Executive Summary

This Annual Water Quality Report (AWQR) was prepared by GHD on behalf of MidAmerican Energy Company (MidAmerican) for the Neal North Energy Center (Neal North) Closed Coal Combustion Residual (CCR) Monofill (Closed Monofill) located near Sergeant Bluff, Iowa. MidAmerican previously requested a variance from Paragraphs 567-103.1(2)f, 567—103.1(4)d, and 567—103.1(4)e of the Iowa Administrative Code (IAC) which was granted in Permit Amendments No. 4 and No. 5, dated November 30, 2016 and March 6, 2017, respectively.

The variance requests were made to match the groundwater monitoring and reporting requirements established under the Federal CCR rule (40 CFR Part 257). Although the Closed Monofill is not subject to the Federal CCR rules, GHD prepared this AWQR for the closed Neal North Monofill to generally reflect the Federal CCR rule monitoring and reporting requirements for consistency in the monitoring and reporting requirements used for the active Neal North Monofill and the requirements of the Hydrologic Monitoring System Plan prepared for the Closed Monofill. The closed portion of the Neal North Monofill was originally permitted under Operating Permit 97-SDP-12-95P; the closed portion of the Monofill has since been assigned Closure Permit 97-SDP-24-20C and the active Monofill cells retained the original operating permit number. The purpose of this AWQR is to summarize results of the assessment groundwater quality monitoring events completed in March 2024 and September 2024 at the Closed Monofill.

The groundwater monitoring network consists of 38 monitoring wells. Groundwater elevation data were collected from the 38 wells, and groundwater samples were collected from 10 of the 38 monitoring wells. The 10 sampled monitoring wells are screened at the water table. Sampling was conducted using dedicated bladder pumps to purge water and collect samples using low-flow sampling techniques. Groundwater samples were analyzed for the parameters specified in 40 CFR Part 257 Appendix III and Appendix IV analytes for the assessment monitoring events.

The predominant site-wide flow direction is southwest, toward the Missouri River. The Closed Monofill completed baseline monitoring events in June 2022 and conducted detection monitoring in September 2022 and March 2023. September 2023 was the first assessment monitoring event at the Closed Monofill, and the site has remained in assessment monitoring through the 2024 reporting period. No changes to the monitoring network or sampling procedures are necessary to evaluate groundwater quality upgradient and downgradient of the Closed Monofill.

UTL = Upper tolerance limit

V = Average horizontal linear velocity

1. Introduction

This Annual Water Quality Report (AWQR) was prepared by GHD on behalf of MidAmerican Energy Company (MidAmerican) for the Neal North Energy Center (Neal North) Closed Coal Combustion Residual (CCR) Monofill (Closed Monofill) located near Sergeant Bluff, Iowa. MidAmerican previously requested a variance from Paragraphs 567—103.1(2)f, 567—103.1(4)d, and 567—103.1(4)e of the Iowa Administrative Code (IAC) which was granted in Permit Amendments No. 4 and No. 5, dated November 30, 2016 and March 6, 2017, respectively. The variance requests were made to match the groundwater monitoring and reporting requirements established under the Federal CCR rule (40 CFR Part 257). Although the Closed Monofill is not subject to the Federal CCR rule, GHD prepared this AWQR for the closed Neal North Monofill to generally reflect the Federal CCR rule monitoring and reporting requirements for consistency in the monitoring and reporting requirements used for the active Neal North Monofill and the requirements of the Hydrologic Monitoring System Plan (HMSP; GHD, 2020) prepared for the Closed Monofill. The closed portion of the Neal North Monofill was originally permitted under Operating Permit 97 SDP-12-95P; the closed portion of the Monofill has since been assigned Closure Permit 97-SDP-24-20C and the active Monofill cells retained the original permit number. The purpose of this AWQR is to summarize results of the groundwater quality assessment monitoring events completed in March and September 2024, as well as one verification monitoring event in June 2024 at the Closed Monofill.

The Closed Monofill is located primarily in the NW ¼ of the SW ¼ of Section 30 Township 87N, Range 47W (East Cell) and the E ½ of the SE ¼ of Section 25 Township 87N Range 48W (West Cell). Portions extend to the S ¼ of the SW ¼ of the NW ¼ of Section 30 Township 87N Range 47W (East Cell) and to the SE ¼ of the SE ¼ of the NE ½ of Section 25 Township 87N Range 48W (West Cell). The Site Location Map (Figure 1.1) also shows the location of MidAmerican's Neal South Energy Center facility. The Closed Monofill extent and monitoring well locations are shown on Figure 1.2.

Groundwater monitoring has routinely been conducted at the Monofill since 1996 when a network of 20 monitoring wells was installed. Additional monitoring wells were installed around the now-active Monofill areas in 2006, 2009, and 2015 (with subsequent replacement of some wells due to drought conditions), creating the monitoring well network now in place at the Neal North Monofill. Prior to the Federal CCR rule, groundwater monitoring was conducted annually, and findings were documented in AWQRs submitted to the Iowa Department of Natural Resources (IDNR).

The uppermost aquifer at the Closed Monofill is the water table aquifer. Perched groundwater has been encountered at multiple locations and is included in the groundwater monitoring plan. In general, the subsurface geology at the Closed Monofill includes a layer of fine-grained materials (silts and clays) overlying predominately fine sand with some sand and gravel at depth. A layer of clay up to 55 feet thick has been found at the location of monitoring wells MW-17/MW-18, MW-19/MW-20, MW-21/MW-22, and MW-31/MW-32. Although bedrock was not encountered during hydrogeological investigations, bedrock was encountered at 137 feet below ground surface (BGS) near the Neal North generating unit during the installation of a water well.

2. Sampling Protocol

2.1 Groundwater Monitoring Network

The groundwater monitoring network consists of 38 monitoring wells (Table 1). Groundwater elevation data were collected from the 38 wells, plus monitoring wells associated with additional monitoring networks at the Neal North Energy Center. Groundwater samples were collected from 10 of the 38 monitoring wells (Table 2). The 10 sampled monitoring wells are screened at the water table (approximately 17-29 feet BGS) in the alluvial aquifer. Horizontal spacing between the downgradient alluvial aquifer monitoring wells ranges from approximately 300 to 400 feet. The

groundwater monitoring network includes monitoring wells used for collection of groundwater samples and for gauging groundwater elevations. Groundwater samples are used to assess potential impacts of the Closed Monofill on surrounding groundwater. Groundwater elevation data are used to identify upgradient and downgradient monitoring points and to determine the potential influence of the Missouri River on groundwater conditions.

All monitoring wells in the groundwater monitoring system consist of 2-inch nominal inner-diameter polyvinyl chloride (PVC) casing and screen. Monitoring well construction included placement of clean silica sand in the screened interval and an annular seal of bentonite to the near surface. Monitoring well surface completions consist of either a lockable stick-up surface casing set in a concrete pad and placement of protective bollards in locations where traffic may be of concern, or a flushmount cover with a watertight well plug in high traffic areas where a stick-up well is not suitable. Review of monitoring records and well inspections indicate the monitoring wells have been operated and maintained adequately to meet the design specifications of the monitoring program.

2.2 Monitoring Well Inspection

During each sampling event, the monitoring wells were visually inspected, and any deficient conditions of the monitoring wells were noted. The monitoring wells are subject to regular maintenance and performance evaluations as shown in Table 3. Wells are maintained with a well cap and a lockable protective casing. Observations include the condition of the protective casing/vault and surrounding ground surface. All wells were found to be in generally good condition, with no issues affecting well or sample integrity. Due to the surrounding topography, sediment has accumulated on top of some of the monitoring well pads. The sediment will be removed to inspect well pads during the next monitoring event.

On an annual basis, the total well depth of each well in the monitoring network is measured to evaluate the well condition and potential sediment accumulation in the well. Total well depth measurements from the 2024 total depth measurements are presented in Table 4. If screen occlusion greater than 10 percent is determined to be present, the well will be redeveloped prior to the next sampling event. All sampled well screens were at or below the 10 percent criterion.

2.3 Sample Collection

Sampling was conducted using dedicated bladder pumps to purge water and collect samples using low-flow sampling techniques.

Prior to sample collection, the temperature, conductivity, pH, oxidation-reduction potential (ORP), dissolved oxygen, and turbidity of the purge water were measured using a calibrated multiparameter water quality instrument and flow cell. The readings were recorded using the multiparameter meter data logger, on well sampling records, or in a field notebook. Upon stabilization, unfiltered samples were collected in laboratory-supplied containers. Copies of the groundwater sampling records for the 2024 monitoring events are included in Appendix A. During the 2024 monitoring events, field duplicate samples were collected from monitoring wells MW-1R (March and September 2024), MW-27 (September 2024), and MW-223S (March 2024) for quality assurance/quality control (QA/QC) purposes. In June 2024, a duplicate was collected from a monitoring well associated with the additional monitoring networks at Neal North.

2.4 Analytical Parameters

Groundwater samples were analyzed for the parameters specified in 40 CFR Part 257 Appendix III and Appendix IV analytes (Table 5) for the assessment monitoring events. The verification sampling event in June 2024 was analyzed for a subset of the Appendix III and IV analytes. The majority of the laboratory analyses were conducted by Eurofins Environment Testing North Central, LLC (Eurofins) in Cedar Falls, Iowa; the radium 226/228 analyses were conducted by Eurofins in St. Louis, Missouri. Analyses were conducted by the laboratory in accordance with the procedures and methods described in the United States Environmental Protection Agency (USEPA) Manual SW-846, "Test Methods for Evaluating Solid Waste, Physical/Chemical Methods (September 1986)," as updated and/or in accordance with other approved testing procedures. Eurofins provided prepared sample containers for each monitoring event.

