2024 Annual Water Quality Report

Black Hawk County Landfill
MSWLF Black Hawk County
Permit #7-SDP-1-75P

Black Hawk County Solid Waste Management Commission
Waterloo, Iowa

Prepared by:

AECOM
501 Sycamore Street, Suite 222
Waterloo, IA 50704-1497

Project No.: 60746421

January 2025

Table of Contents

Executive Summary ES-1
1. Background Information 1
1.1 Black Hawk County Landfill History and Construction 1
1.2 Black Hawk County Geology and Hydrogeology 2
1.2.1 Water Table 3
1.2.2 Intermediate Groundwater Elevations 3
1.2.3 Piezometric Surface in the Uppermost Bedrock 4
1.3 Summary of Hydrologic Monitoring System Plan (HMSP) 4
1.3.1 Water Table and Underdrain Monitoring Points 4
1.3.2 Bedrock Monitoring Points 6
1.3.3 Changes or Deviations to HMSP for 2024 Monitoring 7
1.3.4 Current Site Map 7
1.3.5 Current Groundwater Contour Maps 7
1.4 Monitoring Well Maintenance and Performance Re-Evaluation Plan 8
2. Reporting Period Monitoring Activities 9
2.1 Current Detection Monitoring Activities for 2024 9
2.2 Current Assessment Monitoring Activities 9
3. Data Evaluation and Summary 10
3.1 Detection, Assessment and Correction Measures Monitoring 11
3.1.1 Detection Monitoring 12
3.1.2 Assessment Monitoring 13
3.2 Quality Assurance/Quality Control Plan 15
3.2.1 Trip Blanks 15
3.2.2 Field Duplicates 16
3.2.3 Field Blanks 16
3.2.4 Field Duplicate, Field Blank, and Trip Blank Sample Results 16
4. Recommendations 18
5. References 19

Certification

Prepared by:  Date: January 31, 2025

Typed by: Russell J. Henning

Certification page (PE or ground water scientist signature) **113.10(1)"d"**

For the purposes of this rule, a "qualified groundwater scientist" means a scientist or an engineer who has received a baccalaureate or postgraduate degree in the natural sciences or engineering and has sufficient training and experience in groundwater hydrology and related fields demonstrated by state registration, professional certifications, or completion of accredited university programs that enable that individual to make sound professional judgments regarding groundwater monitoring, contaminant fate and transport, and corrective action.

Executive Summary

ES.1 Period of Report Coverage

This Annual Water Quality Report (AWQR) includes a summary of all groundwater, leachate, and landfill gas sampling completed in calendar year 2024.

ES.2 Report Priority

AECOM updated the HMSP at the end of 2024 and submitted in January 2025 that included:

- Current operating waste disposal units Cell W-3, and Asbestos Cell No. 2.
- Monitoring plan beginning in 2025.
- HMSP text, tables, figures, and appendices were updated to reflect current operating conditions.
- Appendix II - Currently, monitoring wells OW-113B, OW-205B, OW-212B, OW-221B, OW-222B, OW-223B, OW-401B, OW-402B and MW-409B have been sampled for Appendix II. Monitoring wells OW-401B, and OW-402B have been sampled each year, for the past five years for Appendix II beginning in Fall 2018. All past 1-of-2 Appendix II only detected parameters above reporting limit (RL) have been added to the individual wells' semi-annual monitoring parameter list and are sampled at each semi-annual event.
  - BHCL will sample complete list of Appendix II parameters once every five years for Appendix II wells.

ES.3 Site Status and Applicable Rules

The closed Landfill cells are IDNR regulated Areas A and C, Cells E and X, W-1, W-2, and Asbestos Cell No. 1; and the EPA RCRA regulated Co-Disposal Area and the Neutral Trench. The active IDNR regulated Municipal Solid Waste (MSW) Landfill Cell is W-3. The Commission has a separate active Asbestos Cell No. 2. The Landfill accepted MSW and Asbestos Waste in 2024 from Black Hawk, Bremer, Grundy, and Fayette Counties.

The monitoring of the site and analysis of sample data was conducted in accordance with Chapter 113 of the Iowa Administrative Code (IAC).

ES.4 Comments

An assessment of corrective measures (ACM) was implemented in 2016 because of detected organic parameter concentrations in wells OW-401B and OW-402B.

Wells OW-105B, OW-114B, OW-205B, OW-220B, OW-224B, OW-225B, OW-226B, OW-227B, OW-401B, OW-402B, OW-410B, OW-411B, OW-412B, OW-413B, OW-414B, P-402A, and P-402C are part of an ongoing assessment of corrective measures (ACM) and are discussed in a separate 2024 ACM report submitted in January 2025.

The stormwater monitoring and sampling as part of the Black Hawk Co. Landfill Stormwater Pollution Prevention Plan (SWPPP) is also being submitted IDNR NPDES in a separate report in January 2025.

A Post Closure Termination Plan for Area E and Cell X has been submitted to IDNR, see Document ID 111940.

1. Background Information

The 2024 groundwater sampling was completed at the Black Hawk County Sanitary Landfill (Landfill) in accordance with the site Hydrologic Monitoring System Plan (HMSP) and Iowa Department of Natural Resources (IDNR) permit requirements. This report summarizes the effect the Landfill is having on groundwater quality and groundwater flow. The Black Hawk County Landfill is located in rural Black Hawk County adjacent to the southern boundary of the City of Waterloo, Iowa, in Section 23, T. 88 N., R. 13 W. The street address is 1509 East Washburn Road, Waterloo, IA 50701. At the site, Area A, Area C, Area E, Cell X, Cell W-1, Cell W-2, Cell W-3, Asbestos Cell No. 1, and Asbestos Cell No. 2 are the waste disposal units regulated by the Iowa Department of Natural Resources (IDNR). The Neutral Trench and Co-Disposal Area are waste disposal units regulated by the United States Environmental Protection Agency (EPA). MSW Cell W-3, and Asbestos Cell No. 2 are currently the operating waste disposal units; all the other units are closed. The waste disposal areas are shown on Figure 1.

Information regarding the monitoring points is included in Table 1. Recent sampling events and constituents are presented in Table 2. Analysis of sample data was conducted in accordance with Chapter 113 of the Iowa Administrative Code (IAC). Input and output files used in the statistical analyses are included in Appendix A.

The monitoring well maintenance and performance evaluation schedule is provided in Table 3.

Groundwater level only monitoring wells are shown on Figure 2. Groundwater elevation data for 2024 is presented in Table 4. Groundwater elevation contour maps, based on data obtained in March 2024, are presented as Figures 3, 4 and 5.

Field sampling data forms and laboratory analytical results from the 2024 sampling events are presented in Appendices B and C. Appendix B includes tables summarizing historical Appendix I and Appendix II analytical results from each sampling point. The 2024 Leachate Control System Performance Evaluation and 2024 Methane Monitoring Report are included as Appendices D and E of this report.

1.1 Black Hawk County Landfill History and Construction

The Black Hawk County Landfill was initially developed and operated by Landfill Service Corporation in 1975. In 1984, the landfill was purchased by the Black Hawk County Solid Waste Management Commission. The landfill continued to be operated under contract by Landfill Service Corporation until 1987 when the operating contract was awarded to Denver Construction, Inc., who transferred the contract to Waste Tech, Inc., a division of Denver Construction, Inc.

At the Black Hawk County Landfill, the different cells and areas were constructed over time to different regulations and, hence, there are differences in the underdrain, liner, leachate collection, and landfill gas systems. Area A, Area C, Area E, Cell X, Cell W-1, Cell W-2, Cell W-3, Asbestos Cell No 1, and Asbestos Cell No. 2 (Figure 1) are regulated by IDNR.

Waste was placed in Area A from 1975 to 1980, and Area A is now in post-closure. Area A was constructed without an underdrain, liner, or leachate collection system.

Waste was placed in Area C from 1986 to 1991, and Area C is also in post-closure. Area C was constructed without an underdrain, liner, or leachate collection system.

Waste was placed in Area E from 1991 to 1999, and Area E is in post-closure. Area E was constructed with a groundwater underdrain system, clay liner, 10- to 12-foot-deep perimeter groundwater drainage trench, and leachate collection system.

Construction of Cell X began in 1999, and waste was placed until 2008. Cell X is in post-closure. It was constructed with a groundwater underdrain system, clay liner, and leachate collection system.

Cell W-1 was opened in 2007. Cell W-1, Phases I, II, III and IV are closed. Cell W-1is constructed with a groundwater underdrain system, clay liner, and leachate collection system.

Cell W-2 construction began in 2013, and it is built with an underdrain system, composite liner, and leachate collection system. This cell is now a closed fill area with a temporary cover.

Cell W-3 construction began in 2020 with the advanced excavation of W-3, Phase I. This cell completed construction in 2021 and was built with an underdrain system, composite liner, and leachate collection system. W-3, Phase II was constructed in 2023. This area includes the remaining cell floor and an abutment liner on the north slope of W-1 was installed in 2023. This expansion was approved by IDNR 01/16/2024. Filling is expected to begin at the end of January. Cell W-3 is the active area.

Asbestos Cell No. 1 was developed from 1992 to 2008 and is closed. It was constructed with a clay liner but without an underdrain or leachate collection system.

Asbestos Cell No. 2 was opened in 2008 and is currently active. It was constructed above the water table and consequently without an underdrain system. It has a clay liner and leachate collection system.

Areas A and C have passive landfill gas venting systems in place. An active landfill gas system (GCCS) was installed in the Summer of 2023 in Area E, Cell X, Cell W-1, Cell W-2 and Cell W-3. The GCCS includes deep gas extraction wells in E, X, W-1 and W-2, horizontal gas extraction wells in W-3, flare and a gas to energy plant. The Landfill gas venting is not required for Asbestos Cell No. 1 and Asbestos Cell No. 2.

1.2 Black Hawk County Geology and Hydrogeology

The subsurface geologic formations encountered during installation of site wells at the Black Hawk County Landfill are included on the boring logs and monitoring well/piezometer documentation forms (Iowa DNR Form 542-1277) presented in Appendix A of the HMSP. Boring and well locations are shown on HMSP Figure 2-2. The site geology and hydrogeology of the Black Hawk County Landfill has been comprehensively investigated in several studies, including the Black Hawk County Landfill Phase I Site Investigation and Monitoring Well Installation Program (SIMWIP) (Brice, Petrides-Donohue, 1987), and the Hydrologic Investigation Report for Landfill Expansion, Black Hawk County Landfill (Rust Environment & Infrastructure, 1997), and will be summarized here.

The Black Hawk County Landfill is situated in the Iowan Surface region of northeastern Iowa. The Iowan Surface (Prior, 1991) was glaciated several times during Pre-Illinoian-age glacial episodes leaving behind a sequence of glacial deposits that overlies bedrock. During the last glacial episode, the Wisconsin Episode, the Iowan Surface was subject to extensive erosion that has left a generally low-relief landscape with long, subtly stepped slopes.

In uplands, a relatively thin veneer of Wisconsin Episode loess and hillslope sediment mantles the Pre-Illinoian-age glacial sequence. In drainageways, Wisconsin episode and younger Holocene episode alluvium mantle the Pre-Illinoian-age glacial sequence. In borings completed at the Black Hawk County Landfill, the loess, hillslope, and alluvial sediments range from 0 to as much as 24 feet thick for the thickest alluvial deposits.

These surficial deposits overlie a thick sequence of Pre-Illinoian-age glacial deposits composed predominantly of fine-grained glacial diamictons (“tills”). At the Black Hawk County Landfill, the Pre-Illinoian-age glacial sequence includes deposits from three separate glacial advances. Deposits from the youngest Pre-Illinoian-age glacial advance are included in the Wolf Creek Formation and are designated as QWT at the site. The underlying deposits are from two older Pre-Illinoian-age glacial advances that are included in the Alburnett Formation and are designated QAT and the underlying QBT at the site.

The Wolf Creek Formation, QWT, occurs in the higher elevation summit areas at the landfill. Downslope, the Wolf Creek deposits are thin or are absent because of erosion during development of the Iowan Surface. At lower elevations at the site, the youngest Alburnett Formation deposits, QAT, locally form the surficial Pre-Illinoian-age glacial deposits because the Wolf Creek Formation deposits have been eroded away. The oldest Alburnett Formation deposits, QBT, occur only in the subsurface beneath QAT deposits.

The Pre-Illinoian-age glacial diamictons, QWT, QAT, and QBT, are all generally similar, fine-grained, low hydraulic conductivity deposits. Boundaries between the units at the Black Hawk County Landfill are marked by a variety of features, including unconformities, weathering zone changes, and discontinuous meltwater deposits. Discontinuous lenses of meltwater deposits also occur infrequently within the diamictons of the three separate glacial advances. However, the limited occurrence and the isolated, discontinuous distribution of these meltwater deposits within the thick, fine-grained glacial sequence result in groundwater flow being controlled by the flow in the surrounding fine-grained Pre-Illinoian-age glacial diamictons.

