the Hydrologic Monitoring System Plan (HMSP) in September 2006 (HRG, 2006). The horizontal placement of the existing monitoring wells, which are spaced roughly 400 to 600 feet apart around the entire landfill perimeter, continues to be acceptable. In addition, fourteen delineation monitoring wells (MW-102A through MW-109B) have been installed further downgradient of the HMSP wells in order to horizontally and vertically delineate SSIs and SSLs to background. Permit Amendment #16 approved the spatial and frequency optimizations detailed in "Site 1 Monitoring Optimization" (Foth, 2020). Spatial optimization recommendations were initiated in Fall 2020. The water table monitoring wells (i.e., upper bedrock monitoring wells) were not evaluated for removal due to their purpose of providing ongoing detection of releases from the closed landfill. As a result, horizontal acceptability of the groundwater monitoring network remained acceptable after spatial optimization. In addition, the purpose of the deeper bedrock monitoring wells was reviewed in "Site 1 Monitoring Optimization" (Foth, 2020). The review indicated that the upper bedrock wells are screened across or below the lowest elevation of the former quarry (and therefore, the lowest elevation of the unlined landfill), and any release from the landfill would be identified in the upper bedrock monitoring wells prior to horizontal or vertical migration. Therefore, the purpose of the deeper bedrock wells is for vertical delineation and not for identification of new releases. Based on this review, the deeper bedrock monitoring wells are not evaluated for horizontal acceptability.
• In 2022, AW-7 was inadvertently removed during the pavement removal activities for the Compost Facility Maintenance Shop project. AW-7 was an upper bedrock downgradient well used to delineate arsenic and cobalt. As detailed in the *2022 Annual Water Quality Report* (Foth, 2023), the removal of AW-7 does not significantly change the arsenic and cobalt plumes. As a result, removal of AW-7 from the HMSP was requested, and the IDNR approved the removal of AW-7 in Permit Amendment #19 (IDNR, 2023).
• In terms of vertical acceptability, the groundwater monitoring network includes wells completed within different intervals of the first water bearing zone. The water table is typically encountered in the surrounding alluvium and upper portion of the bedrock. Deeper bedrock wells monitor the same aquifer as the water table wells (upper bedrock), but at a depth that is 20 to 30 feet deeper.
• For the water table wells (upper bedrock), the 2022 and 2023 groundwater elevations were within the screened interval with the exception of AW-2, MW-17, MW-24, and VP-3. While AW-2, MW-17, MW-24, and VP-3 continually have submerged screens, these locations continue to provide representative information regarding local groundwater elevation and quality given that most elevations were only slightly above the screened interval, but within the filter pack interval, elevations were within the normal range of elevations at these locations (indicating no change in conditions), and/or proximity to the river attributed to the higher groundwater elevation.
• The remaining HMSP wells at the facility are deeper bedrock monitoring wells. These wells were originally installed as described under IAC 113.16(1) for the hydrogeologic study. The vertical placement of the deeper bedrock monitoring wells continues to be acceptable.
• The biennial evaluation indicates that the horizontal and vertical placement of the existing monitoring wells continues to be acceptable and no maintenance activities are recommended based on horizontal and vertical acceptability at this time.

Water Level Conditions:

• In accordance with IAC 113.10(2)f(2), a review of water level conditions must be conducted every two years to ensure that the effects of waste disposal or well operation have not resulted in changes in the hydrologic setting and resultant flow paths. The Mar. and Aug. 2022 water table contours are depicted in Figures 2 and 3 of the *2022 AWQR* (Foth, 2023), and the Mar. and Aug. 2023 water table contours are depicted in Figures 2 and 3 of the 2023 AWQR. These maps were prepared using water level measurements from the water table (upper bedrock) groundwater monitoring wells and liquid levels from the gas collection system wells. Examination of the water table configuration presented in Figures 2 and 3 of the *2022 AWQR* (Foth, 2023) and Figures 2 and 3 of the 2023 AWQR indicate that MW-37 and MW-38 remain upgradient and background wells MW-101A and MW-101B remain in an up- or cross-gradient direction. The groundwater flow direction is unchanged relative to previous reviews. Significant impacts or changes in groundwater hydrology or groundwater flow paths have not occurred.
• The groundwater fluctuations observed in 2022 and 2023 were similar to those observed during the 2021 water level condition evaluation. Locations that have historically had greater fluctuations have continued to have larger fluctuations due to their proximity to the Cedar River. On average, groundwater fluctuations were down due to consistent drought conditions in 2023.
• The biennial evaluation did not identify significant impacts or changes in groundwater hydrology or groundwater flow paths. No maintenance activities are recommended based on review of the 2022 and 2023 water level information.

Table 4
Monitoring Well Maintenance and Performance Summary
2023 Annual Water Quality Report
Cedar Rapids Linn County Solid Waste Agency Site 1
Permit No. 57-SDP-03-75C

Comments Continued:

Well Depths:

• In accordance with IAC 113.10(2)f(3), well depth measurements were collected in 2022 and 2023 to ensure the wells are physically intact and not filling with sediment. The 2022 and 2023 well depths are within one foot of the original well depths, except at MW-26, MW-30, and MW-35. The well depth measurements at these locations were between 1-2 feet deeper than the original well depths, which does not indicate that these wells are filling up with sediment. The discrepancies between the measured well depths and the original depths at MW-26, MW-30, and MW-35 are attributed to an error in the original boring log records for these wells.

• The 2022 and 2023 measured well depths indicated that the wells are not filling with sediment and remain physically intact. No maintenance activities are recommended based on review of the 2022 and 2023 well depth information.

Well Deterioration:

• In accordance with IAC 113.10(2)f(4), a review of well recharge rates and chemistry must be conducted every two years to determine if well deterioration is occurring. Review of the water level measurements prior to and subsequent to sampling indicated that recharge rates are consistent with historically observed data. The 2022 and 2023 field parameter results measured during purging are consistent with previously observed measurements.

• The well recharges rates and field chemistry data indicate the integrity of the monitoring wells remains intact and that no deterioration is occurring. Based on review of the well recharge rates and field chemistry, no maintenance activities are recommended.

Exterior Well Maintenance:

• The exterior condition of the monitoring wells was evaluated in Aug. 2022 and Aug. 2023. This inspection included: the physical surrounding, condition of the bumper posts, condition of the surface seal, condition of the outer protective casing, verifying wells are locked, condition of the well cap, presence of water in the annular space or around the exterior of the well, and obstructions or kinks in the well casing. Well maintenance was not recommended in 2022. Additional tree clearing work around the perimter of Site 1 was completed by J. Pettiecord Inc. between Oct. and Dec. 2022. The Aug. 2023 well maintenance evaluation indicated a need for the following maintenance: painting bumper posts, replacing padlocks, and repairing/replacing hinges of the outer protective casing. The maintenance activities will be conducted in 2023.

Proposed Changes to the Monitoring Network

• Based on the biennial review of water levels, well depths, horizontal and vertical acceptability of well locations, well recharge rates, and field chemistry, no well maintenance activities or additional monitoring wells are recommended at this time.

Table 5
Background and GWPS Summary
2023 Annual Water Quality Report
Cedar Rapids Linn County Solid Waste Agency Site 1
Permit No. 57-SDP-03-75C

Comments:

N/A = not applicable

RL = reporting limit taken as the laboratory practical quantitation limit (PQL)

(1) List contains constituents detected above the laboratory minimum detection limit (MDL) in the background data sets after data set adjustments detailed in the Appendix B statistical reports were conducted (i.e., removal of background data based on turbidity and elevated PQLs). Background data set adjustments are listed as crossed-out concentrations in Table 14 and were removed from the background data set prior to conducting statistical analyses.