Analytical reports from each sampling event report total (i.e., unfiltered) sample results in accordance with the Federal CCR rule.

Table 2 summarizes the sample history for each monitoring well and the analyte list used for each event.

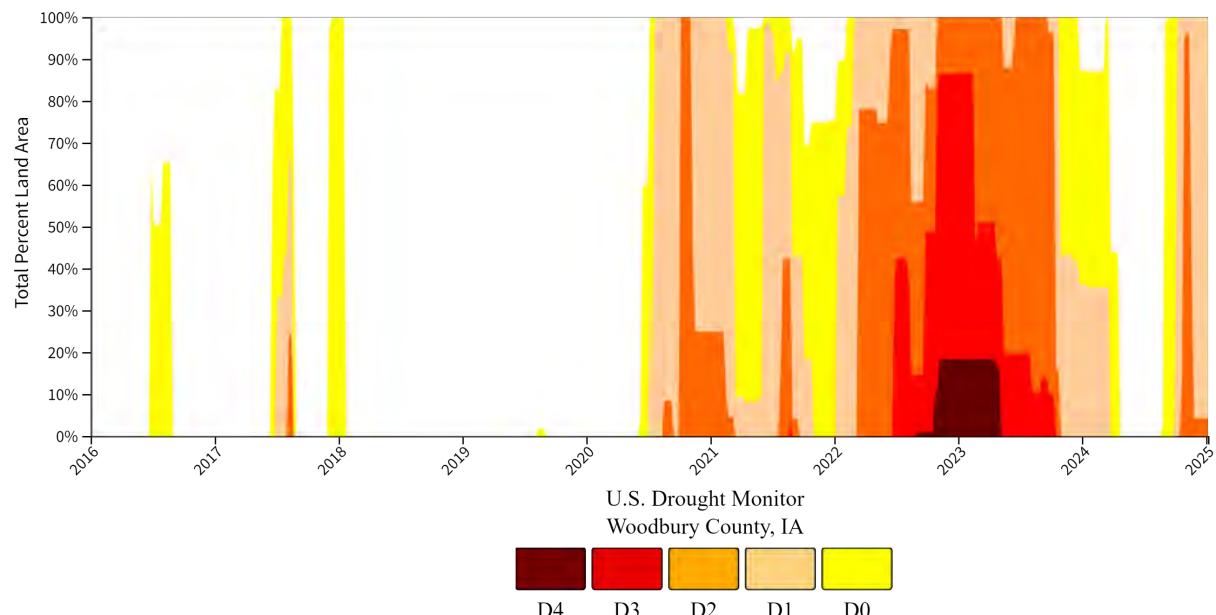

Following receipt of the final laboratory analytical reports from each round of sampling, GHD completed an analytical data quality assessment and validation for the groundwater and field quality assurance samples collected during the baseline monitoring events. Based on these assessments, the data are acceptable for use as reported by the laboratories.

3. Groundwater Flow Conditions

3.1 Drought and Flood Conditions

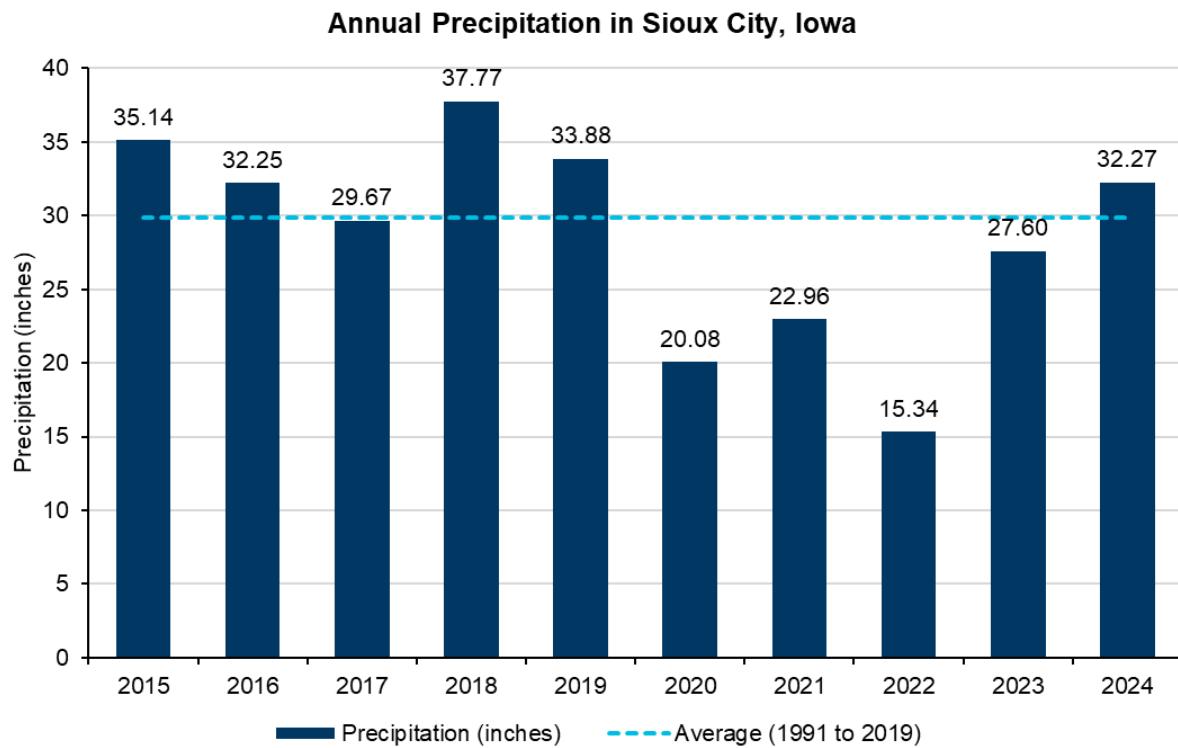

Groundwater levels at Neal North declined over the last few years due to regional drought conditions. Drought conditions for Woodbury County from 2016 through December 31, 2024 reported by the U.S. Drought Monitor are shown on Inset 1. In mid-2020, 100 percent of the area of Woodbury County was recorded as D0 Abnormally Dry, which then intensified into D1 Moderate Drought and then D2 Severe Drought for a period of time. In early 2021, approximately 80 percent of Woodbury County was in drought. Since early 2022, the entire county has been at least D1 Moderate Drought, with significant periods of time where all or most of the county is in D2 Severe Drought or D3 Extreme Drought. During late 2022 and early 2023, almost 20 percent of the county, including Neal North, was reported as D4 Exceptional Drought. Beginning mid-April 2024, all of Woodbury County was no longer under drought conditions until September 2024. Since October 2024, all of Woodbury County has been reported as D1 Moderate Drought to D2 Severe Drought.

On June 21, 2024, Woodbury County underwent a county-wide flood event. Prior to this, pressure transducers were installed at six locations at the site: MW-217S, MW-218S, MW-219S, MW-227S, MW-230S, and MW-235S. As a response to the anticipated flooding, GHD deployed additional pressure transducers on June 20, 2024 at monitoring wells MW-233S and MW-234S. These transducers will assist in monitoring groundwater elevation changes as a result of the June 2024 flooding event, as well as groundwater elevation changes between sampling events.

Inset 1. Drought conditions for Woodbury County. <https://www.drought.gov/states/iowa/county/Woodbury>

The annual precipitation for the Sioux City area is shown on Inset 2. The average annual rainfall (1991 through 2019) at Sioux City, Iowa is 29.90 inches. Annual rainfall was near normal or above average from 2015 through 2019. From 2020 through 2023, rainfall was below the annual average. The annual rainfall total was above average in 2024 for the first time since 2019. From mid-October 2023 through December 2024, the accumulated precipitation was consistently above average. The annual precipitation total for 2024 is 32.27 inches, which is approximately 3 inches above average.

Inset 2. Annual precipitation in Sioux City, Iowa, 2015 through 2024. <https://hprcc.unl.edu/stationtool/explore.php?sid=USW00014943%27>

During 2018 and 2019, releases from the Missouri River reservoir system upstream to the site were higher-than average. During 2020 through 2023, releases into the Missouri River from the reservoir system decreased river stage near the site (Inset 3) and reduced precipitation occurred (Inset 2). In mid-2024, the river stage began to increase. The flood event that occurred mid-June 2024 is recorded on Inset 3. The river stage increased to levels higher than that which was recorded in 2019. After June 2024, the river stage returned back to similar levels as those observed in 2023.

Missouri River at Sioux City, IA - 06486000

Gage height, feet

Inset 3. Missouri River elevations at Sioux City, Iowa. <https://waterdata.usgs.gov/monitoring-location/06486000/#parameterCode=00065&period=P2742D>

Groundwater elevations since monitoring began in late 2015 are shown on Inset 4 for select monitoring wells at Neal North. The highest observed groundwater elevations occurred in 2019 and were on a generally decreasing trend through 2023, corresponding with below average precipitation in the area and reduced flows in the Missouri River. Corresponding with an increase in precipitation in the area, groundwater elevations have increased during recent gauging events.