Groundwater travel times in the glacial diamictons at Black Hawk County Landfill are low, on the order of feet per year (ft/yr.). Hydrogeologic studies by Donohue (1989; 1990) calculated the groundwater flow velocity using hydraulic gradients from water elevations in site wells and hydraulic conductivity data from both laboratory tests of site samples and slug tests of site wells. The calculated groundwater flow velocity was approximately 0.7 ft/yr.

A study of hydrogen isotopes (tritium) in site groundwater confirmed the low flow velocity. In shallow wells, a tritium isotope study indicated a velocity of 1.12 ft/yr., and in intermediate depth wells, the groundwater velocity was 0.92 ft/yr., both very similar to the calculated groundwater velocity of 0.7 ft/yr.

The bedrock surface beneath the Quaternary sediments at the Black Hawk County Landfill has low relief and undulates over a range of about 35 feet in elevation, with a north-south trending high near the center of the site (HMSP Figure 2-3). Top of bedrock elevations range from about 825 to 855 feet above MSL. The uppermost bedrock is thick Devonian-age Cedar Valley Group dolomite that ranges from about 120 to 160 feet thick at the site and forms the uppermost aquifer beneath the landfill.

The Cedar Valley Group at the site is underlain by an aquitard composed of sandy conglomeratic shales of the Kenwood Member of the Devonian-age Wapsipinicon Group. The Kenwood Member is reported to be between 18 to 29 feet thick in borings drilled at the site.

Underlying the Kenwood Member is a thick sequence of Silurian-age dolomite that is on the order of 120 to 135 feet thick. Below the Silurian-age dolomite in the deepest boring at the site, B-200, Ordovician-age Maquoketa Formation was encountered at a depth of over 420 feet.

1.2.1 Water Table

The water table at the Black Hawk County Landfill is shallow and occurs in the Quaternary-age sediments. Figure 3 presents the water table in March 2024 which is representative of current water table conditions at the site. The water table attains its highest elevations both north and south of Cells W-1, W-2, and W-3 with a groundwater divide occurring through Cells W-1 and W-3, west of the area where Neutral Trench, Area A and the western part of Area C are located.

Natural water table elevations range from a high of approximately 951.94 feet MSL at MW-319B along the south-central portion of the site and to a low of 891.21 feet MSL at OW-118B east of the Co-Disposal Area. Water table elevations decline from the groundwater divide across the central part of the site in the vicinity of Cells W-1 and W-2 to approximately 918.39 feet at MW-304B in the northwestern corner of the site along a drainageway that is tributary to Sink Creek.

With the construction of groundwater underdrain systems beneath Area E, Cell X, and Cell W-1, Cell W-2, and Cell W-3, the water table is locally lowered artificially by groundwater drainage layers, and there are steep inward (downward) water table gradients to each of those groundwater underdrain systems. Figure 3 displays the effect of Cell W-1 groundwater drainage layer between Areas A and C and Cell W-1.

1.2.2 Intermediate Groundwater Elevations

A map showing March 2024 groundwater elevations for intermediate wells is presented as Figure 4. This map was not contoured because these wells are screened in discontinuous sand and silt lenses within the

glacial till, which occur at various depths beneath the water table. The intermediate depth wells were installed to monitor vertical hydraulic gradients and groundwater quality.

1.2.3 Piezometric Surface in the Uppermost Bedrock

The piezometric surface in the Cedar Valley Group at the site in March 2024 is shown on Figure 5 and is representative of the current piezometric surface in the uppermost bedrock. Flow in the Cedar Valley Group is east-northeast over most of the site. The Cedar Valley Group dolomite is an aquifer, and piezometric surface elevations vary over a narrow range from approximately 837.36 to 827.20 feet MSL. The distinct difference in elevations and flow directions between the water table in the Quaternary sediments (Figure 3), the intermediate wells (Figure 4) and the piezometric surface in the Cedar Valley Group dolomite (Figure 5) indicates that the vertical gradient through the Pre-Illinoian-age glacial diamicton is strongly downward toward the Cedar Valley Group. Vertical groundwater flow is approximately 1-ft/year downward from the water table to the bedrock aquifer.

1.3 Summary of Hydrologic Monitoring System Plan (HMSP)

Groundwater monitoring at the Black Hawk County Landfill includes monitoring of the water table in the surficial Quaternary-age sediments which acts as an aquitard and the uppermost aquifer in the Devonian-age Cedar Valley Group dolomite bedrock.

1.3.1 Water Table and Underdrain Monitoring Points

The wells comprising the water table and underdrain sampling program for the Black Hawk County Landfill are listed on Table 1 and include the following wells and underdrain sampling points shown on Figure 1. The upgradient and downgradient positions of the wells within the shallow (water table) groundwater flow system for each monitored solid waste unit is based on groundwater flow depicted on Figure 3. The following narrative describes monitoring wells related to each solid waste unit.

Site-wide Background Water Table Monitoring includes:

- Wells OW-101B, OW-114B, OW-213BR, OW-216BR, OW-217B, OW-218B, OW-219B, MW-304B, MW-308B, MW-319B, OW-403B, OW-405B, MW-701B, MW-702B, MW-703B, MW-704B, MW-705B, MW-706B, MW-707B, MW-708B, MW-709B and MW-710B serve as the shallow background monitoring points for Landfill Areas A, C and E, Cells X, W1, W2, W3 and W4; these wells are screened in Quaternary Loess and Pre-Illinoian glacial diamicton (till).

Area A — Water table monitoring includes:

- Downgradient water table monitoring is defined by several wells that differ in the hydrostratigraphy of their well screen intervals. These include water table wells OW-401B completed in Quaternary loess and the underlying Pre-Illinoian-age Wolf Creek Formation, OW-410B and OW-411B both completed in Quaternary loess and the underlying Wolf Creek and Alburnett Formation glacial deposits, and MW-501B, completed in Quaternary loess and the underlying Wolf Creek and Alburnett Formation glacial deposits.
- Water table measurement only wells (EPA Permit) include downgradient water table well OW-106B Pre-Illinoian-age Alburnett Formation glacial deposits, OW-117B Pre-Illinoian-age Alburnett Formation glacial deposits, OW-107BR completed in Pre-Illinoian-age Alburnett Formation glacial deposits, OW-116B Pre-Illinoian-age Alburnett Formation glacial deposits, and OW-108B completed in Pre-Illinoian-age Wolf Creek Formation glacial deposits.

Area C — Water table monitoring includes:

-
- Downgradient water table monitoring wells include several wells that differ in the hydrostratigraphy of their well screen intervals. The water table wells include OW-105B completed in Pre-Illinoian-age Alburnett Formation glacial deposits completed in Alburnett Formation glacial deposits; OW-

205B completed in Quaternary loess and the underlying Wolf Creek and Alburnett Formation glacial deposits, OW-220B completed in Pre-Illinoian-age Alburnett Formation glacial deposits; wells OW-224B, OW-225B, OW-226B and OW-227B completed in Quaternary loess and the underlying Wolf Creek and Alburnett Formation glacial deposits; well OW-402B completed in Quaternary loess and the underlying Wolf Creek and Alburnett Formation glacial deposits; and wells OW-412B and OW-414B completed in underlying Wolf Creek and Alburnett Formation glacial deposits.

Area E — Water table monitoring, and the underdrain outlets include:

- Downgradient groundwater underdrain outlets GUE-1 and GUE-2.
- Downgradient water table monitoring wells are OW-113B completed in Pre-Illinoian-age Alburnett Formation glacial deposits, OW-409B completed in Quaternary loess and the underlying Pre-Illinoian-age Wolf Creek Formation glacial deposits, and OW-212B completed in Pre-Illinoian-age Alburnett Formation glacial deposits.
- Water table measurement only wells include several upgradient wells that differ in their well screen geology. The wells include OW-218B completed in Pre-Illinoian-age Wolf Creek Formation and underlying Alburnett Formation glacial deposits and OW-101B, OW-102B, OW-102D, OW-103B, and OW-104B completed in Pre-Illinoian-age Alburnett Formation deposits.

Cell X — Water table monitoring, and the underdrain outlet includes:

- Downgradient groundwater underdrain outlet GUX-1.
- Downgradient water table monitoring includes OW-209B, OW-221B, OW-222B, and OW-223B completed in Pre-Illinoian-age Alburnett Formation glacial deposits.
- Water table measurement only wells include upgradient water table wells that differ in the geology of their well screen intervals. The wells include OW-105B, OW-107BR, OW-113B, OW-214BR, and OW-215BR completed in Pre-Illinoian-age Alburnett Formation glacial deposits.

Cells W-1/W-2 — Water table monitoring, and the underdrain outlet includes:

- Currently closed and are located east and west of the water table divide at the Black Hawk County Landfill.
- Downgradient underdrain outlets GUW1-1 and GUW2-1.
- Downgradient water table wells MW-602B, MW-603B, and MW-604B completed in Pre-Illinoian-age Wolf Creek Formation and the underlying Alburnett Formation glacial deposits.
- Water table measurement only wells related to Cells W-1/W-2 include various wells that differ in the geology of their well screen interval. Upgradient water level measurement only wells include OW-407B, OW-408B and OW-606B where the well screens are set in the Pre-Illinoian-age Wolf Creek Formation and the underlying Alburnett Formation glacial deposits. Sidegradient water level measurement wells include MW-318BR and MW-701B completed in the Pre-Illinoian-age Wolf Creek Formation glacial deposits and MW-320B completed in Pre-Illinoian-age Wolf Creek Formation and underlying Alburnett Formation glacial deposits.

Cell W-3 — Water table monitoring, and the underdrain outlet includes:

- Currently operating, transecting the water table divide at the Black Hawk County Landfill.
- Downgradient underdrain outlet GUW3-1.
- Downgradient water table wells OW-101B, MW-711B and MW-712B completed in Pre-Illinoian-age Wolf Creek Formation and the underlying Alburnett Formation glacial deposits.
- Water table measurement only wells related to Cells W-3/W-4 include various wells that differ in the geology of their well screen interval. Sidegradient water level measurement wells include MW-701B, MW-702B, MW-703B, MW-704B, MW-705B, MW-706B, MW-707B, MW-708B and MW-304B completed in the Pre-Illinoian-age Wolf Creek Formation glacial deposits.

Asbestos Cell No. 1 — Water table monitoring includes:

- Downgradient water table monitoring well MW-409B completed in Quaternary loess and the underlying Pre-Illinoian-age Wolf Creek Formation glacial deposits.
- Water table measurement only wells include various wells that differ in the geology of their well screen interval. Upgradient water table wells include OW-101B and OW-102B completed in Pre-Illinoian-age Alburnett Formation glacial deposits. Sidegradient water table wells include OW-103B and OW-104B completed in Pre-Illinoian-age Alburnett Formation glacial deposits. Downgradient water table measurement only is completed in water table well OW-102D completed in Pre-Illinoian Alburnett Formation glacial deposits.

Asbestos Cell No. 2 — Water table monitoring includes:

- Currently active.
- Downgradient water table monitoring well MW-409B completed in Quaternary loess and the underlying Pre-Illinoian-age Wolf Creek Formation glacial deposits.
- Water table measurement only wells include various wells that differ in the geology of their well screen intervals. Upgradient water table measurement only wells include OW-101B, OW-102B, and OW-102D completed in the Pre-Illinoian-age Alburnett Formation glacial deposits. Sidegradient water table measurement only wells include OW-103B and OW-104B completed in Pre-Illinoian Alburnett Formation glacial deposits.

1.3.2 Bedrock Monitoring Points

The wells comprising the uppermost bedrock monitoring program for all the waste disposal areas at the Black Hawk County Landfill are listed on Table 1 and include the following monitoring wells shown on Figure 1. The upgradient and downgradient positions of the wells within the bedrock aquifer (deep) groundwater flow system for each monitored solid waste unit is based on groundwater flow depicted on Figure 5. All the wells are completed in the uppermost bedrock aquifer beneath the facility, the Devonian-age Cedar Valley Group dolomite.

The 6 detection monitoring wells completed in the uppermost bedrock include:

- Deep monitoring well P-604C upgradient of the entire facility.
- Deep monitoring well P-703C upgradient of the entire facility
- Deep monitoring well MW-318CR upgradient of the entire facility
- Deep monitoring well P-213C downgradient Cell W-3, sidegradient of Area E and upgradient Cell X.
- Deep monitoring well P-214CR downgradient of Cell W-1, Cell W-2, Cell W-3, Area A, Area C, and Cell X.
- Deep monitoring well P-215CR downgradient of Area C, Area E, Cell W-1, Cell W-2, Cell W-3, and Cell X.
- Deep monitoring well P-216CR downgradient of Area E, Cell W-1, Cell W-2, Cell W-3, and Cell X.