(2) The number of detections includes J-flagged data (concentrations above the MDL but below the RL).

(3) Non-detect concentrations are included in the calculation of minimum, maximum, and mean; 1/2 the RL was utilized for non-detect concentrations.

(4) Sources are either the Maximum Contaminant Level promulgated under Section 1412 of the Safe Drinking Water Act in 40 CFR Part 141 (MCL) or the 567 IAC Chapter 137 Statewide Standards for a Protected Groundwater Source (SS). If background is higher than the MCL or SS, the GWPS is background. Background as the GWPS is both the *two-sample* test prediction limit method and the *one-sample* test confidence limit method where the fixed GWPS is the background upper tolerance limit with 95% confidence and 95% coverage. N/A = not applicable; constituent does not have a MCL or SS and using background as the GWPS is not applicable due to limited detections.

• The background data sets consist of MW-37 and MW-101A for upper bedrock and MW-38 and MW-101B for deeper bedrock. The Mar. 2023 detected metals in MW-101A were removed from the background data set since the March 2023 metal concentrations were above the range of historic concentrations and/or some TSS correlation was evident. The previous background data set adjustments detailed in the statistical reports provided in Appendix B and listed as crossed-out concentrations in Table 14 were maintained in 2023.

• No new constituents were detected at the upper and deeper bedrock locations in 2023.

Table 6
Summary of Well/Detected Constituent Pairs With No Previous SSIs
2023 Annual Water Quality Report
Cedar Rapids Linn County Solid Waste Agency Site 1
Permit No. 57-SDP-03-75C

Well	Constituent [1]	Units	Most Recent Result (Aug. 2023)	Background Standard [2]
Deeper Bedrock Monitoring Locations				
Detection Monitoring Locations				
MW-31	Barium	mg/L	0.0999	0.138
	Total Suspended Solids	mg/L	3	N/A

* of-2 retesting plan for groundwater prediction limits and DQR constituents).

** Current result is a confirmed SSI. Appendix II sampling will be completed within 90 days.

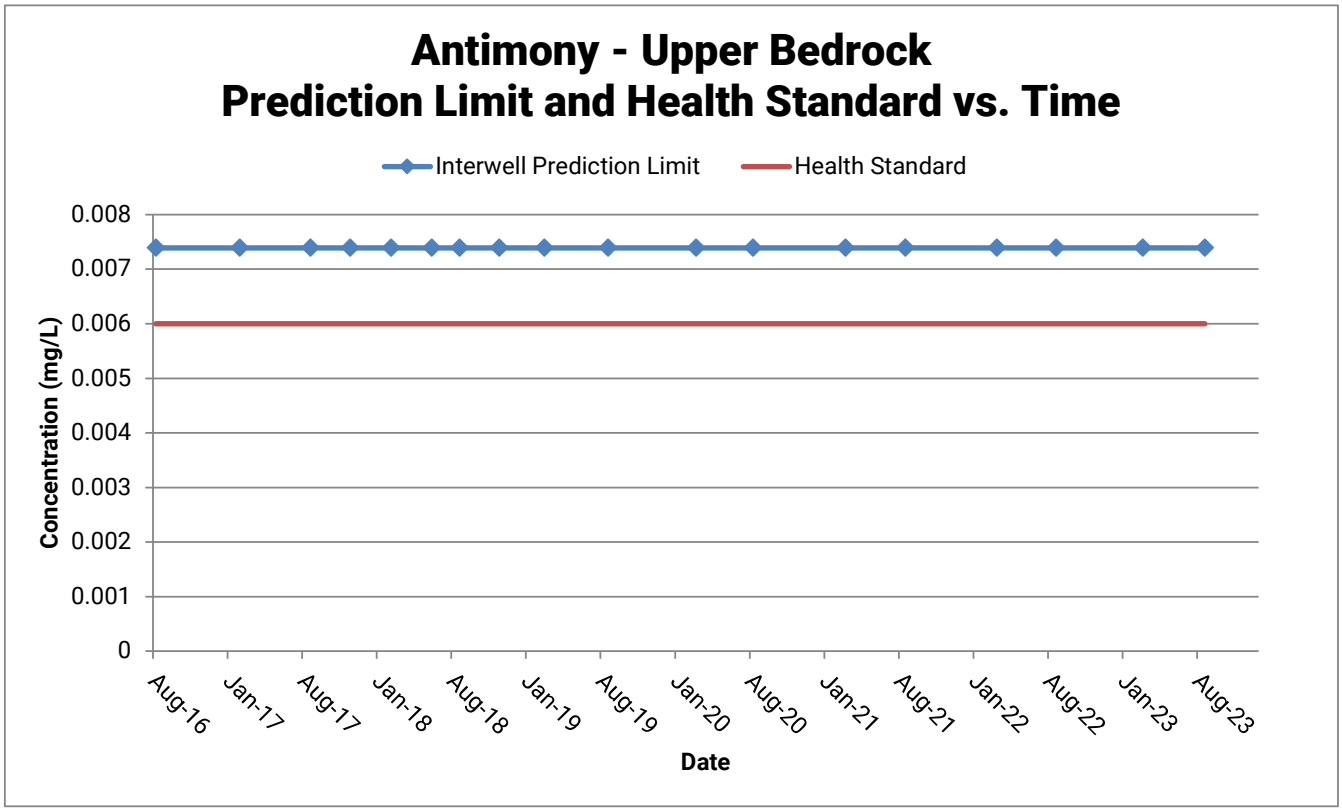
Comments:

[1] List contains constituents detected above the laboratory MDL and includes J-flagged concentrations.

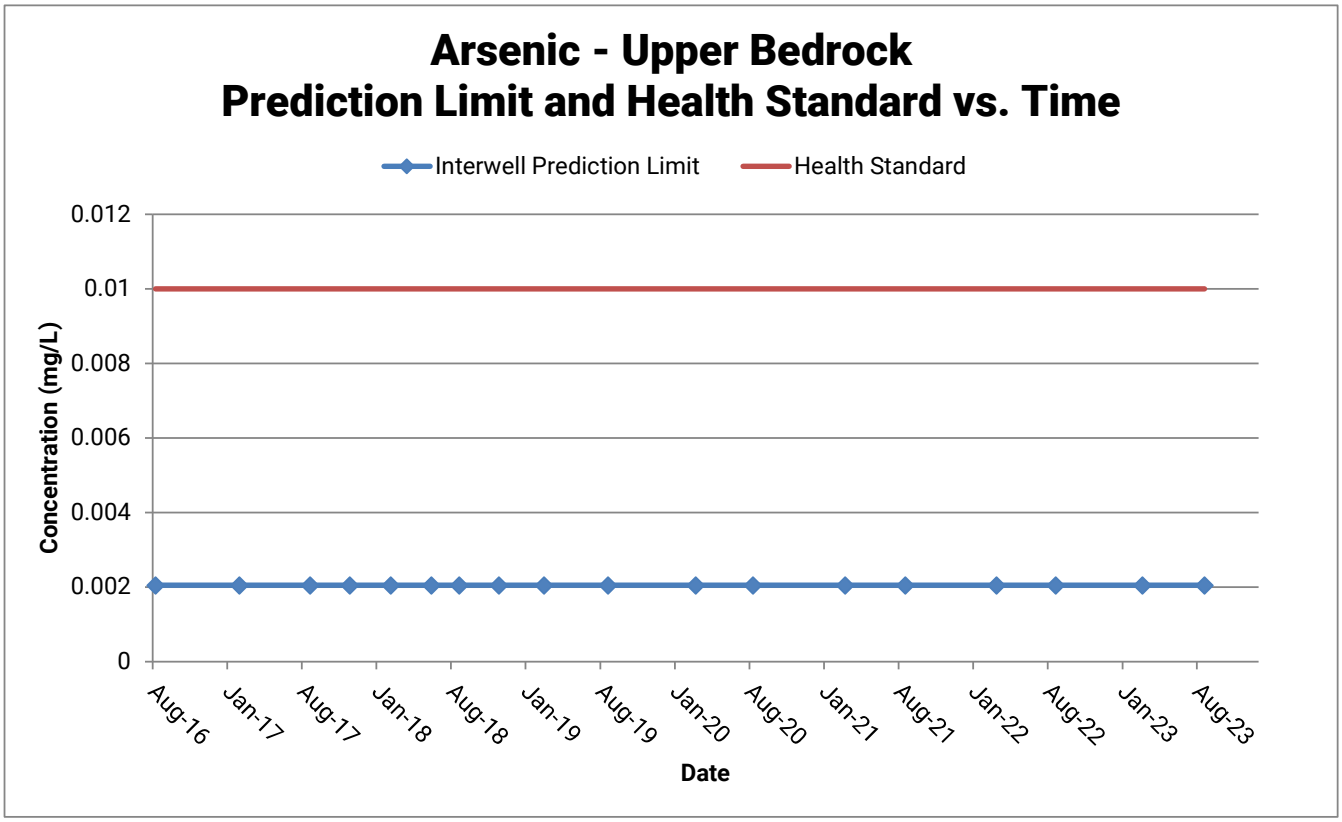
[2] Source of background standards are provided in the Fall 2023 statistical evaluation memo, which will be submitted with the 2023 AWQR. N/A = not applicable.