Inset 4. Hydrograph for select wells at Neal North.

3.2 Horizontal Groundwater Flow

Groundwater levels were measured at each of the monitoring wells included in the monitoring network during each semiannual monitoring event. Many of the Closed Monofill groundwater monitoring wells are in a nested pair with one shallow and one deep well, as illustrated on Figure 1.2. Table 4 presents groundwater elevations measured in wells during the 2024 monitoring events. A groundwater flow map was prepared using water level measurements from each semiannual monitoring event for both the shallow and deep portions of the alluvial aquifer (Figures 3.1 through 3.6).

The groundwater contour maps show the groundwater flow direction in the shallow portion of the alluvial aquifer and the localized effect that an area of low permeability materials may have on the groundwater flow direction, provided on Figures 3.1, 3.3, and 3.5. Higher groundwater elevations are observed in areas of low permeability sediments that result in local variations in flow directions. However, the predominant site-wide flow direction is west-southwest, toward the Missouri River. Groundwater mounding is observed around monitoring wells MW-19 and MW-21.

Figures 3.2, 3.4, and 3.6 illustrate the southwesterly groundwater flow direction in the deeper portion of the alluvial aquifer. MW-20 is screened in fine-grained material, whereas other deep alluvial aquifer monitoring wells are screened in sand. For this reason, MW-20 was excluded from development of the deep alluvial groundwater contours (Figures 3.2, 3.4, and 3.6). Groundwater flow in the shallow and deep portions of the alluvial aquifer is generally southwest, toward the Missouri River.

3.3 Horizontal Gradient and Groundwater Flow Velocity

Hydraulic conductivity estimates for the shallow alluvial aquifer at the Neal North Monofill range from a low of approximately 0.3 meter per day (m/day) to 12.0 m/day (MWH, 2006). Hydraulic conductivity estimates for the deep alluvial aquifer at the Neal North Monofill range from a low of approximately 2.4 m/day to 28.4 m/day (MWH, 2006).

The geometric mean hydraulic conductivity for the shallow and deep portions of the alluvial aquifer is 2.3 m/day and 12.2 m/day, respectively (MWH, 2006).

The average horizontal linear groundwater velocity for both portions of the alluvial aquifer was estimated based on hydraulic conductivity, horizontal gradient, and the estimated porosity of the formation using the following equation:

$$V = Ki/n$$

Where V equals the average horizontal linear velocity; K equals the geometric mean hydraulic conductivity (2.3 m/day and 12.2 m/day for shallow and deep portions of the aquifer, respectively); i equals the average horizontal hydraulic gradient; and n equals the effective porosity (estimated at 0.3).

In order to consistently assess groundwater horizontal gradient and flow velocity, gradient was determined between well pairs that have been observed to consistently lie along flow paths. In the shallow portion of the alluvial aquifer, the horizontal gradient was estimated along the groundwater flow path between monitoring wells MW-13R and MW-11R. The gradient in the deeper portion of the alluvial aquifer was determined between monitoring wells MW-30 and MW-6 for the 2024 monitoring events.

During the three 2024 gauging events at the Neal North CCR Monofill, the average linear groundwater velocity was estimated to range between 0.006 m/day (approximately 7 feet per year) during the June 2024 monitoring event and 0.010 m/day (approximately 13 feet per year) during the March 2024 monitoring events in the shallow portion of the alluvial aquifer. The average linear groundwater velocity in the deeper portion of the alluvial aquifer was estimated to range between 0.023 m/day (approximately 27 feet per year) during the June 2024 monitoring event and 0.044 m/day (approximately 53 feet per year) during the March 2024 monitoring event.

3.4 Vertical Hydraulic Gradient

Water levels measured in monitoring well pairs during the 2024 monitoring events were used to calculate vertical hydraulic gradient using the equation listed below.

$$\text{Water Elevation in Deep Well} - \text{Water Elevation in Shallow Well}$$

Elevation of Middle of Saturated Zone of Shallow Well Screen – Elevation of Middle of Saturated Zone of Deep Well Screen

The difference in groundwater elevations between nested pairs of wells ranged from 0.02 to 0.72 feet at wells pairs MW-3R/MW-4, MW-5R/MW-6, MW-11/MW-12, MW-13/MW-14, MW-23/ MW-24, MW-27/MW-28, MW-29/MW-30, and MW-56/MW-57, to often in excess of several feet at well pairs MW-19/MW-20, MW-21/MW-22, MW-25/MW-26, and MW-31/MW-32, locations where shallow wells were screened in low conductivity sediments. The maximum difference of 15.21 feet was observed at the MW-21/MW-22 well pair during the June 2024 gauging event.

Vertical hydraulic gradients generally ranged from -0.041 feet/foot (ft/ft) downward to 0.016 ft/ft upward during recent gauging events at most locations with nested well pairs. However, downward gradients greater than -0.1 ft/ft were observed in several locations with significant deposits of shallow, poorly drained low permeability materials; in these locations, shallow groundwater levels were elevated relative to the surrounding higher permeability alluvial aquifer (MW-19/MW-20, MW-21/MW-22, MW-25/MW-26, and MW-31/MW-32), with downward gradients as high as -0.507 ft/ft. One well pair with significant deposits of low permeability materials (MW-25/MW-26) had an upward vertical gradient observed in June 2024 (0.019 ft/ft) and September 2024 (0.044 ft/ft).

3.5 Monitoring Well Network Assessment

The Closed Monofill monitoring network meets the Federal CCR rule requirements of having at least one upgradient monitoring well and three downgradient monitoring wells, and the groundwater monitoring network meets the design and construction requirements of 40 CFR §257.91. Shallow alluvial aquifer monitoring wells MW-13R, MW-27, MW-29R, MW-223S, and MW-231SR have been identified as upgradient background sampling locations.

3.6 Leachate and Landfill Gas

The Closed Monofill does not have a leachate collection system or landfill gas monitoring (Table 11 and Table 12).

4. Groundwater Monitoring

Groundwater sample collection records are provided in Appendix A and the associated laboratory analytical reports are provided in Appendix B. Appendix C includes time series graphs of concentration versus time for each analyte in the current monitoring program. Analytical results for groundwater samples collected during the eight baseline monitoring events (September 2020 through June 2022) are summarized in Table D.1. The analytical results from the 2024 monitoring events are summarized in Table D.2. These tables, as well as Tables D.3 through D.6, are provided in Appendix D. Further analysis of data from the Closed CCR Monofill is presented in Table 5 through Table 10 and is discussed throughout this section.

Following the assessment and reporting requirements under the Federal CCR rule, groundwater monitoring data are subjected to statistical evaluation to demonstrate compliance with monitoring goals. Evaluation components include:

- Statistical summaries for the data sets obtained (on a per-well, per-parameter basis)
- Preparation of trend plots (concentration vs. time)
- Inter-well comparisons (downgradient vs. upgradient background)
- Intra-well comparisons (vs. baseline conditions at a given well)

The statistical methods used in these evaluation steps for the Neal North Monofill are presented in the Groundwater Statistical Methods Certification (Methods Certification) (GHD, 2017). The procedures in the Methods Certification were selected in accordance with the Federal CCR rule, utilizing methodology presented in the USEPA's *Statistical Analysis of Groundwater Monitoring Data at RCRA Facilities – Unified Guidance* (Unified Guidance) (USEPA, 2009). The present evaluation utilizes the statistical methods presented therein to evaluate monitoring data from groundwater samples collected during the 2024 assessment and verification monitoring events.

Baseline monitoring under the Federal CCR rule occurred at the Neal North Closed Monofill during eight monitoring events conducted between September 2020 and June 2022. These first eight events represent the selected baseline period required for both inter-well and intra-well comparisons. Although the Closed Monofill shares the same upgradient background wells with the Neal North Impoundment 3B and Active Monofill, a new baseline monitoring period was completed (September 2020 and June 2022) to coincide with the initiation of sampling under the 2020 HMSP for the Closed Monofill.

4.1 Statistical Analysis Approach

The initial eight rounds of baseline groundwater monitoring data were collected and analyzed for the 40 CFR Part 257 Appendix III and IV constituents (Table 5). One constituent (fluoride) is listed in both the Appendix III and IV constituent lists in the Federal CCR rule. In the present evaluation, fluoride has been included with the Appendix III parameters and is not duplicated again with the other Appendix IV parameters in the various figures and tables of results.

The baseline and 2024 assessment and verification monitoring data for the Neal North Closed Monofill are presented in Tables D.1 and D.2, respectively. Statistical summary information for each data set is provided along with trend analysis results in Tables D.3 (inter-well baseline) and Table D.4 (intra-well baseline).

Groundwater monitoring at the Neal North Closed Monofill is currently conducted under Assessment Monitoring status per the Federal CCR rule. The Closed Monofill is not in an IDNR Groundwater Quality Assessment program so no trend analyses were conducted (Table 10). For downgradient wells, lithium and cobalt at MW-19 were the only confirmed detections at statistically significant levels (SSLs) above the maximum contaminant level (MCL) or

applicable groundwater protection standard (GWPS). The remaining detections above background at downgradient well locations are not confirmed and/or are below the site-specific GWPS. In Tables 6 and 7, background wells with confirmed control limit exceedances are not included but are summarized in Tables 9 and D.6.