The water level measurement only wells completed in the uppermost Devonian-age Cedar Valley Group dolomite bedrock include:

- Deep well P-101C downgradient of Cell W-3, sidegradient of Cell W-1 and upgradient of Asbestos Cell No. 1.
- Deep well P-102C downgradient of Cell W-3, sidegradient of Cell W-1 and downgradient Asbestos Cell No. 1.
- Deep well downgradient of Cell W-3, P-103C sidegradient of Cell W-1, downgradient Asbestos Cell No. 1, and upgradient Asbestos Cell No. 2.
- Deep wells P-106C and P-107C downgradient of Cell W-1 and Area C, and upgradient of Cell X.
- Deep wells P-108C and P-109C downgradient of Cell W-1 and Area A.
- Deep wells P-110C and P-111C sidegradient to the entire facility.
- Deep monitoring well P-114C upgradient of Area A

- Deep monitoring well P-402C upgradient of Area A and downgradient of Cell W-1
- Deep monitoring well downgradient of Cell W-3, P-104C upgradient of Area E
- Deep monitoring well P-105C downgradient of Cell W-1 and Area A
- Deep monitoring well P-113C downgradient of Area C

1.3.3 Changes or Deviations to HMSP for 2024 Monitoring

Refer to 2025 HMSP for changes submitted JANUARY 2025.

The monitoring wells comprising the water-table and bedrock, and landfill cells underdrains for the 2024 sampling program for the Black Hawk County Landfill are listed on Table 1 and are shown on Figure 1.

1.3.4 Current Site Map

The Landfill location in Black Hawk County and site map showing the current monitoring system is shown in Figure 1. Groundwater level only monitoring wells are shown on Figure 2.

1.3.5 Current Groundwater Contour Maps

Groundwater is monitored in three water-bearing units: 1) the shallow groundwater measured by the water table, 2) intermediate groundwater within localized, discontinuous sand and silt lenses encapsulated with the glacial diamicton sequence, and 3) deep groundwater measured by the potentiometric surface of the Devonian Cedar Valley Formation that is comprised of dolomitic limestone. Groundwater elevations for March and September 2024 are summarized in Table 4.

1.3.5.1 Water Table Groundwater Flow

The water table within the Quaternary deposits occurs within the thin surficial loess, alluvium and colluvium, and the underlying Wolf Creek Formation and Alburnett Formation glacial diamictons.

Figure 3 shows the March 2024 water table at the site. The water table is shallow, and gradients are primarily downward to bedrock through a sequence of fine-grained sediments composed of thin surficial loess, alluvium, and colluvium, and the underlying thick glacial diamicton sequence.

Prior to Landfill construction, the water table surface mimicked the ground surface contours with a north-south trending groundwater divide in the central area of the site, and with declining water table elevations to the southeast and northwest. During landfill construction, landfill base grades have been excavated below the water table at Area E, Cell X, and Cells W-1, W-2 and W-3, locally changing water table flow and lateral gradients. The present water table follows a pattern similar to pre-Landfill construction conditions, with a north-south trending water table divide in the central area of the site and declining elevations to the east and west; but Landfill excavation and installation of groundwater underdrain systems have altered water table flow and result in locally lowered water table elevations.

1.3.5.2 Intermediate Groundwater Flow

Intermediate wells were removed from the detection monitoring system in accordance with IDNR Permit Modification 2 (May 2001) and were retained for water level monitoring only. The intermediate wells were retained to monitor vertical groundwater flow and vertical hydraulic gradients. Figure 4 shows the intermediate well locations with water elevations obtained in March 2024. A contour map is not presented for these wells because they are screened in different localized, discontinuous sand and silt lenses within the glacial sequence. These lenses occur at various depths beneath the water table and do not form a single hydrostratigraphic unit.

1.3.5.3 Deep Groundwater Flow

Figure 5 presents the March 2024 potentiometric surface within the Cedar Valley Formation. The potentiometric surface is generally low and uniform across the site. The surface is consistent with previous

years, showing the direction of groundwater movement in the east-northeast direction. Hydraulic gradients are consistent with past years' maps.

Thus, the designated upgradient wells are adequately monitoring upgradient groundwater, and designated downgradient wells are monitoring downgradient groundwater.

1.4 Monitoring Well Maintenance and Performance Re-Evaluation Plan

The evaluation of water levels and their relationship to the well screen interval was completed throughout the year to comply with IAC 567-113.10(455B)(2)f(2). As part of this evaluation, screen depths were verified and reviewed to determine whether they are properly placed with respect to groundwater levels. To comply with IAC 567-113.10(455B)(2)(3), changes to depth-to-bottom readings were also evaluated to determine if sedimentation over time has occurred. Table 3 presents the monitoring well maintenance and performance evaluation schedule. Table 4 presents a summary of monitoring well levels and changes in recharge rates. Monitoring well inspection of the wells can be found in Appendix G.

Starting with the 2018 landfill monitoring events, the measurement of well recharge rates was initiated through use of recorded flow rates, post-sampling groundwater level recovery rates and the slug test method.

Monitoring wells at Black Hawk County Landfill occur in three separate hydrostratigraphic units: shallow (water table), intermediate, and deep (bedrock). As noted in the HMSP, there are 23 intermediate, 64 shallow, and 21 deep monitoring wells installed at the Landfill. Each of these hydrostratigraphic units has different hydraulic conductivities. An update on slug tests and well recharge rates will be presented in the 2025 AWQR.

Low-flow sampling was utilized during all 2024 sampling events. As part of low-flow sampling, stabilization data, including flow rate ml/min), groundwater level, redox potential (+/-10mv), pH (+/-10%), conductivity (+/-10%), turbidity (less than 5 NTU) and dissolved oxygen (+/-10%) parameters were monitored and provide information on changes in well chemistry and well groundwater flow. These parameters are measured using an In-Situ Aqua Troll 500 equipped with multiple water quality sensors. Low-flow sampling data for the shallow and deep wells, and groundwater layer discharge points are included in Appendix C. Calibration information is also included in Appendix C. The 2024 high and low groundwater level measurements and well depth-to-bottom readings are included in Table 4.

Annually, each well is inspected during two site-wide groundwater level measurement events for the following information:

- Condition of guard posts
- Condition of surface seal
- Condition of protective casing
- Well security
- Well cap condition
- Presence of water in protective casing
- Biological hazards (i.e., wasp nest)
- Condition of well casing
- Obstructions or bends in well casing
- Sediment in well bottom

Inspection notes are made on field forms. In addition, wells are photographed to document condition of monitoring well. Based on inspection results, maintenance is scheduled for each well which requires repairs. The monitoring well maintenance and performance re-evaluation was completed in 2024, as noted in Table 3. Overall, the monitoring wells are in good operating condition with no changes in groundwater flow rate or stabilization parameters. The data indicates no measurable degradation of the monitoring wells occurred in 2024. The next monitoring well condition assessment report will be submitted in 2025 AWQR.

2. Reporting Period Monitoring Activities

2.1 Current Detection Monitoring Activities for 2024

The detection monitoring program for the Black Hawk County Landfill has been established in accordance with the IDNR regulations in 567-113.10(5). The existing detection monitoring system consists of 47 monitoring points, including 35 shallow (water table) wells:

OW-101B	OW-105B	OW-113B	OW-114B	OW-205B	OW-209B
OW-212B	OW-213BR	OW-216BR		OW-219B	OW-220B
OW-221B	OW-222B	OW-223B	OW-224B	OW-225B	OW-226B
OW-227B	MW-319B	OW-401B	OW-402B	MW-409B	OW-410B
OW-411B	OW-412B	OW-413B	OW-414B	OW-501B	MW-602B
MW-603B	MW-604B	MW-709B	MW-710B	MW-711B	MW-712B

6 deeper wells in the uppermost bedrock:

P-213C	P-214CR	P-215CR	P-216CR	P-604C	P-703C

and 5 groundwater underdrain monitoring locations:

GUE-2	GUX-1	GUW1-1	GUW2-1	GUW3-1

A summary of the hydrologic monitoring system is provided in Table 1. Locations of detection monitoring points are shown on Figure 1.

Table 5 presents the background and GWPS summary for the shallow and deep detection monitoring wells. Table 6 presents a summary of monitoring points (groundwater wells and groundwater underdrain outlets) with detected constituent pairs for the detection monitoring locations. Appendix B presents historical summary tables for all detection monitoring locations.

2.2 Current Assessment Monitoring Activities

Currently, there are 19 wells with ongoing and newly identified statistically significant increases (SSIs). Monitoring wells OW-113B, OW-205B, OW-212B, OW-220B, OW-221B, OW-222B, OW-223B, OW-224B, OW-225B, OW-226B, OW-227B, OW-401B, OW-402B, MW-409B, OW-410B, OW-411B, OW-412B, OW-414B, and P-213C have exceedances for metals (Table 7). Wells OW-220B, OW-221B, OW-224B, OW-225B, OW-226B, OW-227B, OW-401B, OW-402B, OW-410B, OW-412B, and OW-414B have exceedances for organic compounds. At these assessment wells, comparisons to the appropriate statewide standards for a protected groundwater source were performed using either a parametric or a nonparametric confidence interval and 2024 results were also compared to both interwell and intrawell background values for trends. The groundwater protection standards used in the comparisons were obtained from the IDNR web site at:

https://programs.iowadnr.gov/riskcalc/Home/statewidestandards.

Groundwater underdrains GUE-2, GUX-1, GUW2-1, and GUW3-1 have a few organics detected and few GPS exceedances for metals. Water collected from all groundwater underdrains is being discharged to the site leachate collection system. Groundwater underdrain GUW1-1 could not be sampled in 2024 due to access restrictions and pump not working. Tables 7 and 8 present a summary of ongoing and newly identified SSIs and a summary of historic SSIs and SSLs. Wells OW-105B, OW-114B, OW-205B, OW-220B, OW-224B, OW-225B, OW-226B, OW-227B, OW-401B, OW-402B, OW-410B, OW-411B, OW-412B, OW-413B, OW-414B, P-402A, and P-402C are part of an ongoing assessment of corrective measures (ACM) and are discussed in a separate 2024 ACM report submitted in January 2025.

3. Data Evaluation and Summary

Water Quality

A system of groundwater monitoring wells and groundwater underdrain outlets monitor water quality at the Landfill. These sampling points are shown on Figure 1. Table 1 presents a summary of information on each monitoring point.

Statistical Analysis

Samples from the monitoring points were analyzed for IDNR Appendix I parameters. Several wells (OW-205B, OW-401B, OW-402B, and MW-409B) have been in assessment monitoring and have been analyzed for IDNR Appendix II parameters at least four times during 2009 through 2024. In addition, analyses of dissolved Appendix I metals were performed during 2007 through 2013. Beginning with the fall 2014 sampling event, all samples that included total metals analyses were also tested for total suspended solids (TSS) in the laboratory, and turbidity as measured by both field and laboratory methods. With changes directed by IDNR and advent of TSS and field turbidity, only total metals are tested at Black Hawk County Landfill since 2014.

Summary tables B-1, B-2 and B-3 presented in Appendix B present the historical analytical results for each sampling point from October 2007 through the beginning of 2025. The minimum detection levels for many analytes have varied between the older and more recent sampling events. This may be partially a result of a change in the laboratory testing procedures for these analytes. An additional factor in the change in detection limits is, that beginning in October 2011, all results are reported to the method detection limit. The affected data points were not adjusted for the statistical analyses.

Historical metals parameters data outliers, present in the past background datasets, are assumed attributable to sampling techniques which did not minimize turbidity during sampling. Beginning with the fall 2014 sampling event, precise low-flow sampling techniques were instituted, and qualitatively, reduced total suspended solids and turbidity have been observed.

Because of these factors, in fall 2016, the background datasets for the shallow and bedrock hydrostratigraphic units were re-evaluated to retain data that better represents samples obtained using current sampling methods and using results reported to the method detection limit. It was determined that by excluding upgradient background data obtained prior to fall 2014, the goal of representative background datasets could be achieved; and therefore, the datasets used for interwell comparisons span the period from 2014 through the end of 2023. Table 5 presents a summary of background and GWPS values for the shallow (water table) and deep (bedrock aquifer) groundwater monitoring zones for 2024 interwell comparisons. Background datasets used for 2024 and 2025 interwell comparisons will also span the period from fall 2014 through the end of 2023. Background datasets used for 2026 interwell comparisons will be updated to span the period from 2014 through the end of 2025. Table 5 provides a summary of background data, statistical test results and estimated prediction limits.