• No SSIs were identified at deeper bedrock detection monitoring well MW-31. The future sampling schedule is provided in Table 2.

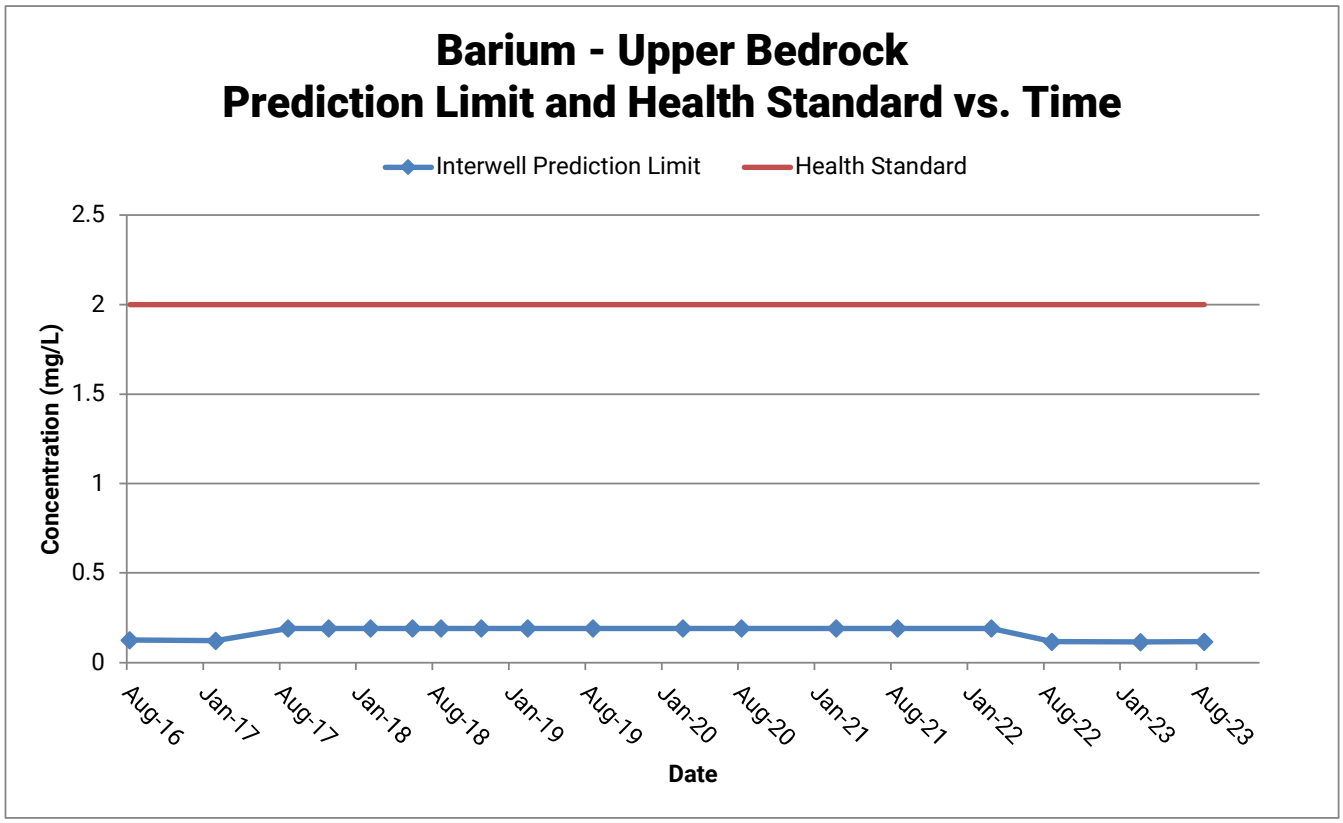
Summary of Prediction Limits and Health Standards
2023 Annual Water Quality Report
Cedar Rapids Linn County Solid Waste Agency Site 1
Permit No. 57-SDP-03-75C



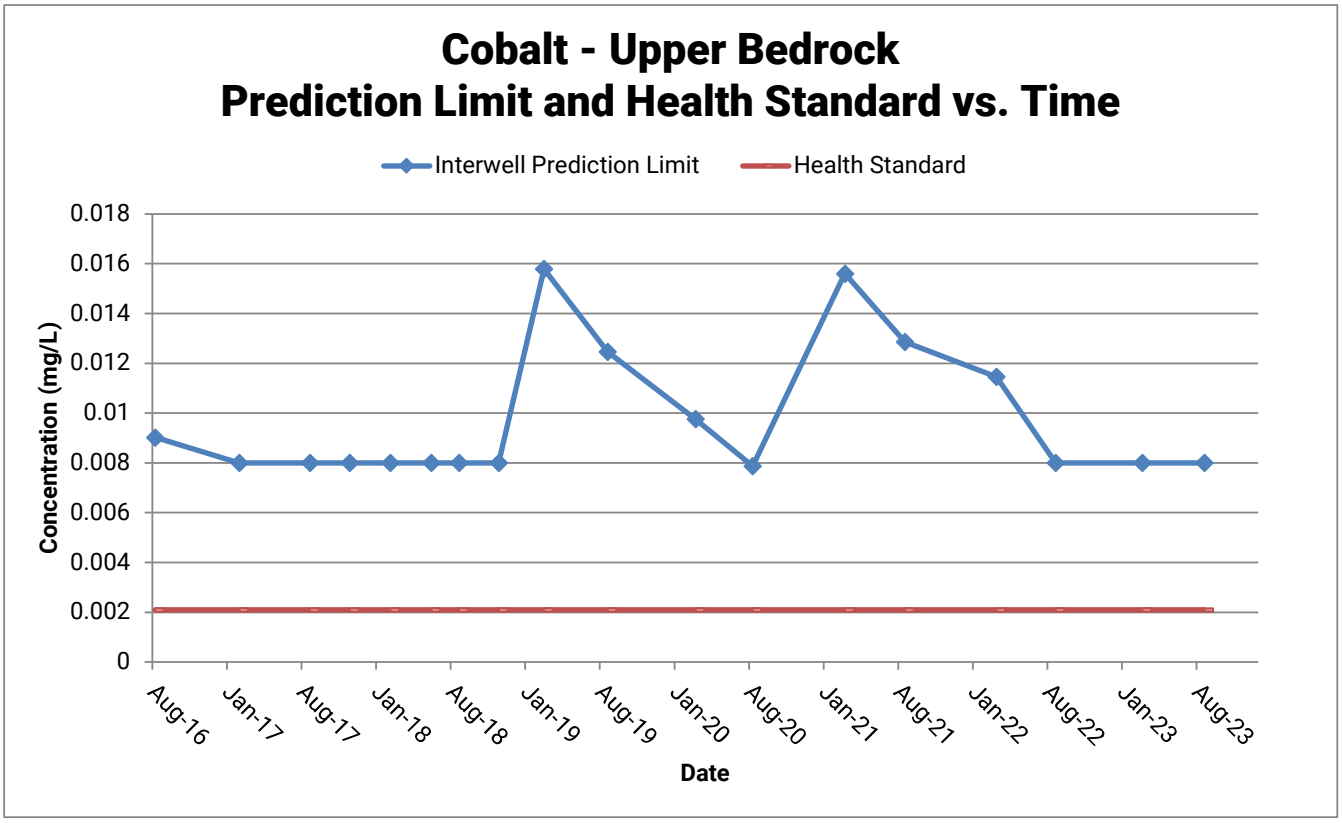
Comments:



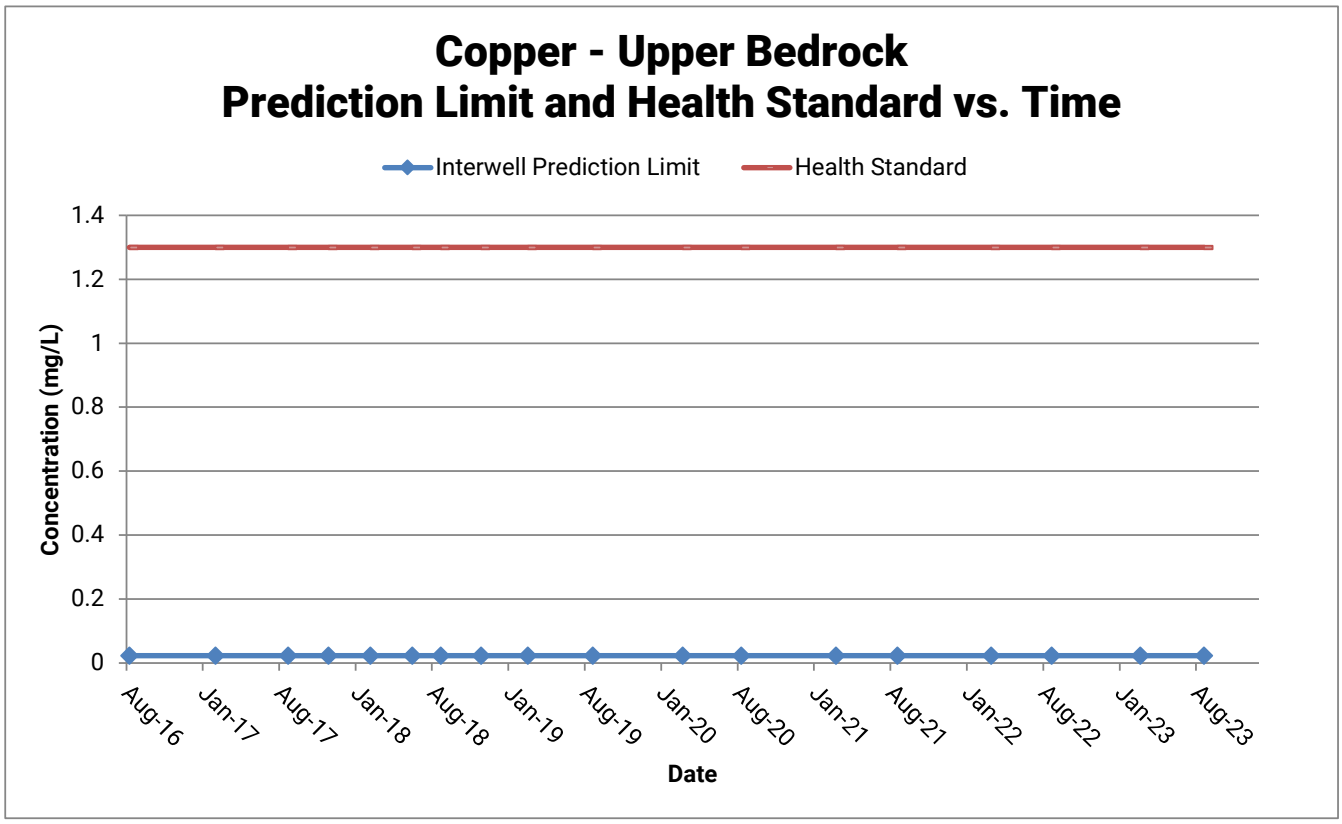
• The following graphs depict the interwell prediction limits for upper bedrock and deeper bedrock calculated for statistical analyses starting with the Fall 2016 statistical evaluation. Note that the Fall 2016 statistical evaluation was when data set adjustments due to sampling technique changes were implemented.



• Wells included in the background data sets and the sources of the background and health standards are presented in Table 5.



• For cobalt in upper bedrock, a notable increase in the prediction limit occurred with the Spring 2019 statistical evaluation due to a change from a non-parametric to a lognormal parametric method. A decreasing trend in the lognormal parametric prediction limit occurred between Spring 2019 and Fall 2020, with the Fall 2020 prediction limit nearly equal to the non-parametric limit utilized prior to Spring 2019. The decreasing trend occurred due to the increasing number of background samples utilized to calculate the lognormal parametric prediction limit and not due to decreasing trends in the background upper bedrock cobalt data. Another shift in the lognormal parametric prediction limit occurred between Fall 2020 and Spring 2021. The increased lognormal parametric prediction limit in Spring 2021 resulted from changes in the statistical configuration; specifically, changing from a 1-of-3 to a 1-of-2 retesting plan and changing the number of well/constituents pairs statistically evaluated with the implementation of the monitoring frequency optimizations. A decreasing trend in the lognormal prediction limit occurred between Spring 2021 and Spring 2022, which is again attributed to increasing background sample size for calculating the lognormal parametric prediction limit and not due to decreasing trends in the background upper bedrock cobalt data. In Fall 2022, the upper bedrock cobalt prediction limit changed from a lognormal parametric method to a non-parametric method again because normality could not be met. Cobalt continued to be analyzed using the non-parametric method through Fall 2023; therefore, the prediction limit has remained the same.



• The decreasing trend in the prediction limit for cobalt in deeper bedrock from Spring 2017 to Fall 2020 is attributed to the relatively small background sizes evaluated using lognormal parametric methods and not to decreasing trends in the individual well/analyte data. As occurred with the upper bedrock prediction limit for cobalt, an increase in the lognormal parametric prediction limit occurred in Spring 2021 as a result of changes in the statistical configuration; specifically, changing from a 1-of-3 to a 1-of-2 retesting plan and changing the number of well/constituents pairs statistically evaluated with the implementation of the monitoring frequency optimizations. The lognormal prediction limit remained fairly stable between Spring 2021 and Fall 2023.

* For assessment monitoring locations, all current results are below background. If confirmed by a second event, location may return to detection monitoring in accordance with IAC 113.10(6)e. However, three consecutive events will be utilized to make the determination to return to detection monitoring to limit frequent fluctuation of wells moving between the detection and assessment monitoring program.