No single method of statistical analysis is appropriate for each groundwater constituent dataset; instead, the statistical methods selected for use are dependent upon the data and distributions and should consider the specific constituents and the nature of local hydrogeologic conditions. Depending on characteristics of the site and the groundwater monitoring data, a mix of inter-well (comparison vs. upgradient background conditions) and intra-well (comparison vs. baseline) tests may be warranted. The statistical methods used for the inter-well and intra-well approaches are selected based on these factors as well as consideration of natural temporal or spatial variability of the concentrations of the groundwater constituents. Substantial natural spatial variability may necessitate intra-well methods. This statistical analysis was completed using both inter-well and intra-well approaches for the purpose of determining if a statistically significant increase (SSI) relative to baseline concentrations has occurred at the Neal North Closed Monofill.

A preliminary statistical analysis of baseline data was conducted to initially assess the constituent data and determine the most appropriate statistical approach(es) for the data. The data were examined for outliers, the percentage of non-detect values, and to determine the statistical data distribution. Time series plots, box plots of upgradient background data, and maps were used to evaluate the potential presence of temporal or spatial variations in constituent concentrations.

All of the Appendix III and IV constituents occur naturally in the environment. For constituents that occur naturally and may vary substantially in concentration across the monitoring network due to natural hydrogeologic or geochemical factors (i.e., exhibiting spatial variability), an inter-well analysis is not appropriate. Constituent concentrations greater than upgradient background conditions might be incorrectly attributed to impact from the Neal North Closed Monofill, when the differences are actually natural and unrelated to the Neal North Closed Monofill due to locally varying distributions of groundwater constituents. In such cases, an intra-well approach is appropriate.

4.1.1 Spatial Variability

The concentration of naturally occurring constituents such as the Appendix III and IV constituents can be affected by the presence of differing aquifer material or geochemistry between monitoring well locations. At the Neal North Monofill, the uppermost groundwater occurs in alluvial deposits, which consist primarily of sands with finer-grained silts and clays. The natural geochemistry of groundwater can vary between these zones and affect the detected concentrations of natural constituents. In the case of the Neal North Monofill, these differing geological materials are intersected by the screened zones of the monitoring wells and may result in spatial variability for some constituents. Box plots, provided in the 2022 AWQR (GHD, 2023), were used to evaluate spatial variability between the upgradient wells.

The presence of spatial variability among the Neal North Closed Monofill upgradient wells (MW-13R, MW-27, MW-29R, MW-223S, and MW-231SR) is evident for many detected constituents during the new baseline period. If no spatial variability is present, the mean and distribution between the upgradient wells would be similar. In contrast, there is strong evidence of spatial variability between wells where interquartile ranges do not overlap, in particular:

- MW-13R and MW-223S appear to have lower concentrations of boron than MW-29R, MW-27, and MW-231SR
- MW-223S has lower concentrations of calcium, TDS, and lithium than MW-13R, MW-27, MW-29R, and MW-231SR
- MW-231SR has higher sulfate than MW-13R, MW-27, MW-29R, and MW-223S
- MW-223S has higher pH than MW-13R, MW-27, MW-29R, and MW-231SR
- MW-27 and MW-231SR has lower barium concentrations than MW-13R, MW-29R, and MW-223S

For these constituents, there are observed substantial differences in constituent concentrations in groundwater between the upgradient background wells (MW-13R, MW-27, MW-29R, MW-223S, and MW-231SR). This spatial variability invalidates inter-well comparisons for downgradient wells, since observed differences between

downdgradient and upgradient conditions could be due to natural variability or could be due to effects of the Neal North Closed Monofill. An inter-well comparison could not distinguish between these two possibilities.

4.1.2 Temporal Variability

The Federal CCR rule considers the occurrence of temporal trends in groundwater monitoring data. Where trends are observed, the statistical method selected must take these into account.

For inter-well baseline Upper Tolerance Limits (UTLs), where data from upgradient wells (MW-13R, MW-27, MW-29R, MW-223S, and MW-231SR) were combined, trends were assessed using the Regional Kendall test. This test is a modified Seasonal Kendall test described in detail in USEPA, 2009, Section 14.3.4, substituting the individual wells in the place of the separate seasons. In the test, individual Mann-Kendall statistics are calculated for each analyte at each well separately, and then summed to perform the overall test.

For these constituents, the statistically significant trends impact or invalidate inter-well comparisons, since the statistical methods presented in the Federal CCR rule (40 CFR 257.93 (f)) assume no trends are present in the upgradient data. Further analysis of temporal variability is provided in Section 4.2.1.

4.1.3 Summary of Statistical Analysis Approach

The statistical analysis included both inter-well and intra-well approaches for the purpose of determining if SSIs in constituent concentrations in groundwater have occurred at the Neal North Closed Monofill. This approach could change as additional data are collected during future monitoring. If new information warrants such a change, a modification to the statistical approach will be recommended for one or more constituents and/or monitoring wells.

4.2 Assessment of Baseline Data

Per the Methods Certification, each of the baseline data sets was subjected to initial screening and assumption checking, considering the following items:

- i. The presence of censored data (i.e., percentage of non-detect results)
- ii. The observed data distribution (i.e., normal, gamma, lognormal, or unknown)
- iii. The presence of statistical outliers
- iv. Consideration of field duplicate results

The specific methods employed are described in the Methods Certification. The assumption-checking results for each data set (constituent by well) are presented in Table D.4.

4.2.1 Stability Assessment/Baseline Period Trend Analysis

The assessment of temporal trends is included as a precursor to intra-well and inter-well comparisons, as the statistical methods for these comparisons assume that a stable condition is present in the reference data set (i.e., the baseline period for intra-well comparisons, and the upgradient background data set for inter-well comparisons). Where a trend is identified, the comparison procedures must be adjusted to take this into account. Trend tests may also be used as an alternative intra-well comparison procedure when other methods are not appropriate (as noted at the beginning of Section 17.3 of the Unified Guidance [USEPA, 2009]).

The Methods Certification selects two statistical procedures for evaluating trends in the baseline data, namely:

- i. The Mann-Kendall Trend Test
- ii. The Theil-Sen Median Slope (for data sets identified as having a statistically significant temporal trend by the Mann-Kendall Test)

The applicability and methodology for these procedures are discussed in the Methods Certification. In carrying out the trend tests, a target significance level of 0.05 (i.e., 95 percent confidence) was selected. This significance level is

applied on a per-location, per-parameter basis, for all suitable data sets. The Federal CCR rule (40 CFR 257.93 (g)(2)) specifies that a significance level no lower than 0.01 (99 percent confidence) may be applied for individual comparisons, with an overall (site-wide) minimum significance level of 0.05. For current trend screening purposes, a significance level of 0.05 was selected to increase the statistical power of detecting potential trends with data sets containing only eight baseline samples (which is the number of baseline events specified in the Federal CCR rule). Non-detects were accommodated as described in the Methods Certification, considering these to be tied and lower than non-detects in the Mann-Kendall Test, and conservatively substituting the detection limit where needed for calculating the Thiel-Sen median slope.

The baseline data sets presented in Table D.1 were subjected to trend testing as described above. The results of these tests are presented, along with summary statistics, in Table D.4. The trend test findings are also included on trend plots, which are presented in Appendix C, Figures 1 through 10. Note that in the trend plots, field duplicate results are included as discrete points, but in the trend analyses these were averaged prior to trend calculations.

There are a total of 210 baseline data sets that were considered (21 monitoring constituents at each of the 10 wells). Out of these, 74 data sets are comprised entirely of non-detect results. These occur mainly for the following constituents:

- Antimony (all 10 wells)
- Beryllium (all 10 wells)
- Chromium (all 10 wells)
- Fluoride (5 wells)
- Lead (7 wells)
- Mercury (all 10 wells)
- Selenium (7 wells)
- Thallium (8 wells)

Additional constituents with at least one well having no detected results during baseline sampling are arsenic (1 well), cadmium and molybdenum (3 wells each).

There are 23 baseline period data sets containing one or more detected results but having a non-detect frequency greater than 50 percent and were therefore not subjected to trend testing.

The remaining 113 data sets were subjected to trend analysis using the Mann-Kendall Test. The majority of the tests (103 of 113 data sets, or 91 percent) indicated that no statistically significant trends over time were present during the baseline period. Four (4) decreasing trends and six (6) increasing trends were found.

Increasing trends were found for the following wells/constituents:

- Chloride at MW-1R, MW-13R, MW-27, MW-29R, MW-223S, and MW-231SR

Decreasing trends were found for the following wells/constituents:

- Boron at MW-27
- Cobalt at MW-1R and MW-3R
- TDS at MW-3R

Additionally, there are several data sets noted where there is less confidence of a trend over time (having statistical confidence less than 95 percent but greater than 90 percent), as noted in the comments in Table D.4.

Where trends have been identified in a baseline data set, the methods for intra-well and inter-well comparisons performed below were adjusted to account for non-stationarity during the baseline period.