Prior to statistical analysis, the background data for parameters with less than 50 percent non-detections were examined to determine whether they were normally distributed. No tests were conducted to detect results that are artificially high or low (outliers) due to field, transportation, laboratory, or transcription error. Past testing has indicated that although some background data points meet the statistical criteria to be outliers, no justification could be found to remove them from the background data, and they remained as part of the background data. No trend testing was conducted.

Background levels of parameters detected in 2024 were established by pooling all available historical data from the upgradient wells from fall 2014 through 2023 (refer to Tables 1 and 5 for upgradient well list). For the detection monitoring program, compliance well data were statistically tested against the background data using interwell prediction limit methods. Such tests were conducted only for compliance well results noted at or above the reporting limit. The procedure used to determine the appropriate prediction limit method was as follows:

1. If background for a given parameter contained more than 50 percent non-detects, a nonparametric prediction limit was used to test the compliance data against upgradient background, and the method detection limit (MDL) was used for non-detect values to account for non-detects. An NPL is defined as maximum detected value, or MDL if 100 percent ND.

2. If background for a given parameter contained between 20 percent and 50 percent non-detects, Cohen's adjustment was used to account for non-detect values. If background for a given parameter contained less than 20 percent non-detects, one-half of the MDL was used to account for non-detect values.

3. If background for a given parameter contained less than 50 percent non-detects, the background data were tested for lognormality and normality using the Shapiro-Wilk procedure and probability plots. If background data for a given parameter were not found lognormal or normal in statistical distribution (defined as a significant result for the Shapiro-Wilk procedure at a 95 Percent Confidence Level), a distribution-free prediction limit (99 Percent Confidence Level) was used to test the compliance well data against background.

4. If background for a given parameter was lognormal or normal (defined as a non-significant result for the Shapiro-Wilk method at a 95 Percent Confidence Level) and contained less than 50 percent non-detects, a parametric prediction limit (USEPA Unified Guidance 99% Confidence One-Sided) was used to test the compliance data against background.

5. If background data for a given parameter were neither lognormal nor normal in statistical distribution (defined as a significant result for the Shapiro-Wilk procedure at a 95 percent confidence level) and contained less than 50 percent non-detects, a distribution-free prediction limit (99 percent confidence level) was used to test the compliance well data against background. Table 6 presents a background and GWPS summary.

Interwell comparisons were not conducted for detected downgradient analytes with estimated (J-flagged) concentrations.

A pass 1-of-2 verification resampling scheme was utilized for wells which statistically exceeded the background prediction limit. For current year compliance data, an exceedance of the appropriate interwell prediction limit for a given Appendix I inorganic constituent, or the reporting limit (RL) for an organic compound, triggered a retest for that constituent within 90 days of the original sampling date. If the retest results also exceeded the prediction limit or an organic RL, a statistically significant increase (SSI) over background levels at that well was considered to have occurred. If it could not be demonstrated that a source other than a landfill unit caused the contamination or that the SSI resulted from error in sampling, analysis, statistical evaluation, or natural variation in groundwater quality, the well then entered assessment monitoring.

3.1 Detection, Assessment, and Corrective Measures Monitoring

The Spring 2024 semi-annual sampling event commenced on April 23, 2024, and was completed on May 23, 2024. AECOM received the last of the laboratory data on June 10, 2024; and statistical analyses were completed on July 13, 2024.

The Fall 2024 semi-annual event commenced on September 25, 2024, and was completed on October 30, 2024. AECOM received the last of the laboratory data on November 12, 2024; and statistical analyses were completed on January 8, 2025.

Two re-sampling events were completed: July/August 2024 and January 2025. These events were completed to confirm or reject SSIs and/or GWPS exceedances.

Sample turbidity measurements using field methods were recorded for all low-flow samples. All groundwater samples were analyzed for total suspended solids (TSS) by Eurofins lab. Field turbidity and TSS measurements were also recorded for the groundwater underdrain outlet samples.

Table 6 provides a summary of wells with the Appendix I parameters detected in the results for the spring semi-annual, August re-sample, fall semi-annual sampling 2024 events and January 2025 re-sampling event. The results of the interwell compliance to background comparisons are also presented in Table 6.

Wells OW-101B, OW-114B, OW-213BR, OW-216BR, OW-217B, OW-218B, OW-219B, MW-304B, MW-308B, MW-319B, OW-403B, OW-405B, MW-701B, MW-702B, MW-703B, MW-704B, MW-705B, MW-706B, MW-707B, MW-708B, MW-709B and MW-710B serve as the shallow background monitoring points for Landfill Areas A, C and E, Cells X, W1, W2, W3 and W4.
(Table 5). Samples from monitoring wells MW-318CR, P-604C, and P-703C were used to represent deep groundwater in the underlying bedrock. These wells serve as the basis of comparison to determine the impact the Landfill may have on water quality.

J-flagged organic detections in the shallow and deep upgradient wells occurred very rarely in 2024.

3.1.1 Detection Monitoring

Downgradient Monitoring Points

Comparisons between downgradient sampling points and their upgradient counterparts are intended to detect any possible impact from the Landfill on water quality downgradient of the Landfill. Upgradient and downgradient sampling points are sampled concurrently.

Shallow Monitoring Points

Monitoring wells OW-105B, OW-113B, OW-205B, OW-209B, OW-212B, OW-220B, OW-221B, OW-222B, OW-223B, OW-224B, OW-225B, OW-226B, OW-227B, OW-401B, OW-402B, MW-409B, OW-410B, OW-411B, OW-412B, OW-413B, OW-414B, and MW-501B, and underdrain outlets GUE-2 and GUX-1 are located and screened to intercept shallow groundwater in the eastern part of the Landfill monitoring closed landfill cells Area A, Area C, Area E, Cell X, and Asbestos Cell 1.

Monitoring wells MW-602B, MW-603B, and MW-604B, underdrains GUW1-1 and GUW2-1 are located and screened to intercept shallow groundwater in the western part of the Landfill monitoring Cells W-1 and W-2.

Monitoring wells MW-711B, and MW-712B, and underdrain outlet GUW3-1 are located and screened to intercept shallow groundwater in the eastern and western parts of the Landfill monitoring currently active Cell W-3.

Table 6 presents the results of the interwell comparisons for all inorganic parameters detected in the shallow downgradient detection monitoring points not currently in assessment monitoring.

OW-101B:
Shallow well OW-101B had no verified prediction limit or GPS exceedances for Spring and Fall 2024.

OW-105B:
Shallow well OW-105B had no verified prediction limit or GPS exceedances for Spring and Fall 2024.

MW-501B:
Shallow well MW-501B had no verified prediction limit or GPS exceedances for Spring and Fall 2024.

OW-209B:
Shallow well OW-209B had no verified prediction limit or GPS exceedances for Spring and Fall 2024.

MW-602B:
Shallow well MW-602B had no verified prediction limit or GPS exceedances for Spring and Fall 2024.

MW-603B:
Shallow well MW-603B had no verified prediction limit or GPS exceedances for Spring and Fall 2024.

MW-604B:
Shallow well MW-604B had no verified prediction limit or GPS exceedances for Spring and Fall 2024.

MW-711B:
Shallow well MW-711B had no verified prediction limit or GPS exceedances for Spring and Fall 2024.

MW-712B:
Shallow well MW-712B had no verified prediction limit or GPS exceedances for Spring and Fall 2024.

Bedrock Monitoring Points

P-214CR:
Deep well P-214C had no verified prediction limit or GPS exceedances for Spring and Fall 2024.

P-215CR:
Deep well P-215C had no verified prediction limit or GPS exceedances for Spring and Fall 2024.

P-216CR:
Deep well P-216C had no verified prediction limit or GPS exceedances for Spring and Fall 2024.

Underdrain Monitoring Points

GUE-2:
Monitoring point GUE-2 had detections of arsenic, barium, cobalt, and nickel, all below corresponding GPSs. Appendix I organic detections included benzene and cis-1,2-Dichloroethylene. The GUE-2 effluent will continue to be diverted to the BHCL leachate gravity sewer through 2025, according to the approved GUE-2 ACM.

GUW1-1:
GUW1-1 was not sampled in 2024 due to limited access during the construction of MSW Cell W-3, Phase II.

GUW2-1:
Monitoring point GUW2-1 had detections of arsenic, barium and cobalt during Spring and Fall 2024. There were no Appendix I organic detections. The GUW2-1 effluent will continue to be diverted to the western drainage ditch.

GUX-1 (includes GUE-1):
Monitoring point GUX-1 had detections of barium which were below corresponding GPS. There were no Appendix I organic detections for Spring and Fall 2024.

GUW3-1:
Monitoring point GUW3-1 had detections of arsenic, barium, cobalt, copper, nickel, and thallium, for Spring and Fall 2024. There were no Appendix I organic detections. The GUW3-1 effluent is diverted to the eastern drainage ditch.

3.1.2 Assessment Monitoring

Assessment Points

Tables 7 and 8 present a summary of ongoing and newly identified SSIs and SSLs detected in 2024 at assessment monitoring locations OW-113B, OW-212B, OW-221B, OW-222B, OW-223B, MW-409B, and P-213C. Tables 7 and 8 also include background interwell prediction limits, lower confidence limits (LCL), upper confidence limits (UCL), GWPSs, initial exceedance, resampling, and background sample dates.

Analyses were done only for analytes with at least one quantified detection above the respective reporting limits.

As previously stated, wells OW-205B, OW-220B, OW-224B, OW-225B, OW-226B, OW-227B, OW-401B, OW-402B, OW-410B, OW-411B, OW-412B, OW-413B, AND OW-414B are being investigated as part of the ACM for Areas A and C which began in 2016. Results for these wells are discussed in a separate report submitted in January 2025.

OW-113B:
An exceedance of the cobalt prediction limit and the cobalt site-specific GPS of 9.83 µg/L occurred in Spring and Fall 2024 sampling. Well OW-113B, located east of Area C and south of Area E, was sampled for Appendix II in November 2022. Well OW-113B had no detected Appendix II only parameters in 2021 and 2022. The elevated cobalt at this location is considered naturally occurring. Site-specific limits are provided in an updated HMSP for 2025 monitoring.

This well will be sampled for Appendix II again in April 2027.

OW-212B:
An exceedance of the cobalt prediction limit and the site-specific cobalt GPS of 9.83 µg/L occurred in Spring and Fall 2024 sampling. The UCL is above the cobalt site-specific GPS of 9.83 µg/L, which indicates an SSL (Table 8).

Well OW-212B, located downgradient of Area E, was sampled for Appendix II in 2020, 2021 and 2022. Well OW-212B had no detected Appendix II only parameters in 2020, 2021 and 2022. The elevated cobalt at this location is considered naturally occurring. This well will be sampled for Appendix II again in Spring 2027.

OW-221B:
Results for monitoring well OW-221B show prediction limit exceedances for arsenic and barium during Spring and Fall 2024 sampling. The well also had an organic detection above RL for Benzene.

Monitoring well OW-221B was sampled for Appendix II in September 2020, October 2021, and October 2022. Well OW-221B had no detected Appendix II only parameters in 2020, 2021 and 2022. Arsenic and barium have been compliant for 3 years and are no longer considered SSLs (Table 8) but remain SSIs (Table 7). Cobalt currently remains an SSL until it has been compliant for 3 consecutive years (Table 8). This well will be sampled for Appendix II again in Spring 2027.

OW-222B:
Results for monitoring well OW-222B show no verified prediction limit or GPS exceedances during Spring and Fall 2024 sampling.

Cobalt currently remains an SSL until it has been compliant for 3 consecutive years (Table 8). Monitoring well OW-222B was sampled for Appendix II in October 2021 and October 2022. The well had no organic or non-Appendix I detections. This well will be sampled for Appendix II again in Spring 2027.

OW-223B:
Results for monitoring well OW-223B show no verified prediction limit or GPS exceedances during Spring and Fall 2024 sampling.

Monitoring well OW-223B was sampled for Appendix II in September 2020, October 2021 and October 2022. The well had no organic or non-Appendix I detections. Copper has been compliant for 3 years and is no longer considered an SSI or SSL (Table 8). This well will be sampled again for Appendix II again in Spring 2027.

MW-409B:
An exceedance of the cobalt prediction limit and the cobalt site-specific GPS of 9.83 µg/L occurred in Spring 2024 sampling, The Fall 2024 sampling result and LCL show cobalt below the site-specific GPS (Table 7). The UCL is above the cobalt site-specific GPS of 9.83 µg/L, which indicates an SSL (Table 8).