** LCL has exceeded the GWPS, this well/constituent pair is now identified as an SSL.

*** Non-MSWLF Unit source of the SSI identified.

Table 7
Summary of Ongoing and Newly Identified SSIs
2023 Annual Water Quality Report
Cedar Rapids Linn County Solid Waste Agency Site 1
Permit No. 57-SDP-03-75C

Comments:

N/A = Not applicable.

N/S = Not resampled; SSI was declared in lieu of conducting resample(s).

GWPS = Groundwater Protection Standard

(1) List contains constituents which have been identified as SSIs in Fall 2023. Unless otherwise noted, all current results listed in this table are above background. SSIs were declared in lieu of conducting resample(s).

(2) Most recent results are from Aug. 2023.

(3) Source of background standards and GWPS values are presented in Table 5. If constituent isn't listed in Table 5 (indicating constituent hasn't been detected in background), then the background standard is the laboratory RL and the GWPS is the MCL or the SS if there's no MCL.

(4) Upper and deeper bedrock detection, assessment, and corrective action monitoring locations initiated the Appendix I/II monitoring required by the 2007 rule revisions with assessment monitoring for the full Appendix II list starting in Aug. 2008. Since locations were already in assessment monitoring, the initial statistical exceedances over background were declared as SSIs in lieu of conducting resample(s).

(5) During previous statistical evaluations, arsenic in MW-20 was evaluated as a corrective action constituent. Arsenic in MW-20 exited corrective action and returned to an assessment constituent in Fall 2023 in accordance with IAC 113.10(9)e(2) since compliance with the GWPS had been achieved for a duration of three consecutive years during the Fall 2022 statistical evaluation.

• No SSLs were identified for the upper and deeper bedrock assessment monitoring locations. None of the upper and deeper bedrock assessment monitoring locations have had all Appendix II constituents below background for three consecutive sampling events; therefore, the upper and deeper bedrock assessment monitoring locations will not exit assessment monitoring at this time. Details regarding the future sampling schedules are provided in Table 2.

• No SSLs were identified for the assessment constituents in the upper and deeper bedrock corrective action monitoring locations. These locations will continue corrective action monitoring in 2024 as listed in Table 2. A summary of the statistical comparisons for the corrective action constituents is provided in Table 8.

• No SSLs were identified for the assessment constituents in the upper and deeper bedrock delineation monitoring wells. These locations will continue delineation monitoring in 2024 as listed in Table 2. A summary of the statistical comparisons for the corrective action constituents is provided in Table 8.

* This well/contaminant pair has been compliant for 3 consecutive years and no longer has an SSL.

** Non-MSWLF Unit source of the SSL identified.

Table 8
Summary of Ongoing and Newly Identified SSLs
2023 Annual Water Quality Report
Cedar Rapids Linn County Solid Waste Agency Site 1
Permit No. 57-SDP-03-75C

Comments:

GWPS = Groundwater Protection Standard

N/A = Not applicable; indicates the analyte/well pair has not achieved compliance with the GWPS (i.e., upper confident limit or the upper 95% confidence limit on the trend line is lower than the GWPS for a period of three consecutive years).

(1) The most recent results are from the Aug. 2023 event.

(2) If a decreasing trend was identified, the value is the upper 95% confidence limit on the trend line.

(3) Source of GWPS values are presented in Table 5. If constituent isn't listed in Table 5 (indicating constituent hasn't been detected in background), then the GWPS is the MCL or the SS if there's no MCL.

(4) Arsenic in MW-20 exited corrective action and returned to an assessment constituent in Fall 2023 in accordance with IAC 113.10(9)e(2) since compliance with the GWPS had been achieved for a duration of three consecutive years during the Fall 2022 statistical evaluation. As a result, arsenic in MW-20 was removed from this table. Note that MW-20 will remain in corrective action monitoring until all corrective action constituents are compliant with the GWPS for three consecutive years.

• For the corrective action constituents in the upper bedrock corrective action and delineation monitoring locations, SSLs over the GWPS remained for arsenic in AW-1, AW-2, MW-12, MW-13, MW-16, MW-17, MW-24, MW-30, MW-32, MW-34, and MW-106A; for cobalt in MW-105A and MW-106A; for thallium in AW-2 and MW-20; and for vinyl chloride in MW-34. While compliance with the GWPS was not achieved, statistically significant decreasing trends were identified for arsenic in AW-1, MW-12, MW-17, MW-24, MW-30, MW-34 and MW-106A; cobalt in MW-105A; thallium in AW-2 and MW-20; and vinyl chloride in MW-34.

• Compliance with the GWPS was achieved for cobalt in MW-35 starting with the Fall 2022 statistical evaluation. In accordance with IAC 113.10(9)e(2), cobalt in MW-35 will return to an assessment constituent in 2025 as long as concentrations remain statistically below the GWPS during interim statistical evaluations.

• For the corrective action constituents in the deeper bedrock corrective action and delineation monitoring locations, SSLs over the GWPS remained for arsenic in CRL-9, MW-14, MW-22, MW-33, MW-36, and MW-109B; for cobalt in AW-6, CRL-9, MW-22, MW-105B, and MW-109B; and for thallium in MW-109B. While compliance with the GWPS was not achieved, a statistically significant decreasing trend was identified for cobalt in MW-109B.

• No changes are recommended for the upper and deeper bedrock corrective action and delineation monitoring locations based on the corrective action statistical results conducted during the Fall 2023 statistical evaluation.

Comments:

N.S. = Not sampled due to 1) well not installed yet; 2) location was dry or inaccessible; 3) location was not included in quarterly baseline/retesting/semiannual event; 4) only limited parameters analyzed during quarterly event; or 5) well returned to detection monitoring and Appendix II parameter is no longer sampled.

(1) After the Spring 2020 statistical evaluation, cobalt in AW-5 and MW-17 achieved compliance with the GWPS for a duration of three years. As a result, cobalt in AW-5 and MW-17 returned to assessment constituents starting with the Fall 2020 statistical evaluation in accordance with IAC 113.10(9)e(2).

Table 9
Historic SSIs and SSLs
2023 Annual Water Quality Report
Cedar Rapids Linn County Solid Waste Agency Site 1
Permit No. 57-SDP-03-75C

Comments Continued:

(2) After the Fall 2019 statistical evaluation, nickel in MW-12; cobalt, nickel, and vinyl chloride in MW-13; and arsenic in VP-3 had achieved compliance with the GWPS for durations of three or more years. As a result, these analyte/well pairs returned to assessment constituents starting with the Spring 2020 statistical evaluation in accordance with IAC 113.10(9)e(2).

(3) After the Fall 2022 statistical evaluation, arsenic in MW-20 had achieved compliance with the GWPS for a duration of three years. As a result, arsenic in MW-20 returned to an assessment constituent starting with the Fall 2023 statistical evaluation in accordance with IAC 113.10(9)e(2). Note: as indicated in Table 2, MW-20 is sampled annually in accordance with Permit Amendment #16.

(4) MW-104B is only analyzed for cobalt in accordance with the *Response to DNR Comments dated March 10, 2015* letter (Foth, 2015b). Note that in Spring 2019, MW-104B was inadvertently sampled for the Appendix I list and TSS. However, since analysis is intended to be limited to cobalt and TSS at MW-104B, only cobalt in MW-104B was evaluated for SSIs and SSLs during the Spring 2019 statistical evaluation. In Fall 2019, MW-104B resumed semiannual delineation monitoring for cobalt and TSS.