4.2.2 Inter-well Comparisons – Upgradient Background Values

The Federal CCR rule provides a list of alternate statistical procedures applicable to inter-well and intra-well comparisons (see 40 CFR §257.93(f)). In the Methods Certification, the use of upper tolerance limits (UTLs) was selected for assessment of groundwater monitoring data for the Neal North Closed Monofill. A UTL is a statistically-based limit above which a given sample measurement is unlikely to occur if conditions are consistent with the reference population. For inter-well comparisons, the reference population is the data set of constituent concentrations in upgradient background well(s). Since there are five upgradient background wells (MW-13R, MW-27, MW-29R, MW-223S, and MW-231SR), the data from these five wells have been pooled to calculate the upgradient background UTLs for each constituent.

Statistical UTLs have two descriptive parameters: (i) their coverage; and (ii) their confidence. Coverage refers to the percentage of the reference population that is within the tolerance limit. For example, if a coverage of 0.99 is selected, then 99 percent of the reference population will be within the tolerance limit (which in the case of a one-sided UTL, represents the 99th percentile of the reference population). Confidence refers to the probability that the specified coverage based on the samples collected will include the true value from the entire population. For example, if a 95 percent confidence level is selected, then there is no more than a 5 percent probability that the calculated UTL will not provide the selected coverage (e.g., true 99th percentile) of the population.

In Section 5 of the Methods Certification, two type of UTLs are specified:

- i. A 95/95 UTL, which has a coverage of 0.95 (i.e., 95th percentile) with 95 percent confidence
- ii. iA 99/95 UTL, which has a coverage of 0.99 (i.e., 99th percentile) with 95 percent confidence

Comparisons against these UTLs are to be interpreted as follows:

- a. If a given future observation exceeds a 95/95 UTL, but not a 99/95 UTL, the next regularly scheduled monitoring event will be used as the verification resample for determining an SSI.
- b. If a given future observation exceeds both the 95/95 and 99/95 UTLs, then a verification resample or other appropriate response will be undertaken prior to the next regularly scheduled monitoring event.

An SSI is only identified after an original sample and its verification resample (either the next regularly scheduled sample or a special verification sample) exceed the given UTL.

Calculations of UTLs for inter-well comparisons were completed using the logic and methodology presented in USEPA's Technical Guide for its ProUCL software (USEPA, 2022, version 5.2). The results of the inter-well UTL calculations are provided in Table D.3.

4.2.3 Intra-well Comparisons – Well-specific Baseline Values

As noted in the Methods Certification, the statistical methods (i.e., UTLs) for intra-well comparisons are analogous to those for inter-well comparisons. In this case, the reference population is the data set of constituent concentrations in a given well observed during the baseline period. Calculation of the upgradient background 95/95 UTL and 99/95 UTL values is performed using the same methods used for the inter-well comparisons.

Where temporal trends were identified over the baseline period, tolerance limits are not calculated (due to violation of the statistical assumptions of the UTL calculations) and a baseline range is provided as a reference. For such data sets, future sample results are to be compared both against the baseline range and what would be expected based on the observed trend over the baseline period.

The calculated updated intra-well baseline values (UTLs) for each constituent at each well are provided in Table D.4.

4.3 Evaluation of 2024 Groundwater Monitoring Data

4.3.1 Appendix III Analytes

The Appendix III constituent data sets from sampling conducted during 2024 are presented in Table 8 and Table D.2 and summarized below. The historical and current Appendix III monitoring data is compared against the background level and GWPS in Table 9.

- Boron. No MCL has been established for boron. The maximum boron concentration detected in 2024 was 0.606 milligrams per liter (mg/L) at MW-19 (March 2024).
- Calcium. No MCL has been established for calcium. The maximum calcium concentration detected in 2024 was 510 mg/L at well MW-21 (March 2024).
- Chloride. No MCL has been established for chloride. The maximum chloride concentration detected in the 2024 monitoring events was 116 mg/L at upgradient location MW-231SR (September 2024). MW-1R (61.8 mg/L in September 2024) was the maximum chloride concentration detected at downgradient monitoring well locations.
- Fluoride. The MCL for fluoride is 4.0 mg/L. All wells were below the associated reporting limit (1.00 mg/L and 0.200 mg/L, depending on sample).
- pH. No MCL has been established for pH. The lowest and highest pH measurement recorded in 2024 were 6.6 J at MW-19 (September 2024) and 8.0 J at monitoring wells MW-1R (March 2024), MW-3R (March 2024), and MW-5R (March 2024), respectively.
- Sulfate. No MCL has been established for sulfate. The maximum sulfate concentration detected in 2024 was 1,590 mg/L at MW-21 (March 2024).
- Total Dissolved Solids (TDS). No MCL has been established for TDS. The maximum TDS concentration in 2024 was 2,890 mg/L at MW-21 (March 2024).

4.3.2 Appendix IV Analytes

The March, June, and September 2024 Appendix IV results are presented in Table 8 and Table D.2 and summarized below. The historical and current Appendix IV monitoring data is compared against the background level and GWPS in Table 9.

- Antimony. Antimony was not detected above the method reporting limit (0.00200 mg/L) or the established MCL (0.006 mg/L) in samples from any monitoring well during the 2024 monitoring events.
- Arsenic. The site-specific GWPS for arsenic is the maximum background concentration (0.0512 mg/L) because the background concentration is higher than arsenic MCL of 0.010 mg/L. Arsenic was detected at all wells during the 2024 monitoring events, except at MW-21 (March and September 2024) and MW-231SR (September 2024). The maximum concentration detected was 0.0955 mg/L at downgradient well MW-1R, which is above the site-specific GWPS. The subsequent sample from MW-1R in June 2024 was below the site-specific GWPS (0.0464 mg/L). The March 2024 arsenic result of 0.0521 mg/L at background well MW-13R also exceeded the site-specific GWPS and was followed by a result below the GWPS in September 2024. At background well MW-27, both March 2024 (0.0591 mg/L) and September 2024 (0.0663 mg/L) exceeded the arsenic GWPS.
- Barium. The MCL for barium is 2.0 mg/L. Barium was detected in all of the monitored wells in 2024 with a maximum concentration of 0.296 mg/L at downgradient location MW-3R in March 2024, which is below the MCL.
- Beryllium. Beryllium was not detected above the method reporting limit (0.00100 mg/L) or the established MCL (0.004 mg/L) in samples from any monitoring well during the 2024 monitoring events.
- Cadmium. The method reporting limit for cadmium is 0.000200 mg/L and the MCL is 0.005 mg/L. Cadmium was not detected above the reporting limit at any monitoring well during the 2024 monitoring events.
- Chromium. Chromium was not detected above the method reporting limit (0.00500 mg/L) or the established MCL (0.1 mg/L) in any monitoring well during the 2024 monitoring events.

- Cobalt. No MCL has been established for cobalt; the GWPS established under 40 CFR §257.95(h)(2) for cobalt is 0.006 mg/L. The maximum concentration detected was 0.0127 mg/L at MW-19 in September 2024, which is above the GWPS. The March 2024 result (0.00755) was also greater than the GWPS.
- Lead. No MCL has been established for lead; the GWPS established under 40 CFR §257.95(h)(2) for lead is 0.015 mg/L. All wells were below the method reporting limit (0.000500 mg/L) during the 2024 monitoring events.
- Lithium. No MCL has been established for lithium; the GWPS established under 40 CFR §257.95(h)(2) for lithium is 0.040 mg/L; and the background concentration in groundwater is 0.205 mg/L. Since the site-specific background concentration is higher than the 40 CFR §257.95(h)(2) value for lithium, the site-specific GWPS for lithium is 0.205 mg/L. Lithium was detected in all wells during the 2024 monitoring events. The maximum concentration detected was 0.328 mg/L at MW-21 (March 2024), which is above the background concentration and the site-specific GWPS, but the September 2024 result (0.205 mg/L) did not exceed the GWPS. The March 2024 (0.239 mg/L) and September 2024 (0.255 mg/L) results of lithium at MW-19 also exceeded the site-specific GWPS.
- Mercury. Mercury was not detected above the method reporting limit (0.000200 mg/L) or the established MCL (0.002 mg/L) in samples from any monitoring well during the 2024 monitoring events.
- Molybdenum. No MCL has been established for molybdenum; the GWPS established under 40 CFR §257.95(h)(2) for molybdenum is 0.100 mg/L. Molybdenum was detected in the majority of wells during 2024, except at MW-19, MW-21, MW-27, MW-29 (September 2024), and MW-231SR (September 2024). The maximum concentration detected was at MW-1R, which had a concentration of 0.00508 mg/L in March 2024. This concentration is below the GWPS.
- Radium 226 and 228 (combined). Radium 226 and 228 (combined) was not detected above the established MCL of 5 picocuries per liter (pCi/L) in any of the wells during the 2024 monitoring events. Radium 226 and 228 (combined) was detected in all wells during all monitoring events in 2024 except at MW-5R, MW-19, MW-21, and MW-223S in March 2024. The highest concentration detected during the 2024 events was 2.98 pCi/L at MW-231SR in March 2024.
- Selenium. The MCL for selenium is 0.05 mg/L. Majority of selenium concentrations were below the method reporting limit (0.00500 mg/L) during the 2024 monitoring events except at MW-19 (March 2024), MW-21 (September 2024), and MW-231SR (January and September 2024). The maximum detected selenium concentration was 0.191 mg/L at MW-21 in September 2024, which is above the MCL. This result will be verified during the next sampling event.
- Thallium. The MCL for thallium is 0.002 mg/L. All wells were below the method reporting limit (0.00100 mg/L) for thallium during the 2024 monitoring events.