Well MW-409B, located downgradient of Area E, was initially placed in assessment monitoring in 2013 due to low level detections of benzene (<5 µg/L) in 2012. This well has been sampled for the full list of Appendix II constituents in 2013, 2014, 2015, 2016, 2017, 2018, 2019, 2020, 2021 and 2022. There have been no confirmed detections of Appendix II parameters, not in Appendix I, since 2013. There have been no confirmed detections of Appendix I organic parameters since 2013. The elevated cobalt level at this location is considered naturally occurring and, given no Appendix I or Appendix II organic detections, this well will remain in assessment monitoring with the next Appendix I sampling in Spring 2025.

This well will be sampled for Appendix II again in Spring 2027.

P-213C:
Bedrock well P-213C had a verified prediction limit or GPS exceedance for chromium in Fall 2024. This well is located sidegradient to Area E and is not located directly downgradient of Cells W-1 and W-2 or any other existing closed landfill cells. The Fall 2024 and January 2025 resampling results for chromium are above the current background prediction limit of 11.4034 µg/L, but below the GPS of 100 µg/L. The UCL for chromium remains below the GPS. Cobalt currently remains an SSL until it has been compliant for 3 consecutive years (Table 8).

This well was sampled for Appendix II in Spring 2024 and there were no detections for Appendix II only parameters. This well will remain in assessment monitoring with the next Appendix I sampling in Spring 2025. This well will be sampled for Appendix II again in Fall 2029.

Of all the assessment wells, exceedances of the groundwater protection standard (GPS) were noted for cobalt at shallow wells (Table 7) OW-113B, OW-212B, MW-409B and deep well P-213C; and for arsenic in shallow well OW-221B. Table 8 presents a qualitative summary of historic SSIs and SSLs for shallow wells OW-113B, OW-212B, OW-221B, OW-222B, OW-223B, MW-409B, and bedrock well P-213C.

The World Health Organization (2006) provided references noting background surface water and groundwater concentrations of cobalt ranged between 1 – 10 µg/L. Natural sources include erosion (wind-blown continental dusts, such as loess), weathering of rocks and soil, seawater spray, volcanoes, forest fires, extraction by plants, and continental and marine biogenic emissions. The major anthropogenic sources of environmental cobalt include mining and processing (smelting) of cobalt-bearing ores, the use of cobalt-containing sludge or phosphate fertilizers on soil, the disposal of cobalt containing waste, and atmospheric deposition from activities such as the burning of fossil fuels and smelting and refining of metals (Smith & Carson, 1981). The Black Hawk County Landfill area was farmed in the past; hence, the most likely source for cobalt is phosphate fertilizers. Another possible source may be due to deposition of wind-blown silts in the form of loess during the last glaciation which occurred in the Black Hawk County area. As such, cobalt levels at this location below 10 µg/L are considered to be naturally occurring, and no resampling is planned. Black Hawk County Landfill will continue to monitor cobalt concentrations in groundwater over time.

3.2 Quality Assurance/Quality Control Plan

To monitor the quality of sampling in the field and the quality of the laboratory processing and analysis, equipment blanks, trip blanks and field duplicate samples were collected during the April/May, July/August, October/November, and January (2025) sampling events at the Black Hawk County Landfill (Landfill). The April/May and October/November events were semi-annual sampling events, and the July/August and January (2025) event were re-sampling events to monitor for select parameters. A description of the quality control samples collected is provided below.

3.2.1 Trip Blanks

The primary purpose of a blank sample (“blank”) is to measure the magnitude of contaminant concentration (for analyte(s) of specific interest) that might have been introduced into the sample as a result of sampling-related and transport activities. A definition of trip blanks is as follows:

- A sample collected at the laboratory using analyte-free water in the appropriate sample container with the proper preservative, taken out to the field, and returned to the laboratory for analysis without being

opened. Trip blanks are generally for volatile organic compounds, low-level metals, and gasoline range hydrocarbon samples. The sample is used to assess contamination introduced during sample transport.

To assess the degree and type of accidental contamination by volatile organics during the sample collection and shipment procedures, one 40-ml volatile trip blank sample per cooler were filled completely with distilled water prior to mobilization to the site and stored with the sample volatile vials to be used during field sample collection.

3.2.2 Field Duplicates

The primary purpose of replicate samples is to identify and (or) quantify the variability in all or part of the sampling and analysis system. Replicates -- environmental samples collected in duplicate, triplicate, or greater multiples -- are considered identical or nearly identical in composition and are analyzed for the same chemical properties.

A definition of field duplicates is as follows:

- Two or more samples collected at the same sampling location. Field replicates should be samples collected side-by-side or by collecting one sample and immediately collecting the second sample. Field replicates represent the precision of the whole method, site heterogeneity, field sampling and the laboratory analysis.

Sequential replicates or field duplicates are samples of environmental water -- commonly groundwater -- that are collected consecutively (one after the other) from the same sampling site and that are subjected to identical laboratory analysis. The sequential replicate can be collected, for example, as a sample pumped from a well or stream. Sequential replicates are used to assess variability among samples that results from field activities (collection, processing, and shipping procedures). Because sequential replicates are not collected simultaneously, inhomogeneities in the water resource are incorporated into the variability measured. Also included is the variability inherent in laboratory handling and analysis of the samples.

3.2.3 Field Blanks

The primary purpose of field (rinsate or equipment) blank samples is to verify the effectiveness of the decontamination procedures on non-dedicated or reusable sampling equipment.

A definition of field blanks is as follows:

- A field (equipment or rinsate) blank is a volume of solution (in this case, laboratory-grade deionized water) used to rinse a sampling tool before sample collection. The rinse water is collected and tested to verify that the sampling tool is not contaminated.

For groundwater monitoring, 1 field blank is collected for every 20 samples, or 1 per sampling round, whichever is more frequent.

3.2.4 Field Duplicate, Field Blank, and Trip Blank Sample Results

Sample results for trip blanks, field blanks, and field duplicate samples were reviewed, and results of the analysis are summarized in Tables 9 and 10. A descriptive summary is provided below.

Trip Blanks

Trip blanks in 2024 had no detections above the RL.

Field Blanks

Field (equipment) blanks in 2024 had detections of inorganic parameter, barium, above the RL. Bromodichloromethane and trichloromethane were organic parameters detected above the RL.

Field Duplicates

Field duplicate results were compared to determine the precision between sampling results. The precision was based on a calculation of Relative Percent Difference (RPDs) between detected concentrations. RPDs within 20 percent limit for groundwater or within ±2x the reporting limit (RL) were considered acceptable. Field duplicates for detected results are summarized in Table 10.

Most of the duplicate results for all inorganics were all within 20 percent or ±2x the reporting limit (RL).

Conclusions

A review of detections in trip blanks and field blanks indicates sampling, decontamination, and sample storage/transport were generally conducted adequately. Results of field blank samples indicate there may have been some issues with inadequate decontamination; however, the field blank detections in 2024 were few, detected concentrations were generally estimated below the reporting limit, and several detected parameters were common laboratory contaminants. Decontamination procedures will continue to be reviewed to be sure all equipment is being adequately decontaminated between wells.

4. Recommendations

The Landfill is affecting local shallow groundwater quality at the west edge of unlined Area A and Area C and north side of Area C. An Assessment of Corrective Measures is underway for these areas, detailed results of the assessment were submitted to IDNR at the end of June 2018. An updated, standalone ACM report will be provided by January 31, 2025. The current assessment monitoring wells listed in Tables 7 and 8 will remain in assessment monitoring. Low-level releases also appear to be occurring to the groundwater underdrain dewatering layers of Area E and Cell X. Releases to the groundwater underdrain dewatering layers is being treated as leachate and is incorporated into the leachate discharge to the City of Waterloo wastewater treatment plant. Water quality at the deep monitoring wells located at the east edge of the landfill is not significantly impacted by Landfill activities.

Currently, monitoring wells OW-113B, OW-205B, OW-212B, OW-220B, OW-221B, OW-222B, OW-223B, OW-224B, OW-225B, OW-226B, OW-227B, OW-401B, OW-402B, and MW-409B have been sampled for Appendix II each year, for the past five years, with last full Appendix II sampling occurring in Fall 2024. All pass 1-of-2 Appendix II only detected parameters above RL have been added to the individual wells' semi-annual monitoring parameter list and are sampled at each semi-annual event. BHCL has modified the frequency of the complete list of Appendix II parameters from annual to once every five years for these wells. The HMSP has been revised to note this schedule. Analysis of sampling data will continue to be conducted in accordance with Chapter 113 of the IAC.

IDNR will be provided a copy of the RCRA Annual Report which provides results for all wells included in the RCRA permit.

2024 Annual Water Quality Report
Black Hawk County Landfill
Permit No. 7-SDP-1-75P

Monitoring Well	Monitored Landfill Unit	Formation	Groundwater System	Gradient	Current Monitoring Program (January 2024)	Change for Next Sampling Event	Constituents With SSI	Constituents With SSL	Total Number of Sampling Events in Each Monitoring Program		
									Detection	Assessment	Corrective Action
Groundwater Underdrains											
GUW1-1	Cell W1	Underdrain System	Water Table	Downgradient	Detection	Discharged to Leachate Collection System	Not Sampled due to access	Not Applicable	15	--	--
GUW2-1	Cell W2	Underdrain System	Water Table	Downgradient	Detection	Discharged to Leachate Collection System	Arsenic, Barium, Cobalt	Not Applicable	22	--	--
GUW3-1	Cell W3	Underdrain System	Water Table	Downgradient	Detection	Discharged to Leachate Collection System	Arsenic, Barium, Cobalt, Copper, Nickel, Thallium	Not Applicable	8	--	--
GUX-1/GUE-1	Cell X	Underdrain System	Water Table	Downgradient	Detection	Discharged to Leachate Collection System	Barium	Not Applicable	19	--	--
SW-1/GUE-2	Area E	Underdrain System	Water Table	Downgradient	Detection	Discharged to Leachate Collection System	Arsenic, Barium, Cobalt, Nickel, Benzene, Cis-1,2-Dichloroethylene	Not Applicable	20	--	--

Notes:
ACM = monitoring wells used for Assessment of Corrective Meassures
SSI = Statistically Significant Increase above background
Detection = Number (count) of sampling events since 2014 including resampling
Assessment = Number (count) of assessment sampling events since 2014
Corrective Action = Number (count) of corrective actions sampling events since 2014
SSL = Statistically Significant Level above groundwater protection standard
NC = No Change for next sampling event

Geological Unit Symbols:
Qal = Quaternary Alluvium
Ql = Quaternary Loess
QWT = Quaternary Pre-Illinoian Till Unit - Wolf Creek Formation
QAT = Quaternary Pre-Illinoian Till Unit - Alburnett Formation Unit A
Dcv= Devonian, Cedar Valley Formation Dolomite

Notes: Acronyms/Abbreviations:

RL = Reporting Limit
GWPS = Groundwater Protection Standard
PL = Prediction Limit
P = Parametric
NP = Non-Parametric
N = Normal
LN = Lognormal
NA = Not applicable
MCL = EPA Maximum Contaminant Level
SS = DNR Statewide Standard for a protected groundwater source
Background period for inorganics is fall 2014 through 2023.
Shaded Backround Level > IDNR GWPS

[1] = median RL based on nondetects

All underdrain groundwater (GUW1-1, GUE-2, GUW2-1, GUW3-1, and GUX-1) is combined with leachate, sent to wastewater treatment plant and treated.

Notes:

* Current result is above background, if confirmed by next sample an SSI will be identified
** Confirmed SSI
N = Assumed to be naturally occurring
NPL = Nonparametric prediction limit
NS = No standard; insufficient background data to estimate PL/NPL
PL = Parametric prediction limit
RL = Reporting limit
-- = not sampled
Gray Shading = groundwater concentration > GPS

5/23/2024 - 5/30/2024								
9/25/2024 - 10/25/2024	<9.70	<9.70						
10/25/2024 - 11/1/2024								

* - The displayed value is the arithmetic mean of multiple database matches.