(5) IDNR approved the removal of cobalt from the list of analytes at MW-108B in the letter dated April 16, 2019 (IDNR, 2019). Cobalt was analyzed during the Mar. 2019 event since the event occurred prior to the IDNR approval letter; however, the Mar. 2019 result for cobalt in MW-108B was not included in the Spring 2019 statistical evaluation. Starting in Aug. 2019, cobalt was not included in the Appendix I analysis at MW-108B.

[1] At W-212, the elevation could not be measured in Dec. 2023 due to a restriction that was encountered at 72.2 feet below TOC (bTOC) in Dec. 2023.

[2] At W-217, a restriction was encountered at 63 feet bTOC starting in Jul./Sep. 2022 and remained throughout 2023; therefore, elevations could not be measured at this location in 2023. Field staff comments indicated hard refusal indicating the obstruction is due to well collapse.

- The contents of this report are intended to satisfy the requirements set forth in 567 IAC 113.26(8)d (effective 1/15/03).
- In 2023, there was no correlation between precipitation and leachate elevations or volumes.
- Limited maintenance is required for the leachate collection system because it consists of gravity draining side-slope laterals and a perimeter gravity toe drain. There are no pumps, tanks, or lagoons which require maintenance. In Jan. 2023, maintenance was performed on the associated gas collection system which consisted of installing new belts on the blower, cleaning the flame arrestor, and restoring vaccuum in the the gas wells.
- Leachate line cleaning and inspection was last conducted in Jul. 2022 by Roto-Rooter. The next line cleaning and inspection will be performed in 2025.
- Performance of the leachate collection is evaluated in Table 12.
- Laboratory analytical results for leachate testing, as submitted to CRWPC, are included in Appendix C.

Cedar Rapids Linn County Solid Waste Agency Site 1
Permit No. 57-SDP-03-75C

Leachate Collection System Description:

• Construction of the existing leachate collection system was completed in Nov. 2007. A previous leachate pumping system, consisting of 13 low flow pumps in existing gas wells, was demonstrated to be ineffective, and the pumps were abandoned in 2005 as approved by IDNR.

• The existing leachate collection system consists of a gravity toe drain encompassing the perimeter of Site 1 (except for the south and southeast corner of the site) and laterals up the side slope (HRG, 2006). From Jun. 2008 through Spring 2013, Site 1 re-opened to receive disaster debris from the Jun. 2008 flood. Construction of the final landfill cover for Site 1 was completed in Aug. 2013. The final cover included an additional perforated liquid collection line surrounding the perimeter of the final cap.

• Leachate volumes collected in the toe drain are measured via a meter (LM-1) located in the northeast corner of the site, north-northeast of the Recreational Facility. Leachate is conveyed from LM-1 to the CRWPC via the sewer main. The Agency discharges leachate to CRWPC under an industrial discharge permit.

Comments:

amsl = above mean sea level

N/A = not applicable

[1] W-212 was added to the leachate elevation monitoring network starting in 2022.

[2] The 2022 annual average elevation at W-217 was calculated using the Feb. through Jun. 2022 and Aug. 2022 elevations. In 2023, the leachate elevation could not be measured due to a restriction that was encountered at 63 feet bTOC.

• Monthly leachate elevations measured between Jan. and Dec. 2023 are presented in Table 11. The average annual leachate elevations computed using measurements collected between Aug. 2013 and Dec. 2023 for each well are presented in this table (Table 12). Leachate contours are depicted with the groundwater contours in Figures 2 and 3.

• In accordance with Permit Special Provision X.10.c, effective control for an existing landfill is defined as achieving the lowest possible head as required in IAC 113.26(12)b(2) and maintaining surface and groundwater quality standards at compliance monitoring points.

• Leachate contours generally reflect the ground surface contours, with the highest leachate elevations near the top of the landfill where the greatest accumulation of waste is located, and the lowest leachate elevations located along the perimeters of the landfill. This leachate pattern is consistent with previous years and represents no significant change.

• Monthly fluctuation in the 2023 elevations was observed and did not correlate with precipitation. The leachate elevation fluctuations at Site 1 are likely attributable to differential settlement. During settlement, changes in leachate elevations are anticipated due to the physical characteristics of the waste and influence of less permeable layers within the landfill created during placement of daily soil cover. These layers can promote lateral movement of leachate and create perched leachate zones within the waste, which may not be representative of overall leachate head levels in the landfill. Landfill settlement and the resulting variations in leachate elevations are anticipated to continue as the waste degrades.

• Review of the average annual leachate elevations indicates stable or declining elevations at most of the leachate monitoring locations: W-100 (decreasing from 2020-2023), W-102 (stable since 2019), W-104 (stable to slightly decreasing since 2010), W-105 (stable since 2014), W-110 (stable 2019-2021 then decreasing), W-115 (stable 2015-2020 then decreasing), W-117 (stable since 2015), W-203 (decreasing to stable since 2014), W-207 (stable to slightly decreasing since 2014), W-209 (slightly decreasing/stable since 2014), W-211 (stable to decreasing since 2016), W-212 (decreasing in 2022-2023), and W-219 (stable since 2013). Discussions regarding W-103, W-212, and W-217 are provided below.

• At W-103, a slightly increasing trend was identified from 2010 to 2023 with elevations increasing by approximately 7.5 feet during this period. The slope of the increasing trend has been decreasing over time. From 2021-2023, elevations have remained approximately stable.

• At W-212, a casing restriction was encountered at 72.2 feet bTOC in Dec. 2023, which was identified once the liquid level decreased below this level (previous leachate levels were above than 72.2 feet bTOC). As depicted in Figure 4, W-214 is an existing leachate piezometer located approximately 400 feet east of W-212. Replacement of W-212 with W-214 is recommended for monitoring leachate elevations along the mid-central portion of the north side of Site 1.

• At W-217, a casing restriction was encountered at 63 feet bTOC starting in Jul./Sep. 2022 and remained throughout 2023. As reported in the *2022 AWQR* (Foth, 2023), repair or replacement of W-217 is not recommended. As detailed in *Response to DNR Comments dated March 10, 2015* (Foth, 2015b), several leachate wells cannot be repaired or replaced at the same location due to the presence of construction and demolition debris within the waste. W-217 is located near the top of the landfill in an area that was reopened and filled with disaster debris from the 2008 flood. Therefore, W-217 cannot be repaired or replaced at the same location. In addition, there are no suitable replacement locations to provide coverage near the top of the landfill due to the construction and demolition debris filled there. Surrounding W-217 at lower elevations, W-110, W-203, W-209, W-211, and W-219 provide good coverage below the top-central part of the landfill. Since leachate elevations remained below the restriction in 2023, removal of W-217 from the leachate monitoring network is recommended.

Table 12
Average Annual Leachate Elevations
2023 Leachate Collection System Performance Evaluation Report
Cedar Rapids Linn County Solid Waste Agency Site 1
Permit No. 57-SDP-03-75C

Conclusions:

• Site operations and management practices have been consistent with the regulatory intent to achieve the lowest possible leachate head levels. The leachate collection system continues to function as designed, and monthly elevations are collected to monitor short-term and long-term trends in the leachate elevation data. In 2023, no significant change to the leachate contour pattern occurred, and the variation in elevations was not correlated with precipitation. Steady to declining leachate elevations were generally observed, which, along with no apparent correlation with precipitation, supports that construction of the final cover and additional stormwater controls appears to have been effective in reducing infiltration.