4.3.3 Inter-well Comparisons (vs. Upgradient Background)

Inter-well comparisons of current monitoring data are conducted by comparing monitoring data from the 2024 sampling events to the upgradient background UTLs derived from the baseline period data (September 2020 through June 2022). These comparisons are presented in Table D.5. A further comparison of newly identified as well as ongoing inter-well background exceedances are presented in Table 6 and Table 7, respectively.

The results of the inter-well comparisons identify observations at the five downgradient monitoring wells where the 2024 monitoring events had a constituent concentration or measurement outside of baseline conditions represented by the upgradient background wells (MW-13R, MW-27, MW-29R, MW-223S, and MW-231SR). These include:

- Arsenic at MW-1R
- Boron at MW-1R, MW-3R, and MW-19
- Calcium at MW-19 and MW-21
- Chloride at MW-1R
- Cobalt at MW-19
- Lithium at MW-19 and MW-21

- Molybdenum at MW-1R and MW-5R
- pH at MW-1R, MW-3R, MW-5R, and MW-19
- Selenium at MW-21
- Sulfate at MW-19 and MW-21
- TDS at MW-19 and MW-21

Several concentrations exceeding the inter-well background were confirmed with two successive samples above the UTL. The following samples from March 2024 were not confirmed in the subsequent sampling event:

- Arsenic at MW-1R
- Calcium at MW-21
- Lithium at MW-21
- pH at MW-1R, MW-3R, and MW-5R
- Sulfate at MW-21
- TDS at MW-21

Remaining unconfirmed SSIs observed during the September 2024 sampling event (boron and chloride at MW-1R; selenium at MW-21) will be confirmed during the next sampling event.

4.3.4 Intra-well Comparisons (vs. Well-Specific Baseline Values)

Intra-well comparisons of current monitoring data are conducted by comparing monitoring results from the 2024 sampling events to the baseline period (September 2020 through June 2022) UTLs for each given well. These comparisons are presented in Table D.6.

The results of the intra-well comparisons indicate that the Appendix III and IV constituent concentrations were not above those observed during the baseline period with a few exceptions. These include:

- Arsenic at MW-27 (upgradient), MW-223S (upgradient), MW-231SR (upgradient), and MW-1R
- Barium at MW-27 (upgradient), MW-231SR (upgradient)
- Boron at MW-223S (upgradient)
- Calcium at MW-223S (upgradient)
- Chloride at MW-223S (upgradient) and MW-231SR (upgradient)
- Cobalt at MW-231SR (upgradient) and MW-1R
- Molybdenum at MW-231SR (upgradient)
- pH at MW-1R, MW-3R, MW-5R, MW-19, and MW-21
- Radium-226 & 228 (combined) at MW-231SR (upgradient)
- Selenium at MW-19 and MW-21
- Sulfate at MW-223S (upgradient)
- TDS at MW-223S (upgradient)

All exceedances of intra-well baseline values were at upgradient locations except arsenic (MW-1R), cobalt (MW-1R), pH (MW-1R, MW-3R, MW-5R, MW-19, and MW-21), and selenium (MW-19 and MW-21). Of these SSIs, arsenic at MW-27, barium at MW-27, boron at MW-223S, and calcium at MW-223S are confirmed with two successive samples above the UTL. Unverified SSIs that did not exceed in the immediately following sampling event include:

- Arsenic at MW-223S, MW-231SR, and MW-1R
- Barium at MW-231SR
- Molybdenum at MW-231SR
- pH at MW-1R, MW-3R, MW-5R, MW-19, and MW-21

- Radium-226 & 228 (combined) at MW-231SR
- Selenium at MW-19
- Sulfate at MW-223S
- TDS at MW-223S

The remaining unconfirmed SSIs will be verified during the next sampling event.

5. Conclusions and Recommendations

5.1 Groundwater Flow and Evaluation of the Monitoring Network

Groundwater flow in the shallow and deep portions of the alluvial aquifer in the vicinity of the Neal North Monofill is predominantly to the west-southwest, toward the Missouri River. The shallow alluvial groundwater contour maps (Figures 3.1, 3.3, and 3.5) show the localized effect an area of low permeability materials may have on the groundwater flow direction.

The groundwater flow evaluation (see Figures 3.1 through 3.6) indicates the monitoring network is sufficient and has appropriately located upgradient and downgradient well locations. The predominant flow direction was observed to be to the southwest, toward the Missouri River.

5.2 Groundwater Quality

A statistical evaluation of groundwater monitoring data collected during the baseline period (September 2020 to June 2022) has been conducted in accordance with the Federal CCR rule and Unified Guidance for assessing groundwater data (USEPA, 2009). This evaluation was successful in characterizing the baseline data sets, assessing the baseline data for trends, and generating inter-well upgradient background reference values and intra-well baseline values against which future monitoring data may be evaluated.

Additionally, an assessment of monitoring data from samples collected were analyzed for the parameters specified in 40 CFR Part 257 Appendix III and Appendix IV analytes for the monitoring events completed in March and September 2024.

Key results of the evaluation include:

- Constituent concentrations appear to vary between the upgradient background wells. Assessment of the baseline period data indicates significant spatial variability in groundwater collected at different monitoring wells at the site, requiring intra-well comparisons.
- Significant concentration trends over time were observed in some baseline data sets at both downgradient wells and upgradient wells.
- Inter-well baseline values (UTLs) have been calculated from the baseline data for five upgradient background wells (MW-13R, MW-27, MW-29R, MW-223S, and MW-231SR).
- Intra-well baseline values (UTLs) have been calculated on a per-constituent, per-well basis for Appendix III and Appendix IV constituents.
- Assessment of the 2024 monitoring events data indicates that:
 - Inter-well comparisons - The monitoring results at downgradient wells are mainly consistent with upgradient background conditions during the baseline period but remain elevated for one or more constituents at three of the five downgradient wells (molybdenum at MW-1R; boron at MW-3R;

molybdenum at MW-5R; boron, calcium, cobalt, lithium, pH, sulfate, and/or TDS at MW-19). These SSIs, as well as the unconfirmed SSIs noted in Section 4.3.3, will be assessed by future sampling.

- Intra-well comparisons – All upgradient locations, except MW-13R and MW-29R, exceeded their corresponding intra-well baseline value for one or more constituents (arsenic, barium, boron, calcium, chloride, cobalt, molybdenum, radium-226 &228 (combined), sulfate, and/or TDS) during at least one sampling event in 2024. One unconfirmed SSI for selenium at downgradient location MW-21 will be verified during the next sampling event.
- The MCL or GWPS was exceeded for the following constituents and downgradient locations:
 - Arsenic (site-specific GWPS) at MW-1R in March 2024 but not June or September 2024
 - Cobalt (GWPS) at MW-19 in March and September 2024
 - Lithium (site-specific GWPS) at MW-19 in March and September 2024
 - Lithium (site-specific GWPS) at MW-21 in March 2024
 - Selenium (MCL) at MW-21 in September 2024
- The MCL or GWPS was exceeded for the following constituents and upgradient locations:
 - Arsenic (site-specific GWPS) at background location MW-13R in March 2024 but not September 2024
 - Arsenic (site-specific GWPS) at background location MW-27 in March and September 2024

5.3 Recommendations

Currently, the Neal North Closed Monofill remains in assessment monitoring. No changes to the monitoring network or sampling procedures are necessary.

Comments:

^a Maximum contaminant level (MCL).

^b Groundwater protection standard (GWPS) established under 40 CFR 257.95(h)(2).

Bolded constituents indicate background levels are higher than the Action Level.

Table 6

Summary of Well/Detected Constituent Pairs With No Immediately Preceding Control Limit Exceedances

**2024 Annual Water Quality Report
Neal North Energy Center - Closed CCR Monofill
Permit No. 97-SDP-12-95P**

Well	Constituent	Units	Most recent result	Control Limit
MW-1R	N/A	--	--	--
MW-3R	Boron	mg/L	0.405	0.386
MW-5R	N/A	--	--	--
MW-19	N/A	--	--	--
MW-21	N/A	--	--	--

Comments:

Table reflects verified new control limit exceedances in downgradient well locations only.

Any background well with verified new control limit exceedances are not included in this table.

Comments:

Groundwater Protection Standard (GWPS) established under 40 CFR §257.95(h).

ns - MW-13 and MW-29 were not sampled in February or May 2021 due to low water levels.

na - Constituent not analyzed.

Grey shading indicates exceedance of the 95/95 UTL background concentration; black shading indicates exceedance of the site-specific GWPS.

JOB DESCRIPTION

MEC Neal North-Background
MEC Neal North-Background

JOB NUMBER

310-277134-1

Eurofins Cedar Falls

Job Notes

This report may not be reproduced except in full, and with written approval from the laboratory. The results relate only to the samples tested. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

The test results in this report relate only to the samples as received by the laboratory and will meet all requirements of the methodology, with any exceptions noted. This report shall not be reproduced except in full, without the express written approval of the laboratory. All questions should be directed to the Eurofins Environment Testing North Central, LLC Project Manager.