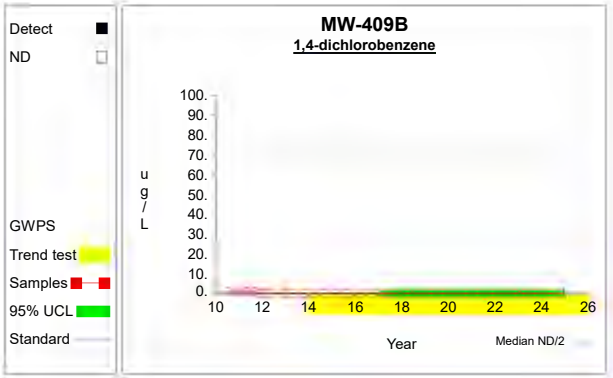

Table 9

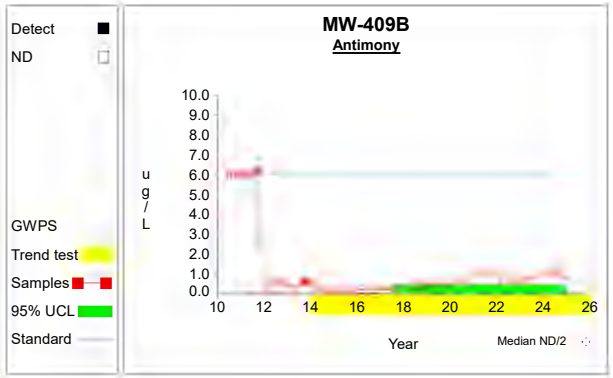
Analytical Data Summary for Zinc (ug/L)



Dates	OW-413B	OW-414B
2/24/2015 - 3/20/2015		
6/12/2015 - 6/26/2015		
8/20/2015 - 9/9/2015		
12/11/2015 - 12/17/2015		
3/7/2016 - 3/29/2016		
9/12/2016 - 10/11/2016		
12/6/2016 - 12/15/2016	<5.21	6.39
3/17/2017 - 4/8/2017	<11.50	<11.50
6/13/2017 - 6/21/2017	<11.50	<11.50
9/6/2017 - 9/29/2017	<11.50	<11.50
11/28/2017 - 11/30/2017	<11.50	<11.50
3/12/2018 - 4/11/2018	<10.00	<10.00
7/10/2018 - 7/17/2018		
8/29/2018 - 9/27/2018	<10.00 *	<10.00 *
12/16/2018		
3/26/2019 - 4/25/2019	<10.00	<10.00
9/17/2019 - 10/11/2019	<10.00	<10.00
3/23/2020 - 4/22/2020	<10.00	<10.00
8/18/2020 - 9/17/2020		
9/17/2020 - 10/8/2020	<10.00	<10.00
12/8/2020 - 12/10/2020		
3/11/2021 - 4/6/2021	<10.00	<10.00
6/17/2021 - 6/22/2021		
10/26/2021 - 11/24/2021	<10.00	
4/11/2022 - 5/11/2022	<10.00	<10.00
10/11/2022 - 11/10/2022	<10.00	
3/20/2023 - 4/19/2023	<6.40	<6.40
8/8/2023 - 9/7/2023		
9/7/2023 - 10/5/2023	<6.40	
4/23/2024 - 5/23/2024	<9.70	<9.70
5/23/2024 - 5/30/2024		
9/25/2024 - 10/25/2024	<9.70	
10/25/2024 - 11/1/2024		

* - The displayed value is the arithmetic mean of multiple database matches.

Zinc (ug/L) at MW-604B

Step	Equation	Description
1	$\overline{X}$ = **sum[X]** / **N** = **80.0** / **16** = **5.0**	Compute the mean of the last 16 measurements.
2	S = ((**sum[X^2]** - **sum[X]**^{2}/**N**) / (**N**-1))^{½} = ((**400.0** - **6400.0**/**16**) / (**16**-1))^{½} = **0.0**	Compute sd of the last 16 measurements.
3	LCL = $\overline{\mathbf{X}}$ - **tS**/**N**^{½} = **5.0** - **1.753** * **0.0**/**16**^{½} = **5.0**	Compute lower confidence limit for the mean of the last 16 measurements.
4	UCL = $\overline{\mathbf{X}}$ + **tS**/**N**^{½} = **5.0** + **1.753** * **0.0**/**16**^{½} = **5.0**	Compute upper confidence limit for the mean of the last 16 measurements.
5	N' = **N** * (**N**-1) / 2 = **23** * (**23**-1) / 2 = **253**	Number of sample pairs during trend detection period.
6	S = **0.0**	Sen's estimator of trend.
7	var(S) = **483.667**	Variance estimate for slope.
8	M(S) = (**N'** ± **Z**$_{.995}$ * **var(S)**^{½}) / 2 = (**253** ± **2.576** * **483.667**^{½}) / 2 = [**98.174**, **154.826**]	Ordinal positions for two-sided lower confidence limits for slope. The LCL and UCL are the Mth largest slope estimates for the values shown. When the values are not integers, interpolation is used.
9	CL(S) = [**0.0**, **0.0**]	Two-sided confidence interval for slope.
10	the interval includes 0	There is no significant trend.

Worksheet 6 - Assessment Monitoring
1,4-dichlorobenzene (ug/L) at MW-711B

Step	Equation	Description
1	$\overline{X}$ = **sum[X]** / **N** = **1.035** / **9** = **0.115**	Compute the mean of the last 9 measurements.
2	S = ((**sum[X^2]** - **sum[X]**^{2}/**N**) / (**N**-1))^{½} = ((**0.119** - **1.071**/**9**) / (**9**-1))^{½} = **0.0**	Compute sd of the last 9 measurements.
3	LCL = $\overline{\mathbf{X}}$ - **tS**/**N**^{½} = **0.115** - **1.86** * **0.0**/**9**^{½} = **0.115**	Compute lower confidence limit for the mean of the last 9 measurements.
4	UCL = $\overline{\mathbf{X}}$ + **tS**/**N**^{½} = **0.115** + **1.86** * **0.0**/**9**^{½} = **0.115**	Compute upper confidence limit for the mean of the last 9 measurements.
5	N' = **N** * (**N**-1) / 2 = **9** * (**9**-1) / 2 = **36**	Number of sample pairs during trend detection period.
6	S = **0.0**	Sen's estimator of trend.
7	var(S) = **0.0**	Variance estimate for slope.
8	M(S) = (**N'** ± **Z**$_{.995}$ * **var(S)**^{½}) / 2 = (**36** ± **2.576** * **0.0**^{½}) / 2 = [**18.0**, **18.0**]	Ordinal positions for two-sided lower confidence limits for slope. The LCL and UCL are the Mth largest slope estimates for the values shown. When the values are not integers, interpolation is used.
9	CL(S) = [**0.0**, **0.0**]	Two-sided confidence interval for slope.
10	the interval includes 0	There is no significant trend.

Worksheet 6 - Assessment Monitoring
Antimony (ug/L) at MW-711B

Step	Equation	Description
1	$\overline{X}$ = **sum[X]** / **N** = **4.5** / **9** = **0.5**	Compute the mean of the last 9 measurements.
2	S = ((**sum[X^2]** - **sum[X]**^{2}/**N**) / (**N**-1))^{½} = ((**2.25** - **20.25**/**9**) / (**9**-1))^{½} = **0.0**	Compute sd of the last 9 measurements.
3	LCL = $\overline{\mathbf{X}}$ - **tS**/**N**^{½} = **0.5** - **1.86** * **0.0**/**9**^{½} = **0.5**	Compute lower confidence limit for the mean of the last 9 measurements.
4	UCL = $\overline{\mathbf{X}}$ + **tS**/**N**^{½} = **0.5** + **1.86** * **0.0**/**9**^{½} = **0.5**	Compute upper confidence limit for the mean of the last 9 measurements.
5	N' = **N** * (**N**-1) / 2 = **9** * (**9**-1) / 2 = **36**	Number of sample pairs during trend detection period.
6	S = **0.0**	Sen's estimator of trend.
7	var(S) = **0.0**	Variance estimate for slope.
8	M(S) = (**N'** ± **Z**$_{.995}$ * **var(S)**^{½}) / 2 = (**36** ± **2.576** * **0.0**^{½}) / 2 = [**18.0**, **18.0**]	Ordinal positions for two-sided lower confidence limits for slope. The LCL and UCL are the Mth largest slope estimates for the values shown. When the values are not integers, interpolation is used.
9	CL(S) = [**0.0**, **0.0**]	Two-sided confidence interval for slope.
10	the interval includes 0	There is no significant trend.

Worksheet 6 - Assessment Monitoring
Arsenic (ug/L) at MW-711B

Step	Equation	Description
1	$\overline{X}$ = **sum[X]** / **N** = **3.375** / **9** = **0.375**	Compute the mean of the last 9 measurements.
2	S = ((**sum[X^2]** - **sum[X]**^{2}/**N**) / (**N**-1))^{½} = ((**1.266** - **11.391**/**9**) / (**9**-1))^{½} = **0.0**	Compute sd of the last 9 measurements.
3	LCL = $\overline{\mathbf{X}}$ - **tS**/**N**^{½} = **0.375** - **1.86** * **0.0**/**9**^{½} = **0.375**	Compute lower confidence limit for the mean of the last 9 measurements.
4	UCL = $\overline{\mathbf{X}}$ + **tS**/**N**^{½} = **0.375** + **1.86** * **0.0**/**9**^{½} = **0.375**	Compute upper confidence limit for the mean of the last 9 measurements.
5	N' = **N** * (**N**-1) / 2 = **9** * (**9**-1) / 2 = **36**	Number of sample pairs during trend detection period.
6	S = **0.0**	Sen's estimator of trend.
7	var(S) = **0.0**	Variance estimate for slope.
8	M(S) = (**N'** ± **Z**$_{.995}$ * **var(S)**^{½}) / 2 = (**36** ± **2.576** * **0.0**^{½}) / 2 = [**18.0**, **18.0**]	Ordinal positions for two-sided lower confidence limits for slope. The LCL and UCL are the Mth largest slope estimates for the values shown. When the values are not integers, interpolation is used.
9	CL(S) = [**0.0**, **0.0**]	Two-sided confidence interval for slope.
10	the interval includes 0	There is no significant trend.

Worksheet 6 - Assessment Monitoring
Barium (ug/L) at MW-711B

Step	Equation	Description
1	$\overline{X}$ = **sum[X]** / **N** = **580.2** / **9** = **64.467**	Compute the mean of the last 9 measurements.
2	S = ((**sum[X^2]** - **sum[X]**^{2}/**N**) / (**N**-1))^{½} = ((**44185.3** - **336632.04**/**9**) / (**9**-1))^{½} = **29.116**	Compute sd of the last 9 measurements.
3	LCL = $\overline{\mathbf{X}}$ - **tS**/**N**^{½} = **64.467** - **1.86** * **29.116**/**9**^{½} = **46.42**	Compute lower confidence limit for the mean of the last 9 measurements.
4	UCL = $\overline{\mathbf{X}}$ + **tS**/**N**^{½} = **64.467** + **1.86** * **29.116**/**9**^{½} = **82.514**	Compute upper confidence limit for the mean of the last 9 measurements.
5	N' = **N** * (**N**-1) / 2 = **9** * (**9**-1) / 2 = **36**	Number of sample pairs during trend detection period.
6	S = **-12.367**	Sen's estimator of trend.
7	var(S) = **92.0**	Variance estimate for slope.
8	M(S) = (**N'** ± **Z**$_{.995}$ * **var(S)**^{½}) / 2 = (**36** ± **2.576** * **92.0**^{½}) / 2 = [**5.646**, **30.354**]	Ordinal positions for two-sided lower confidence limits for slope. The LCL and UCL are the Mth largest slope estimates for the values shown. When the values are not integers, interpolation is used.
9	CL(S) = [**-59.753**, **-8.533**]	Two-sided confidence interval for slope.
10	UCL(S) < 0	**Significant decreasing trend.**

Worksheet 6 - Assessment Monitoring
Benzene (ug/L) at MW-711B

Step	Equation	Description
1	$\overline{X}$ = **sum[X]** / **N** = **0.99** / **9** = **0.11**	Compute the mean of the last 9 measurements.
2	S = ((**sum[X^2]** - **sum[X]**^{2}/**N**) / (**N**-1))^{½} = ((**0.109** - **0.98**/**9**) / (**9**-1))^{½} = **0.0**	Compute sd of the last 9 measurements.
3	LCL = $\overline{\mathbf{X}}$ - **tS**/**N**^{½} = **0.11** - **1.86** * **0.0**/**9**^{½} = **0.11**	Compute lower confidence limit for the mean of the last 9 measurements.
4	UCL = $\overline{\mathbf{X}}$ + **tS**/**N**^{½} = **0.11** + **1.86** * **0.0**/**9**^{½} = **0.11**	Compute upper confidence limit for the mean of the last 9 measurements.