• Groundwater and Surface Water Quality: Because the waste was deposited within an old rock quarry located adjacent to the river that had been mined into the water table, there is a component of natural groundwater flow through the waste that cannot be eliminated. This condition exacerbates some of the water quality issues presented in previous Annual Water Quality Reports and Leachate Control System Performance Evaluation Reports. During 1998-2001, groundwater quality assessments were conducted to address a leachate release into the groundwater surrounding the landfill (HRG, 1998, 1999, 2000, and 2001). In 2019, IDNR approved continued implementation of a monitored natural attenuation remedy (IDNR, 2019) in accordance with the Risk Management Plan in the *Phase II Groundwater Quality Assessment Report* (HRG, 2001) and the revised remedy implementation schedule outlined in the *2018 AWQR* (Foth, 2019a). Compliance with the conditions set forth in the Risk Management Plan was maintained in 2023. As detailed in Tables 1-11, the groundwater plumes are generally steady or declining. In accordance with Permit Amendment #16, surface water monitoring has been discontinued. Under current flow conditions, leachate impacts to surface water are not applicable.

Requests:

• On behalf of the Agency, Foth requests IDNR review and approval to amend the Permit Special Provision X.10 and the leachate monitoring network by replacing W-212 with W-214 and removing W-217. Replacement of W-212 with W-214 will maintain adequate coverage since W-214 is located 400 feet east of W-212 and will continue to monitor leachate elevations along the mid-central portion of the north side of Site 1. Removal of W-217 is recommended since it cannot be repaired or replaced at the same location, and there are no suitable replacement locations to provide coverage near the top of the landfill due to the construction and demolition debris filled there.

* To satisfy IAC 113.10(9)e(2)
Permit holder addresses adequacy of corrective measure when trend is not favorable
Permit shall adjust corrective action for financial assurance as completion date warrants

Comments:

N - Number of Samples

* For remedy completion [IAC 113.10(9)e(2)], compliance with the GWPS is considered achieved by demonstrating that concentrations of Appendix II constituents have not exceeded the GWPS for a period of three consecutive years or an alternate length of time established by the IDNR.

[1] For corrective action constituents that have achieved compliance with the GWPS, the projected year to completion listed is 3 years after compliance was first achieved (i.e., 3 years after the First Occurrence listed in Table 8) and will remain as long as concentrations remain statistically below the GWPS during the interim statistical evaluations. Individual analyte/well pairs will return to assessment constituents once compliance with the GWPS has been achieved for a period of 3 years. In accordance with IAC 113.10(9)3(2), a well may not return to assessment monitoring until all detected constituents are below the GWPS.

Table 10
Corrective Action Trend Analysis
2023 Annual Water Quality Report
Cedar Rapids Linn County Solid Waste Agency Site 1
Permit No. 57-SDP-03-75C

Comments (Continued):

(2) For the remaining corrective constituents (i.e., those that have not achieved compliance with the GWPS), the projected year to completion is based on the estimated first order attenuation rates for individual analyte/well pairs evaluated as part of the Fall 2023 statistical evaluation (Appendix B). The projected years to completion are 3 years after the first order attenuation rates projected initial compliance with the GWPS.

(3) For arsenic in MW-13, the trend and first order attenuation rate was evaluated using the Mar. 2013 through current data. Time-series analysis indicated that earlier pre-2013 arsenic concentrations were notably different from the 2013-current data and that a maximum arsenic concentration was reached in Mar. 2014. As a result, the earlier data was not utilized in evaluating trends or calculating first order regression. Similarly, the trend and first order attenuation rates for arsenic in MW-32 and arsenic in MW-36 were evaluated using the Mar. 2013 through current data and the Mar. 2011 through current data, respectively. For arsenic in MW-32, time-series analysis indicated that earlier pre-2013 arsenic concentrations were notably different from the 2013-current data; therefore, the earlier data was not utilized in evaluating trends or calculating first order regression. For arsenic in MW-36, time-series analysis indicated that earlier pre-2011 arsenic concentrations were notably different from the 2011-current data; therefore, the earlier data was not utilized in evaluating trends or calculating first order regression.

(4) For arsenic in MW-16, the trend and first order attenuation rate was calculated using the Mar. 2013 to current data. For arsenic in CRL-9, the trend and first order attenuation rate was calculated using the Sep. 2010 to current data. While no trend was statistically identified using all data (Aug. 2008 to current), some attenuation was visually evident in the Mar. 2013 to current arsenic data at MW-16 and the Sep. 2010 to current data for arsenic in CRL-9.

(5) For thallium in MW-20 and arsenic in MW-30, the first order attenuation rates projected that compliance with the GWPS has already been achieved (i.e., Aug. 2018 for thallium in MW-20 and Feb. 2021 for arsenic in MW-30). However, the confidence bands placed around the linear trend line have not yet indicated compliance with the GWPS for these analyte/well pairs (although it is noted that thallium in MW-20 and arsenic in MW-30 are close to statistically achieving compliance with the GWPS and the Aug. 2022 and Aug. 2023 individual results were below the GWPS). For these analyte/well pairs, it has been assumed that compliance with the GWPS will be statistically achieved in 2024 and the projected year to completion for these analyte/well pairs will be 2027.

(6) For cobalt in AW-6, the trend and first order regression rate were calculated using the Mar. 2012 to current data. For cobalt in CRL-9, the trend and first order regression rate were calculated using the Mar. 2015 to current data. For arsenic in MW-109B, the trend and first order regression rate were calculated using the Nov. 2018 to current data. Time-series analysis revealed that the first three samples in AW-6, the first sample in CRL-9, and the first four samples in MW-109B were lower than the rest of the data and not representative for evaluation of trends.

(7) For arsenic in MW-22 and MW-33, trends were evaluated using the Mar./Sep. 2015 through current data. Time-series analysis identified a shift in the data that correlated with a change in sampling technique from high-volume to low-flow sampling. As a result, the high volume data was not utilized in evaluating trends or calculating first order regression.

Conclusions and Recommendations:

- In 2023, one corrective action constituent/well pair (i.e., arsenic in MW-20) returned to an assessment constituent. As a result, arsenic in MW-20 is no longer listed in this table. Statistical comparisons associated with this assessment constituent are included in Tables 7 and 8.
- Compliance with the GWPS was maintained for cobalt in MW-35 in 2023. Cobalt in MW-35 will return to an assessment constituent in 2025 as long as concentrations remain statistically below the GWPS during interim statistical evaluations.
- Stable or decreasing trends were identified for the corrective action constituents. In addition, first order attenuation was now able to be evaluated to project a year to completion for arsenic in MW-17, MW-14, and MW-109B and for thallium in MW-109B.
- Additional discussion regarding the status of corrective action activities, including an evaluation of the effectiveness of the progress being made, is provided in Section 4 of the 2023 AWQR.

BLDG-12	Indoor	Scale House	0		0		0		0	

S (Y/N) - Was screen submerged, yes or no or blank is non-applicable

Comments:

% = percent

• The contents of this report are intended to satisfy the requirements set forth in 567 IAC 113.26(15)b (effective 1/15/03).

• As shown on Table 13, the quarterly methane monitoring results did not indicate concentrations in exceedance of 25% LEL for facility structures or 100% LEL for facility boundaries.

Table 14
Analytical Data Summary
2023 Annual Water Quality Report
Cedar Rapids Linn County Solid Waste Agency Site 1
Permit No. 57-SDP-03-75C

Comments:

The following table presents the groundwater upper and deeper bedrock Appendix II analytical data collected since August 2008. In accordance with Permit Amendment #16, MW-27, MW-29, MW-102A, MW-103A, MW-103C, and MW-108A were removed from the groundwater monitoring network and surface water monitoring was discontinued starting with the Fall 2020 sampling event. Due to the removal of surface water monitoring in 2020, the surface water analytical results are no longer provided in this table.

Detections above the laboratory MDL are shown in **bold**.