Job ID: 310-277134-1

Job ID: 310-277134-1

Eurofins Cedar Falls

Job Narrative 310-277134-1

Analytical test results meet all requirements of the associated regulatory program listed on the Accreditation/Certification Summary Page unless otherwise noted under the individual analysis. Data qualifiers are applied to indicate exceptions. Noncompliant quality control (QC) is further explained in narrative comments.

- Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD may be performed, unless otherwise specified in the method.
- Surrogate and/or isotope dilution analyte recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in the narrative.

Regulated compliance samples (e.g. SDWA, NPDES) must comply with the associated agency requirements/permits.

Receipt

The samples were received on 3/20/2024 9:20 AM. Unless otherwise noted below, the samples arrived in good condition, and, where required, properly preserved and on ice. The temperatures of the 4 coolers at receipt time were -0.1°C, 0.6°C, 1.8°C and 4.1°C.

HPLC/IC

Method 9056A_ORGFM_28D: The following samples were diluted due to the nature of the sample matrix: MW13R-GW-0324 (310-277134-1), MW27-GW-0324 (310-277134-2), MW29R-GW-0324 (310-277134-3) and DP01-GW-0324 (310-277134-6). Elevated reporting limits (RLs) are provided.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Metals

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

General Chemistry

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Job ID: 310-277134-1

Qualifiers

HPLC/IC

Qualifier	Qualifier Description
F1	MS and/or MSD recovery exceeds control limits.

Metals

Qualifier	Qualifier Description
4	MS, MSD: The analyte present in the original sample is greater than 4 times the matrix spike concentration; therefore, control limits are not applicable.
F1	MS and/or MSD recovery exceeds control limits.
F2	MS/MSD RPD exceeds control limits

General Chemistry

Qualifier	Qualifier Description
HF	Parameter with a holding time of 15 minutes. Test performed by laboratory at client's request. Sample was analyzed outside of hold time.

Rad

Qualifier	Qualifier Description
U	Result is less than the sample detection limit.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
%	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Accreditation/Certification Summary

Client: GHD Services Inc.

Job ID: 310-277134-1

Project/Site: MEC Neal North-Background

Laboratory: Eurofins Cedar Falls

Unless otherwise noted, all analytes for this laboratory were covered under each accreditation/certification below.

Authority	Program	Identification Number	Expiration Date
Iowa	State	007	12-01-25

The following analytes are included in this report, but the laboratory is not certified by the governing authority. This list may include analytes for which the agency does not offer certification.

Analysis Method	Prep Method	Matrix	Analyte
6020B	3005A	Water	Lithium

Laboratory: Eurofins St. Louis

Unless otherwise noted, all analytes for this laboratory were covered under each accreditation/certification below.

Authority	Program	Identification Number	Expiration Date
Iowa	State	373	12-01-24

The following analytes are included in this report, but the laboratory is not certified by the governing authority. This list may include analytes for which the agency does not offer certification.

Analysis Method	Prep Method	Matrix	Analyte
9315	PrecSep-21	Water	Radium-226
9320	PrecSep_0	Water	Radium-228
Ra226_Ra228		Water	Combined Radium 226 + 228

Login Sample Receipt Checklist

Client: GHD Services Inc.

Job Number: 310-277134-1

Login Number: 277134

List Source: Eurofins Cedar Falls

List Number: 1

Creator: Homolar, Dana J

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	N/A	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

Eurofins Cedar Falls

Job Notes

This report may not be reproduced except in full, and with written approval from the laboratory. The results relate only to the samples tested. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

The test results in this report relate only to the samples as received by the laboratory and will meet all requirements of the methodology, with any exceptions noted. This report shall not be reproduced except in full, without the express written approval of the laboratory. All questions should be directed to the Eurofins Environment Testing North Central, LLC Project Manager.

Job ID: 310-277418-1

Job ID: 310-277418-1

Eurofins Cedar Falls

Job Narrative 310-277418-1

Analytical test results meet all requirements of the associated regulatory program listed on the Accreditation/Certification Summary Page unless otherwise noted under the individual analysis. Data qualifiers are applied to indicate exceptions. Noncompliant quality control (QC) is further explained in narrative comments.

- Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD may be performed, unless otherwise specified in the method.
- Surrogate and/or isotope dilution analyte recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in the narrative.

Regulated compliance samples (e.g. SDWA, NPDES) must comply with the associated agency requirements/permits.

Receipt

The samples were received on 3/22/2024 4:10 PM. Unless otherwise noted below, the samples arrived in good condition, and, where required, properly preserved and on ice. The temperatures of the 2 coolers at receipt time were 2.4°C and 2.9°C.

HPLC/IC

Method 9056A_ORGFM_28D: The following samples were diluted due to the nature of the sample matrix: MW01R-GW-0324 (310-277418-1), MW03R-GW-0324 (310-277418-2), MW05R-GW-0324 (310-277418-3), MW19-GW-0324 (310-277418-4) and MW21-GW-0324 (310-277418-5). Elevated reporting limits (RLs) are provided.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Metals

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

General Chemistry

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Qualifiers

General Chemistry

Qualifier	Qualifier Description
HF	Parameter with a holding time of 15 minutes. Test performed by laboratory at client's request. Sample was analyzed outside of hold time.
Rad	

Rad Qualifier

U Result is less than the sample detection limit.

Glossary

Abbreviation These commonly used abbreviations may or may not be present in this report.

□	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	N/A	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

Eurofins Cedar Falls

Job Notes

This report may not be reproduced except in full, and with written approval from the laboratory. The results relate only to the samples tested. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

The test results in this report relate only to the samples as received by the laboratory and will meet all requirements of the methodology, with any exceptions noted. This report shall not be reproduced except in full, without the express written approval of the laboratory. All questions should be directed to the Eurofins Environment Testing North Central, LLC Project Manager.

Job ID: 310-282940-1

Job ID: 310-282940-1

Eurofins Cedar Falls

Job Narrative 310-282940-1

Analytical test results meet all requirements of the associated regulatory program listed on the Accreditation/Certification Summary Page unless otherwise noted under the individual analysis. Data qualifiers are applied to indicate exceptions. Noncompliant quality control (QC) is further explained in narrative comments.

- Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD may be performed, unless otherwise specified in the method.
- Surrogate and/or isotope dilution analyte recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in the narrative.

Regulated compliance samples (e.g. SDWA, NPDES) must comply with the associated agency requirements/permits.

Receipt

The samples were received on 6/6/2024 4:10 PM. Unless otherwise noted below, the samples arrived in good condition, and, where required, properly preserved and on ice. The temperature of the cooler at receipt time was 2.1°C.

Metals

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

General Chemistry

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Qualifiers

General Chemistry

Qualifier	Qualifier Description
HF	Parameter with a holding time of 15 minutes. Test performed by laboratory at client's request. Sample was analyzed outside of hold time.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
□	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Login Sample Receipt Checklist

Client: GHD Services Inc.

Job Number: 310-282940-1

Login Number: 282940

List Source: Eurofins Cedar Falls

List Number: 1

Creator: Bennett, Samantha

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	N/A	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A	

ANALYTICAL REPORT

PREPARED FOR

Eurofins Cedar Falls

Job Notes

This report may not be reproduced except in full, and with written approval from the laboratory. The results relate only to the samples tested. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

The test results in this report relate only to the samples as received by the laboratory and will meet all requirements of the methodology, with any exceptions noted. This report shall not be reproduced except in full, without the express written approval of the laboratory. All questions should be directed to the Eurofins Environment Testing North Central, LLC Project Manager.

Job ID: 310-290219-1

Job ID: 310-290219-1

Eurofins Cedar Falls

Job Narrative 310-290219-1

Analytical test results meet all requirements of the associated regulatory program listed on the Accreditation/Certification Summary Page unless otherwise noted under the individual analysis. Data qualifiers and/or narrative comments are included to explain any exceptions, if applicable.

- Matrix QC may not be reported if insufficient sample is provided or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD may be performed, unless otherwise specified in the method.
- Surrogate and/or isotope dilution analyte recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in the narrative.

Regulated compliance samples (e.g. SDWA, NPDES) must comply with the associated agency requirements/permits.

Receipt

The samples were received on 9/11/2024 9:10 AM. Unless otherwise noted below, the samples arrived in good condition, and, where required, properly preserved and on ice. The temperature of the cooler at receipt time was 0.8°C.

HPLC/IC

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Metals

Method 6020B: The reference method requires samples to be preserved to a pH of <2. The following sample was received with insufficient preservation at a pH of >2: MW231SR-GW-GW-0924 (310-290219-2). The sample(s) was preserved to the appropriate pH in the laboratory.

Method 6020B - Dissolved: The reference method requires samples to be preserved to a pH of <2. The following sample was received with insufficient preservation at a pH of >2: MW223S-GW-0924 (310-290219-1). The sample(s) was preserved to the appropriate pH in the laboratory.

Method 7470A: The reference method requires samples to be preserved to a pH of <2. The following sample was received with insufficient preservation at a pH of >2: MW231SR-GW-GW-0924 (310-290219-2). The sample(s) was preserved to the appropriate pH in the laboratory.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

General Chemistry

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Job ID: 310-290219-1

Qualifiers

General Chemistry

Qualifier	Qualifier Description
HF	Parameter with a holding time of 15 minutes. Test performed by laboratory at client's request. Sample was analyzed outside of hold time.
Rad U	Result is less than the sample detection limit.

Glossary

Abbreviation These commonly used abbreviations may or may not be present in this report.