2	S = ((**sum[X^2]** - **sum[X]**^{2}/**N**) / (**N**-1))^{½} = ((**0.513** - **7.701**/**15**) / (**15**-1))^{½} = **0.0**	Compute sd of the last 15 measurements.
3	LCL = $\overline{\mathbf{X}}$ - **tS**/**N**^{½} = **0.185** - **1.761** * **0.0**/**15**^{½} = **0.185**	Compute lower confidence limit for the mean of the last 15 measurements.
4	UCL = $\overline{\mathbf{X}}$ + **tS**/**N**^{½} = **0.185** + **1.761** * **0.0**/**15**^{½} = **0.185**	Compute upper confidence limit for the mean of the last 15 measurements.
5	N' = **N** * (**N**-1) / 2 = **15** * (**15**-1) / 2 = **105**	Number of sample pairs during trend detection period.
6	S = **0.0**	Sen's estimator of trend.
7	var(S) = **0.0**	Variance estimate for slope.
8	M(S) = (**N'** ± **Z**$_{.995}$ * **var(S)**^{½}) / 2 = (**105** ± **2.576** * **0.0**^{½}) / 2 = [**52.5**, **52.5**]	Ordinal positions for two-sided lower confidence limits for slope. The LCL and UCL are the Mth largest slope estimates for the values shown. When the values are not integers, interpolation is used.
9	CL(S) = [**0.0**, **0.0**]	Two-sided confidence interval for slope.
10	the interval includes 0	There is no significant trend.

Worksheet 6 - Assessment Monitoring
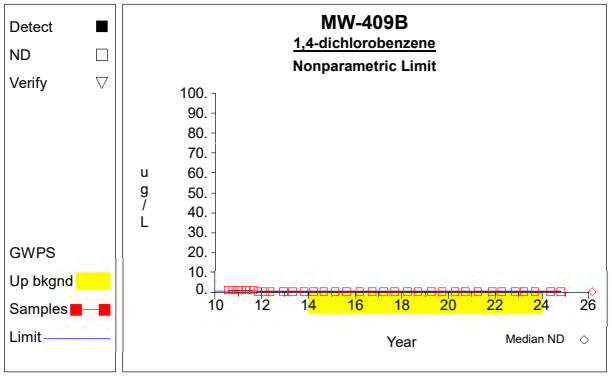
Thallium (ug/L) at OW-414B

Step	Equation	Description
1	$\overline{X}$ = **sum[X]** / **N** = **1.95** / **15** = **0.13**	Compute the mean of the last 15 measurements.
2	S = ((**sum[X^2]** - **sum[X]**^{2}/**N**) / (**N**-1))^{½} = ((**0.254** - **3.803**/**15**) / (**15**-1))^{½} = **3.66**x**10**$^{-9}$	Compute sd of the last 15 measurements.
3	LCL = $\overline{\mathbf{X}}$ - **tS**/**N**^{½} = **0.13** - **1.761** * **3.66**x**10**$^{-9}$/**15**^{½} = **0.13**	Compute lower confidence limit for the mean of the last 15 measurements.
4	UCL = $\overline{\mathbf{X}}$ + **tS**/**N**^{½} = **0.13** + **1.761** * **3.66**x**10**$^{-9}$/**15**^{½} = **0.13**	Compute upper confidence limit for the mean of the last 15 measurements.
5	N' = **N** * (**N**-1) / 2 = **15** * (**15**-1) / 2 = **105**	Number of sample pairs during trend detection period.
6	S = **0.0**	Sen's estimator of trend.
7	var(S) = **0.0**	Variance estimate for slope.
8	M(S) = (**N'** ± **Z**$_{.995}$ * **var(S)**^{½}) / 2 = (**105** ± **2.576** * **0.0**^{½}) / 2 = [**52.5**, **52.5**]	Ordinal positions for two-sided lower confidence limits for slope. The LCL and UCL are the Mth largest slope estimates for the values shown. When the values are not integers, interpolation is used.
9	CL(S) = [**0.0**, **0.0**]	Two-sided confidence interval for slope.
10	the interval includes 0	There is no significant trend.

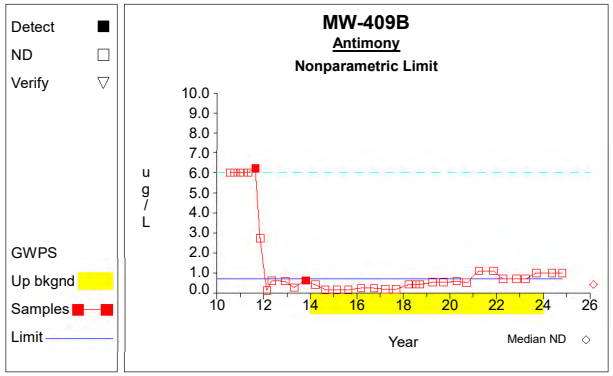
Worksheet 6 - Assessment Monitoring
Vanadium (ug/L) at OW-414B

Step	Equation	Description
1	$\overline{X}$ = **sum[X]** / **N** = **12.191** / **15** = **0.813**	Compute the mean of the last 15 measurements.
2	S = ((**sum[X^2]** - **sum[X]**^{2}/**N**) / (**N**-1))^{½} = ((**13.433** - **148.62**/**15**) / (**15**-1))^{½} = **0.502**	Compute sd of the last 15 measurements.
3	LCL = $\overline{\mathbf{X}}$ - **tS**/**N**^{½} = **0.813** - **1.761** * **0.502**/**15**^{½} = **0.585**	Compute lower confidence limit for the mean of the last 15 measurements.
4	UCL = $\overline{\mathbf{X}}$ + **tS**/**N**^{½} = **0.813** + **1.761** * **0.502**/**15**^{½} = **1.041**	Compute upper confidence limit for the mean of the last 15 measurements.
5	N' = **N** * (**N**-1) / 2 = **15** * (**15**-1) / 2 = **105**	Number of sample pairs during trend detection period.
6	S = **-0.158**	Sen's estimator of trend.
7	var(S) = **342.0**	Variance estimate for slope.
8	M(S) = (**N'** ± **Z**$_{.995}$ * **var(S)**^{½}) / 2 = (**105** ± **2.576** * **342.0**^{½}) / 2 = [**28.681**, **76.319**]	Ordinal positions for two-sided lower confidence limits for slope. The LCL and UCL are the Mth largest slope estimates for the values shown. When the values are not integers, interpolation is used.
9	CL(S) = [**-0.325**, **0.0**]	Two-sided confidence interval for slope.
10	the interval includes 0	There is no significant trend.



Worksheet 6 - Assessment Monitoring
Vinyl chloride (ug/L) at OW-414B

Step	Equation	Description
1	$\overline{X}$ = **sum[X]** / **N** = **44.12** / **15** = **2.941**	Compute the mean of the last 15 measurements.
2	S = ((**sum[X^2]** - **sum[X]**^{2}/**N**) / (**N**-1))^{½} = ((**190.161** - **1946.574**/**15**) / (**15**-1))^{½} = **2.077**	Compute sd of the last 15 measurements.
3	LCL = $\overline{\mathbf{X}}$ - **tS**/**N**^{½} = **2.941** - **1.761** * **2.077**/**15**^{½} = **1.997**	Compute lower confidence limit for the mean of the last 15 measurements.
4	UCL = $\overline{\mathbf{X}}$ + **tS**/**N**^{½} = **2.941** + **1.761** * **2.077**/**15**^{½} = **3.886**	Compute upper confidence limit for the mean of the last 15 measurements.
5	N' = **N** * (**N**-1) / 2 = **15** * (**15**-1) / 2 = **105**	Number of sample pairs during trend detection period.
6	S = **-0.75**	Sen's estimator of trend.
7	var(S) = **407.333**	Variance estimate for slope.
8	M(S) = (**N'** ± **Z**$_{.995}$ * **var(S)**^{½}) / 2 = (**105** ± **2.576** * **407.333**^{½}) / 2 = [**26.505**, **78.495**]	Ordinal positions for two-sided lower confidence limits for slope. The LCL and UCL are the Mth largest slope estimates for the values shown. When the values are not integers, interpolation is used.
9	CL(S) = [**-1.167**, **-0.042**]	Two-sided confidence interval for slope.
10	UCL(S) < 0	**Significant decreasing trend.**



Worksheet 6 - Assessment Monitoring
Zinc (ug/L) at OW-414B

Step	Equation	Description
1	$\bar{X}$ = **sum[X]** / **N** = **76.39** / **15** = **5.093**	Compute the mean of the last 15 measurements.
2	S = ((**sum[X^2]** - **sum[X]**^{2}/**N**) / (**N**-1))^{½} = ((**390.832** - **5835.432**/**15**) / (**15**-1))^{½} = **0.359**	Compute sd of the last 15 measurements.
3	LCL = $\bar{\mathbf{X}}$ - **tS**/**N**^{½} = **5.093** - **1.761** * **0.359**/**15**^{½} = **4.929**	Compute lower confidence limit for the mean of the last 15 measurements.
4	UCL = $\bar{\mathbf{X}}$ + **tS**/**N**^{½} = **5.093** + **1.761** * **0.359**/**15**^{½} = **5.256**	Compute upper confidence limit for the mean of the last 15 measurements.
5	N' = **N** * (**N**-1) / 2 = **15** * (**15**-1) / 2 = **105**	Number of sample pairs during trend detection period.
6	S = **0.0**	Sen's estimator of trend.
7	var(S) = **74.667**	Variance estimate for slope.
8	M(S) = (**N'** ± **Z**$_{.995}$ * **var(S)**^{½}) / 2 = (**105** ± **2.576** * **74.667**^{½}) / 2 = [**41.37**, **63.63**]	Ordinal positions for two-sided lower confidence limits for slope. The LCL and UCL are the Mth largest slope estimates for the values shown. When the values are not integers, interpolation is used.
9	CL(S) = [**0.0**, **0.0**]	Two-sided confidence interval for slope.
10	the interval includes 0	There is no significant trend.

Zinc	10	180	0.056	0.041	1.280					2.326	normal

* - Distribution override for that constituent.
Fit to distribution is confirmed if G <= critical value.
Model type may not match distributional form when detection frequency < 50%.

Conf = confidence level for passing initial test or one of two verification resamples at all downgradient wells for a single constituent (nonparametric test only).
* - Insufficient Data.
** - Calculated limit raised to Manual Reporting Limit.
*** - Nonparametric limit based on ND value.
For transformed data, mean and SD in transformed units and prediction limit in original units.
All sample sizes and statistics are based on outlier free data.
For nonparametric limits, median reporting limits are substituted for extreme reporting limit values.

N = Total number of independent measurements in background at each well.
Date Range = Dates of the first and last measurements included in background at each well.
Critical Value depends on the significance level and on N-1 when the two most extreme values are tested or N for the most extreme value.

Table 6

Dixon's Test Outliers
1% Significance Level

* - Significantly increased over background.
** - Detect at limit for 100% NDs in background (NPPL only).
*** - Manual exclusion.
ND = Not Detected, Result = detection limit.

Worksheet 1 - Upgradient vs. Downgradient Comparisons
1,4-dichlorobenzene (ug/L)
Nonparametric Prediction Limit

Step	Equation	Description
1	PL = max(X) = **0.427**	Compute nonparametric prediction limit as largest background measurement.
2	Conf = **0.99**	Confidence level is based on N, K and resampling strategy (see Gibbons 1994).

Worksheet 1 - Upgradient vs. Downgradient Comparisons
Antimony (ug/L)
Nonparametric Prediction Limit

Step	Equation	Description
1	PL = max(X) = **0.69**	Compute nonparametric prediction limit as largest background measurement.
2	Conf = **0.99**	Confidence level is based on N, K and resampling strategy (see Gibbons 1994).

Worksheet 1 - Upgradient vs. Downgradient Comparisons
Arsenic (ug/L)
Nonparametric Prediction Limit

Step	Equation	Description
1	PL = max(X) = **4.18**	Compute nonparametric prediction limit as largest background measurement.
2	Conf = **0.99**	Confidence level is based on N, K and resampling strategy (see Gibbons 1994).

Worksheet 1 - Upgradient vs. Downgradient Comparisons
Barium (ug/L)
Nonparametric Prediction Limit

Step	Equation	Description
1	PL = max(X) = **484.0**	Compute nonparametric prediction limit as largest background measurement.
2	Conf = **0.99**	Confidence level is based on N, K and resampling strategy (see Gibbons 1994).

Worksheet 1 - Upgradient vs. Downgradient Comparisons
Benzene (ug/L)
Nonparametric Prediction Limit

Step	Equation	Description
1	PL = max(X) = **0.229**	Compute nonparametric prediction limit as largest background measurement.
2	Conf = **0.99**	Confidence level is based on N, K and resampling strategy (see Gibbons 1994).

Worksheet 1 - Upgradient vs. Downgradient Comparisons
Beryllium (ug/L)
Nonparametric Prediction Limit

Step	Equation	Description
1	PL = max(X) = **0.27**	Compute nonparametric prediction limit as largest background measurement.
2	Conf = **0.99**	Confidence level is based on N, K and resampling strategy (see Gibbons 1994).