DwnGrad = downgradient (compliance) monitoring location.

Bkgrnd = background monitoring location.

Delin = delineation monitoring location.

• Previously approved groundwater background data set adjustments were maintained and are listed as crossed-out concentrations in Table 14. This includes: removal of the high volume September 2009 through September 2014 metals data at MW-101A; removal of the high volume September 2009 through September 2014 and the initial low-flow March 2015 metals data at MW-101B; removal of the March 2019 barium concentration in MW-38 due to elevated TSS; removal of earlier non-detect data with elevated PQLs for barium, cobalt, copper, and lead in the upper bedrock; removal of earlier non-detect data with elevated PQLs for barium, beryllium, cadmium, cobalt, copper, lead, and nickel in the deeper bedrock; and removal of the August 2018 detected metals data at MW-37 due to potential impact indicated by benzene, toluene, ethylbenzene, and total xylenes detections.

• The following background data set adjustments were recommended in 2023 and are listed as crossed-out concentrations in Table 14.

  • Removal of the Mar. 2023 barium, cadmium, cobalt, copper, nickel, selenium, and vanadium data at MW-101A due to elevated TSS.

• Previously approved groundwater downgradient data set adjustments were maintained and are listed as crossed-out concentrations in Table 14:

  • Removal of earlier non-detect data with elevated PQLs for upper bedrock cobalt data at AW-5, MW-13, MW-17, MW-23, and MW-35; removal of earlier non-detect and J-flagged data with elevated PQLs for deeper bedrock cobalt data at AW-6, CRL-9, MW-11, MW-14, MW-15, MW-22, MW-33 MW-36, MW-102B, MW-105B, and MW-107B; removal of earlier non-detect and J-flagged data with elevated PQLs for the deeper bedrock nickel data at AW-6, CRL-9, MW-14, MW-15, MW-18, MW-19, MW-22, MW-33, and MW-36; removal of the high volume August 2008 through September 2014 zinc data at AW-7, MW-20, and MW-30; and removal of the high volume August 2008 through September 2014 nickel data at MW-13.

  • Removal of the historical data prior to when statistical compliance with the GWPS was first achieved for analyte/well pairs exiting corrective action and returning to assessment constituents. Compliance with the GWPS was first achieved in Spring 2015 for nickel in MW-12 and vinyl chloride in MW-13; in Fall 2016 for cobalt and nickel in MW-13 and cobalt in MW-23; in Spring 2017 for arsenic in VP-3; and in Fall 2017 for cobalt in AW-5 and MW-17. The historical data prior to these initial compliance dates have been removed. Section 5.1.3 of the Fall 2023 statistical evaluation provides a detailed listing of the historical data removed due to exiting corrective action.

• The following groundwater downgradient data set adjustments were recommended in 2023 and are listed as crossed-out concentrations in Table 14.

  • Removal of the historical data prior to when statistical compliance with the GWPS was first achieved for arsenic in MW-20 exiting corrective action and returning to an assessment constituent in Fall 2023. Compliance with the GWPS was first achieved in Spring 2020; therefore, the historical arsenic data prior to Spring 2020 have been removedfor MW-20. Section 5.1.3 of the Fall 2023 statistical evaluation provides a detailed listing of the historical data removed due to exiting corrective action.

• Previously rejected data resulting from data validation were maintained and are listed as crossed-out concentrations in Table 14:

  • Removal of the Aug. 2022 m,p-cresol and phenol results at MW-37 and MW-101A. As detailed in the data validation report for the Aug. 2022 event, these results were rejected due to surrogate recoveries that were below the expanded lower acceptance limit.

• The following data were rejected during data validation in 2023 and are listed as crossed-out concentrations in Table 14:

  • Removal of the Jan. 2023 1,4-phenylenediamine (i.e., p-phenylenediamine) result in MW-26. As detailed in the data validation report for the Jan. 2023 event, this result was rejected due to laboratory control sample/laboratory control sample duplicate recoveries that were below the acceptance limit.

Job Notes

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to the NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory. This report is confidential and is intended for the sole use of Eurofins Environment Testing North Central, LLC and its client. All questions regarding this report should be directed to the Eurofins Environment Testing North Central, LLC Project Manager who has signed this report.

The test results in this report relate only to the samples as received by the laboratory and will meet all requirements of the methodology, with any exceptions noted. This report shall not be reproduced except in full, without the express written approval of the laboratory. All questions should be directed to the Eurofins Environment Testing North Central, LLC Project Manager.

Comments
No additional comments.

Receipt
The samples were received on 1/27/2023 12:40 PM. Unless otherwise noted below, the samples arrived in good condition, and where required, properly preserved and on ice. The temperature of the cooler at receipt was 3.7º C.

GC/MS VOA
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

GC/MS Semi VOA
Method 8270E: The continuing calibration verification (CCV) associated with batch 310-377973 recovered above the upper control limit for Di-n-octyl phthalate (24.1%D). The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported.

Method 8270E: The laboratory control sample and/or the laboratory control sample duplicate (LCS/LCSD) for preparation batch 310-377951 and analytical batch 310-378204 recovered outside control limits for the following analyte(s): 2,4-Dinitrophenol and p-Phenylene diamine. 2,4-Dinitrophenol and p-Phenylene diamine have been identified as poor performing analytes when analyzed using this method; therefore, re-extraction/re-analysis was not performed

Method 8270E: The laboratory control sample and/or the laboratory control sample duplicate (LCS/LCSD) for preparation batch 310-377951 and analytical batch 310-378204 recovered outside control limits for the following analyte(s): 3,3'-Dichlorobenzidine and p-Phenylene diamine. 3,3'-Dichlorobenzidine and p-Phenylene diamine has been identified as a poor performing analyte when analyzed using this method; therefore, re-extraction/re-analysis was not performed.

Method 8270E: The RPD of the laboratory control sample (LCS) and laboratory control sample duplicate (LCSD) for preparation batch 310-377951 and analytical batch 310-378204 recovered outside control limits for multiple analytes.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

GC Semi VOA
Method 8081B: The continuing calibration verification (CCV) associated with batch 310-378700 recovered above the upper control limit for 4,4'-DDE (24.7 %D). The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Metals
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

General Chemistry
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Organic Prep
Methods 3510C, 625: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with preparation batch 310-377951.The laboratory control sample (LCS) was performed in duplicate (LCSD) to provide precision data for this batch.

Methods 3510C, 608: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with preparation batch 310-377959.The laboratory control sample (LCS) was performed in duplicate (LCSD) to provide precision data for this batch.

Job ID: 310-248830-1 (Continued)

Laboratory: Eurofins Cedar Falls (Continued)

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

VOA Prep
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Detection Summary

Client: Foth Infrastructure & Environment, LLC
Project/Site: CRLCSWA_1

Job ID: 310-248830-1
SDG: 22C061_23_02

Client Sample ID: MW-26_23_02 — Lab Sample ID: 310-248830-1

Analyte	Result	Qualifier	RL	MDL	Unit	Dil Fac	D	Method	Prep Type
Barium	0.139		0.00200	0.000880	mg/L	1		6020B	Total/NA
Total Suspended Solids	5.00		5.00	1.70	mg/L	1		I-3765-85	Total/NA

Client Sample ID: TB-1_23_02 — Lab Sample ID: 310-248830-2

No Detections.

This Detection Summary does not include radiochemical test results.

SDG: 22C061_23_02

Qualifiers

GC/MS Semi VOA

Qualifier	Qualifier Description
*-	LCS and/or LCSD is outside acceptance limits, low biased.
*1	LCS/LCSD RPD exceeds control limits.
E	Result exceeded calibration range.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count