⊕	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	N/A	
Sample custody seals, if present, are intact.	N/A	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

JOB DESCRIPTION

MEC Neal North Energy Center CCR

JOB NUMBER

310-290339-1

Eurofins Cedar Falls

Job Notes

This report may not be reproduced except in full, and with written approval from the laboratory. The results relate only to the samples tested. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

The test results in this report relate only to the samples as received by the laboratory and will meet all requirements of the methodology, with any exceptions noted. This report shall not be reproduced except in full, without the express written approval of the laboratory. All questions should be directed to the Eurofins Environment Testing North Central, LLC Project Manager.

Case Narrative

Client: GHD Services Inc.

Project: MEC Neal North Energy Center CCR

Job ID: 310-290339-1

Job ID: 310-290339-1

Eurofins Cedar Falls

Job Narrative 310-290339-1

Analytical test results meet all requirements of the associated regulatory program listed on the Accreditation/Certification Summary Page unless otherwise noted under the individual analysis. Data qualifiers and/or narrative comments are included to explain any exceptions, if applicable.

- Matrix QC may not be reported if insufficient sample is provided or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD may be performed, unless otherwise specified in the method.
- Surrogate and/or isotope dilution analyte recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in the narrative.

Regulated compliance samples (e.g. SDWA, NPDES) must comply with the associated agency requirements/permits.

Receipt

The samples were received on 9/12/2024 9:15 AM. Unless otherwise noted below, the samples arrived in good condition, and, where required, properly preserved and on ice. The temperatures of the 2 coolers at receipt time were 4.0°C and 4.5°C.

HPLC/IC

Method 9056A_ORGFM_28D: The following samples were diluted due to the nature of the sample matrix: MW13R-GW-0924 (310-290339-1), MW27-GW-0924 (310-290339-2), MW29R-GW-0924 (310-290339-3) and DP01-GW-0924 (310-290339-4). Elevated reporting limits (RLs) are provided.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Metals

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

General Chemistry

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Eurofins Cedar Falls

Case Narrative

Client: GHD Services Inc.

Project: MEC Neal North Energy Center CCR

Job ID: 310-290339-1

Job ID: 310-290339-2

Eurofins Cedar Falls

Job Narrative 310-290339-2

Analytical test results meet all requirements of the associated regulatory program listed on the Accreditation/Certification Summary Page unless otherwise noted under the individual analysis. Data qualifiers and/or narrative comments are included to explain any exceptions, if applicable.

- Matrix QC may not be reported if insufficient sample is provided or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD may be performed, unless otherwise specified in the method.
- Surrogate and/or isotope dilution analyte recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in the narrative.

Regulated compliance samples (e.g. SDWA, NPDES) must comply with the associated agency requirements/permits.

Receipt

The samples were received on 9/12/2024 9:15 AM. Unless otherwise noted below, the samples arrived in good condition, and, where required, properly preserved and on ice. The temperatures of the 2 coolers at receipt time were 4.0°C and 4.5°C.

Gas Flow Proportional Counter

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Rad

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Qualifiers

Metals

Qualifier	Qualifier Description
4	MS, MSD: The analyte present in the original sample is greater than 4 times the matrix spike concentration; therefore, control limits are not applicable.

General Chemistry

Qualifier	Qualifier Description
HF	Parameter with a holding time of 15 minutes. Test performed by laboratory at client's request. Sample was analyzed outside of hold time.

Rad

Qualifier	Qualifier Description
U	Result is less than the sample detection limit.

Glossary

Abbreviation

These commonly used abbreviations may or may not be present in this report.

%	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	N/A	
Sample custody seals, if present, are intact.	N/A	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

Job Notes

This report may not be reproduced except in full, and with written approval from the laboratory. The results relate only to the samples tested. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

The test results in this report relate only to the samples as received by the laboratory and will meet all requirements of the methodology, with any exceptions noted. This report shall not be reproduced except in full, without the express written approval of the laboratory. All questions should be directed to the Eurofins Environment Testing North Central, LLC Project Manager.

Job Narrative 310-290597-1

Analytical test results meet all requirements of the associated regulatory program listed on the Accreditation/Certification Summary Page unless otherwise noted under the individual analysis. Data qualifiers and/or narrative comments are included to explain any exceptions, if applicable.

- Matrix QC may not be reported if insufficient sample is provided or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD may be performed, unless otherwise specified in the method.
- Surrogate and/or isotope dilution analyte recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in the narrative.

Regulated compliance samples (e.g. SDWA, NPDES) must comply with the associated agency requirements/permits.

Receipt

The samples were received on 9/13/2024 4:26 PM. Unless otherwise noted below, the samples arrived in good condition, and, where required, properly preserved and on ice. The temperatures of the 2 coolers at receipt time were 3.8°C and 5.1°C.

HPLC/IC

Method 9056A_ORGFM_28D: The following samples were diluted due to the nature of the sample matrix: MW01R-GW-0924 (310-290597-1), MW03R-GW-0924 (310-290597-2), MW05R-GW-0924 (310-290597-3), MW19-GW-0924 (310-290597-4), MW21-GW-0924 (310-290597-5) and DP05-GW-0924 (310-290597-6). Elevated reporting limits (RLs) are provided.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Metals

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

General Chemistry

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Qualifiers

General Chemistry

Qualifier	Qualifier Description
HF	Parameter with a holding time of 15 minutes. Test performed by laboratory at client's request. Sample was analyzed outside of hold time.
Rad	

Rad

Qualifier	Qualifier Description
U	Result is less than the sample detection limit.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
☀	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Login Sample Receipt Checklist

Client: GHD Services Inc.

Job Number: 310-290597-1

Login Number: 290597

List Source: Eurofins Cedar Falls

List Number: 1

Creator: Hirsch, Preston

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	N/A	
Sample custody seals, if present, are intact.	N/A	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

Notes:

< 100 - Not detected at the associated reporting limit.

7.0 J - Estimated concentration.

Data distribution was determined by ProUCL using detects only.

Statistic: calculated as the sum of the signs of all possible pair-wise data comparisons.

Probability of significance: A value less than 0.05 indicates greater than 95 percent confidence of a statistically significant trend.

UTLs were calculated using pooled data from Upgradient wells MW-13, MW-27, MW-29, MW-223S, and MW-231S.

Non-parametric UTLs with 36 baseline samples have an actual confidence coefficient of 0.84 (i.e., 84 percent confidence) at 95 percent coverage.

Non-parametric UTLs with 36 baseline samples have an actual confidence coefficient of 0.304 (i.e., 30 percent confidence) at 99 percent coverage.

KM - UTLs were calculated using Kaplan-Meyer estimates for non-detects.

WH - UTLs were calculated using gamma distribution and the Wilson-Hilferty method.

TDS - Total dissolved solids.

Table D.4

Intra-Well Comparison Values
(Upper Tolerance Limits based on Baseline Period Data at each Well)
MidAmerican Energy Company
Neal North Closed CCR Monofill
Sergeant Bluff, Iowa

Notes:

N - number of samples

%ND - percent non-detects

Data distribution was determined by PROUCL using detects only.

Statistic: calculated as the sum of the signs of all possible pair-wise data comparisons.

Probability of significance: A value less than 0.05 indicates greater than 95 percent confidence of a statistically significant trend.

< 100 - Not detected at the associated reporting limit.

7.0 J - Estimated concentration.

When a trend is present during the baseline period, no UTL was calculated. Instead, the baseline range is listed for comparison.

Non-parametric UTLs with 6 baseline samples have an actual confidence coefficient of 0.27 (i.e., 27 percent confidence) and
8 baseline samples have an actual confidence coefficient of 0.34 (i.e., 34 percent confidence), at 95 percent coverage.

Non-parametric UTLs with 6 baseline samples have an actual confidence coefficient of 0.059 (i.e., 5.9 percent confidence) and
8 baseline samples have an actual confidence coefficient of 0.077 (i.e., 7.7 percent confidence), at 99 percent coverage.

KM - UTLs were calculated using Kaplan-Meyer estimates for non-detects.

WH - UTLs were calculated using gamma distribution and the Wilson-Hilferty method.

TDS - Total dissolved solids

Notes:

0.395 / 0.375 - Field duplicate results.

U - Not detected at the associated reporting limit.

62.5 / 64.5 Value exceeds inter-well baseline 95/95 UTL or is outside of baseline range.

0.619 Value exceeds inter-well baseline 99/95 UTL.

† - Trend present during baseline period, no UTL values calculated (baseline range listed for comparison).

Pooled Background consists of MW-13, MW-27, MW-29, MW-223S, and MW-231S.

None - No MCL established.

^a Maximum contaminant level (MCL).^b Groundwater protection standard (GWPS) established under 40 CFR 257.95(h)(2).

Notes:

0.100 / 0.106 - Field duplicate results.

< 0.500 - Not detected at the associated reporting limit.

J - Estimated concentration.

0.888 Value exceeds intra-well baseline 95/95 UTL or is outside of baseline range (for baseline data sets with temporal trends).

None - No MCL established.

^a Maximum contaminant level (MCL).^b Groundwater protection standard (GWPS) established under 40 CFR 257.95(h)(2).

8.2 J Value exceeds intra-well baseline 99/95 UTL.

† - Trend present during baseline period, no UTL values calculated (baseline range listed for comparison).