Worksheet 1 - Upgradient vs. Downgradient Comparisons
Beta-bhc (ug/L)
Nonparametric Prediction Limit

Step	Equation	Description
1	PL = max(X) = **0.018**	Compute nonparametric prediction limit as largest background measurement.
2	Conf = **0.966**	Confidence level is based on N, K and resampling strategy (see Gibbons 1994).

Worksheet 1 - Upgradient vs. Downgradient Comparisons
Cadmium (ug/L)
Nonparametric Prediction Limit

Step	Equation	Description
1	PL = max(X) = **12.2**	Compute nonparametric prediction limit as largest background measurement.
2	Conf = **0.99**	Confidence level is based on N, K and resampling strategy (see Gibbons 1994).

Worksheet 1 - Upgradient vs. Downgradient Comparisons
Chromium (ug/L)
Nonparametric Prediction Limit

Step	Equation	Description
1	PL = max(X) = **27.0**	Compute nonparametric prediction limit as largest background measurement.
2	Conf = **0.99**	Confidence level is based on N, K and resampling strategy (see Gibbons 1994).

Worksheet 1 - Upgradient vs. Downgradient Comparisons
Cis-1,2-dichloroethylene (ug/L)
Nonparametric Prediction Limit

Step	Equation	Description
1	PL = max(X) = **0.296**	Compute nonparametric prediction limit as largest background measurement.
2	Conf = **0.99**	Confidence level is based on N, K and resampling strategy (see Gibbons 1994).

Worksheet 1 - Upgradient vs. Downgradient Comparisons
Cobalt (ug/L)
Lognormal Prediction Limit

Step	Equation	Description
1	$Y = \log_e(X)$	Transform to natural logarithmic scale.
2	$\overline{Y}_1 = \mathbf{sum[Y_1]} / \mathbf{N_1}$ $= \mathbf{-22.671} / \mathbf{98}$ $= \mathbf{-0.231}$	Compute mean of N_1 detected log transformed measurements.
3	$S_{Y_1} = ((\mathbf{sum[Y_1^2]} - \mathbf{sum[Y_1]}^2/\mathbf{N_1}) / (\mathbf{N_1}-1))^{½}$ $= ((\mathbf{215.027} - \mathbf{513.989}/\mathbf{98}) / (\mathbf{98}-1))^{½}$ $= \mathbf{1.471}$	Compute sd of N_1 detected log transformed measurements.
4	$\overline{Y} = (1 - \mathbf{N_0}/\mathbf{N})\ \overline{\mathbf{Y}}_1$ $= (1 - \mathbf{80}/\mathbf{178})\ (\mathbf{-0.231})$ $= \mathbf{-0.127}$	Use Aitchison's method to adjust mean for presence of nondetects (log scale).
5	$S_Y = [(1 - \mathbf{N_0}/\mathbf{N}) * \mathbf{S_{Y_1}}^2 +$ $(\mathbf{N_0}/\mathbf{N}) (1 - (\mathbf{N_0}-1)/(\mathbf{N}-1)) \overline{\mathbf{Y}}_1^{\,2}]^{½}$ $= [(1 - \mathbf{80}/\mathbf{178}) * \mathbf{1.471}^2 +$ $(\mathbf{80}/\mathbf{178}) (1 - (\mathbf{80}-1)/(\mathbf{178}-1)) (\mathbf{-0.231})^2]^{½}$ $= \mathbf{1.097}$	Use Aitchison's method to adjust sd for presence of nondetects (log scale).
6	$alpha = (1-.95^{1/\mathbf{K}})^{1/3}$ $= (1-.95^{1/\mathbf{588}})^{1/3}$ $= \mathbf{0.0443}$	Adjusted per comparison false positive rate. Pass initial or 1 of 2 resamples.
7	$PL = \exp[\overline{\mathbf{Y}} + \mathbf{tS_Y}(1+1/\mathbf{N})^{½}]$ $= \exp[\mathbf{-0.127}$ $+ (\mathbf{1.712}*\mathbf{1.097})(1+1/\mathbf{178})^{½}]$ $= \mathbf{5.79}$	One-sided lognormal prediction limit (t is Student's t on N-1 degrees of freedom and 1-alpha confidence level).

Worksheet 1 - Upgradient vs. Downgradient Comparisons
Copper (ug/L)
Nonparametric Prediction Limit

Step	Equation	Description
1	$PL = \max(X)$ $= \mathbf{11.5}$	Compute nonparametric prediction limit as largest background measurement.
2	Conf = **0.99**	Confidence level is based on N, K and resampling strategy (see Gibbons 1994).

Worksheet 1 - Upgradient vs. Downgradient Comparisons
Lead (ug/L)
Nonparametric Prediction Limit

Step	Equation	Description
1	PL = max(X) = **1.48**	Compute nonparametric prediction limit as largest background measurement.
2	Conf = **0.99**	Confidence level is based on N, K and resampling strategy (see Gibbons 1994).

Worksheet 1 - Upgradient vs. Downgradient Comparisons
Nickel (ug/L)
Lognormal Prediction Limit

Step	Equation	Description
1	$Y = \log_e(X)$	Transform to natural logarithmic scale.
2	$\bar{Y}_1 = \mathbf{sum[Y_1]} / \mathbf{N_1}$ = **242.957** / **105** = **2.314**	Compute mean of N_1 detected log transformed measurements.
3	$S_{Y_1} = ((\mathbf{sum[Y_1^2]} - \mathbf{sum[Y_1]}^2/\mathbf{N_1}) / (\mathbf{N_1}-1))^{½}$ = ((**771.39**-**59027.933**/**105**) / (**105**-1))^{½} = **1.418**	Compute sd of N_1 detected log transformed measurements.
4	$\bar{Y} = (1 - \mathbf{N_0}/\mathbf{N})\ \bar{Y}_1$ = (1 - **78**/**183**) **2.314** = **1.328**	Use Aitchison's method to adjust mean for presence of nondetects (log scale).
5	$S_Y = [(1 - \mathbf{N_0}/\mathbf{N}) * S_{Y_1}^2 + (\mathbf{N_0}/\mathbf{N}) (1 - (\mathbf{N_0}-1)/(\mathbf{N}-1)) \bar{Y}_1^2]^{½}$ = [(1 - **78**/**183**) * **1.418**^{2} + (**78**/**183**) (1 - (**78**-1)/(**183**-1)) **2.314**^{2}]^{½} = **1.572**	Use Aitchison's method to adjust sd for presence of nondetects (log scale).
6	alpha = (1-.95$^{1/\mathbf{K}}$)$^{1/3}$ = (1-.95$^{1/\mathbf{588}}$)$^{1/3}$ = **0.0443**	Adjusted per comparison false positive rate. Pass initial or 1 of 2 resamples.
7	$PL = \exp[\bar{Y} + \mathbf{t}S_Y(1+1/\mathbf{N})^{½}]$ = exp[**1.328** + (**1.711***1.572)(1+1/**183**)^{½}] = **55.992**	One-sided lognormal prediction limit (t is Student's t on N-1 degrees of freedom and 1-alpha confidence level).

Worksheet 1 - Upgradient vs. Downgradient Comparisons
Selenium (ug/L)
Nonparametric Prediction Limit

Step	Equation	Description
1	PL = max(X) = **2.23**	Compute nonparametric prediction limit as largest background measurement.
2	Conf = **0.99**	Confidence level is based on N, K and resampling strategy (see Gibbons 1994).

Worksheet 1 - Upgradient vs. Downgradient Comparisons
Silver (ug/L)
Nonparametric Prediction Limit

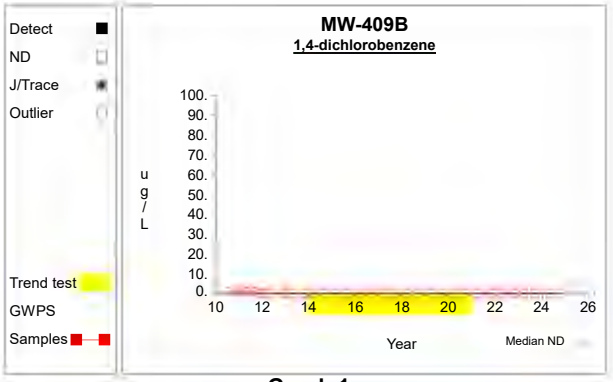
Step	Equation	Description
1	PL = max(X) = **0.37**	Compute nonparametric prediction limit as largest background measurement.
2	Conf = **0.99**	Confidence level is based on N, K and resampling strategy (see Gibbons 1994).

Worksheet 1 - Upgradient vs. Downgradient Comparisons
Thallium (ug/L)
Nonparametric Prediction Limit

Step	Equation	Description
1	PL = max(X) = **0.26**	Compute nonparametric prediction limit as largest background measurement.
2	Conf = **0.99**	Confidence level is based on N, K and resampling strategy (see Gibbons 1994).

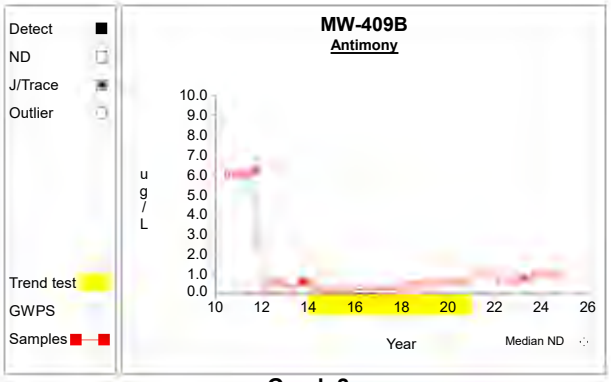
Worksheet 1 - Upgradient vs. Downgradient Comparisons
Vanadium (ug/L)
Nonparametric Prediction Limit

Step	Equation	Description
1	PL = max(X) = **2.59**	Compute nonparametric prediction limit as largest background measurement.
2	Conf = **0.99**	Confidence level is based on N, K and resampling strategy (see Gibbons 1994).



Worksheet 1 - Upgradient vs. Downgradient Comparisons
Vinyl chloride (ug/L)
Nonparametric Prediction Limit

Step	Equation	Description
1	PL = median(X) = **0.18**	Compute nonparametric prediction limit as median reporting limit in background.
2	Conf = **0.99**	Confidence level is based on N, K and resampling strategy (see Gibbons 1994).



Worksheet 1 - Upgradient vs. Downgradient Comparisons
Zinc (ug/L)
Nonparametric Prediction Limit

Step	Equation	Description
1	PL = max(X) = **28.4**	Compute nonparametric prediction limit as largest background measurement.
2	Conf = **0.99**	Confidence level is based on N, K and resampling strategy (see Gibbons 1994).

Vanadium	12	41	0.293	10	153	0.065
Zinc	1	38	0.026	49	153	0.320

N = Total number of measurements in all wells.
Detect = Total number of detections in all wells.
Proportion = Detect/N.

Table 4

Shapiro-Wilk Multiple Group Test of Normality

Constituent	Detect	N	Detect Freq	G raw	G log	G cbrt	G sqrt	G sqr	G cub	Crit Value	Dist Form	Model Type
Antimony	12	42	0.286	1.433	0.772					2.326	normal	nonpar
Arsenic	9	41	0.220	0.685	0.631					2.326	normal	nonpar

Thallium	2	42	0.048									nonpar
Vanadium	12	41	0.293	0.179	0.098					2.326	normal	nonpar
Zinc	1	38	0.026									nonpar

* - Distribution override for that constituent.
Fit to distribution is confirmed if G <= critical value.
Model type may not match distributional form when detection frequency < 50%.

Table 5

Summary Statistics and Prediction Limits

Constituent	Units	Detect	N	Mean	SD	alpha	Factor	Pred Limit	Type		Conf
Antimony	ug/L	12	42					1.8100	nonpar		0.99

Vanadium	ug/L	12	41					1.1700	nonpar		0.99
Zinc	ug/L	1	38					10.0000	nonpar	***	0.99

Conf = confidence level for passing initial test or one of two verification resamples at all downgradient wells for a single constituent (nonparametric test only).
* - Insufficient Data.
** - Calculated limit raised to Manual Reporting Limit.
*** - Nonparametric limit based on ND value.
For transformed data, mean and SD in transformed units and prediction limit in original units.
All sample sizes and statistics are based on outlier free data.
For nonparametric limits, median reporting limits are substituted for extreme reporting limit values.

Table 6

Dixon's Test Outliers
1% Significance Level

Constituent	Units	Well	Date	Result	ND Qualifier	Date Range	N	Critical Value
