Certification page (PE or ground water scientist signature) ***113.10(1)"d"***

For the purposes of this rule, a "qualified groundwater scientist" means a scientist or an engineer who has received a baccalaureate or postgraduate degree in the natural sciences or engineering and has sufficient training and experience in groundwater hydrology and related fields demonstrated by state registration, professional certifications, or completion of accredited university programs that enable that individual to make sound professional judgments regarding groundwater monitoring, contaminant fate and transport, and corrective action.

Acronyms/Abbreviations

ACM = Assessment of Corrective Measures
AWQR = Annual Water Quality Report
C&D = Construction and Demolition
CAMP = Corrective Action Monitoring Program
CCR = Coal Combustion Residue
DO = Dissolved Oxygen
GWPS = Groundwater Protection Standard
HDR = HDR Engineering, Inc.
HMSP = Hydrologic Monitoring System Plan
IAC = Iowa Administrative Code
IDNR = Iowa Department of Natural Resources
LCL = Lower Confidence Limit
LCS = Laboratory Control Sample
LCSD = Laboratory Control Sample Duplicate
LCSPER = Leachate Control System Evaluation Report
MPE = Metro Park East
MWA = Metro Waste Authority
MDL = Method Detection Limit
MSW = Municipal Solid Waste
MSWLF = Municipal Solid Waste Landfill
ORP = Oxidation Reduction Potential
QA/QC = Quality Assurance / Quality Control
RL = Reporting Limit
RPD = Relative Percent Difference
SSI = Statistically Significant Increase above background
SSL = Statistically Significant Level above groundwater protection standard
TSS = Total Suspended Solids
UPL = Upper Prediction Limit

Executive Summary

This 2024 Annual Water Quality Report (AWQR) summarizes groundwater monitoring activities, associated data, and statistical analyses that were performed by HDR Engineering, Inc. (HDR) on behalf of the Metro Waste Authority's (MWA) Metro Park East (MPE) Phase I municipal solid waste landfill (MSWLF) unit; herein referenced as the Site. These activities were conducted in accordance with Iowa Administrative Code (IAC) 567—113.10, the current approved Hydrologic Monitoring System Plan (HMSP), the current approved Corrective Action Groundwater Monitoring Program and Groundwater Monitoring Optimization Report, and additional Iowa Department of Natural Resources (IDNR) requirements specified in the Site's solid waste disposal permit number 77-SDP-01-72P.

Groundwater elevations, groundwater purge parameters, and water quality samples were collected as part of the annual sampling event conducted in October 2024. Groundwater samples were submitted to Eurofins in Cedar Falls, Iowa for analysis. Statistical analyses performed included upper prediction limits (UPLs) to identify statistically significant increases (SSIs), and lower confidence limit (LCL) analysis to identify concentrations measured at statistically significant levels (SSLs) above the groundwater protection standards (GWPS). The statistical comparisons were completed using Sanitas® v10.0.15 (Sanitas Technologies) software.

Monitoring Network

Monitoring locations analyzed during the 2024 annual sampling event included two upgradient monitoring locations (MW-23 and MW-24R); six assessment monitoring wells (MW-18, MW-19, MW-28, MW-39, MW-55, and MW-56); five assessment/corrective action monitoring program (CAMP) monitoring wells (MW-14R, MW-31R, MW-32R, MW-33R, and MW-58); six CAMP monitoring points (MW-62, MW-68, MW-69, MW-70, MW-73, and PZ-13); three corrective action/CAMP monitoring wells (MW-29, MW-30R, and MW-57R); a bracketing well (MW-60), a groundwater underdrain treated as leachate (GU-3A), and five voluntary surface water monitoring points (SW-101, SW-102, SW-103, SW-106, and SW-107). Two voluntary surface water monitoring points (SW-104 and SW-105) were not sampled due to no surface water present at the monitoring locations during the October 2024 monitoring event. The Site also has six abandoned monitoring wells which are no longer sampled (MW-20, MW-21, MW-22R, MW-57, MW-59, and MW-72). Per IDNR's comment letter dated May 31, 2024, monitoring wells MW-50, MW-51, MW-52, MW-53, and MW-54 were converted to water level gauging only monitoring points and are no longer sampled as part of the HMSP for the site. The monitoring network for the Site is summarized in the attached **Table 1**, along with the monitoring program of each monitoring point and sampling performed during this reporting period.

Statistical Analysis

Based on the 2024 annual sampling event statistical analysis, SSLs were detected for the following well-constituent pairs:

- MW-29: Cobalt, Vinyl Chloride
- MW-30R: Arsenic, Vinyl Chloride
- MW-57R: Cobalt
- MW-58: Arsenic

Each SSL detected during the 2024 annual sampling event has been detected during previous statistical analyses. Monitoring well MW-57R was installed in May 2020 and is a replacement well for MW-57. The October 2024 monitoring event was the first compliance event following development of the background database for monitoring well MW-57R. Cobalt was historically detected at a SSL in groundwater samples collected from monitoring well MW-57.

Trends were evaluated for the eight most recent sampling events at the 98% confidence level. The following significant trends were identified during the statistical analysis:

- Decreasing Trends
  - Barium at MW-29
  - Cadmium at MW-73
  - Cobalt at MW-58
  - cis-1,2-Dichloroethene at MW-69
  - Lead at MW-73
  - Nickel at MW-29
  - trans-1,2-Dichloroethene at MW-29
  - Trichloroethene at MW-29
  - Vanadium at MW-73
- Increasing Trends
  - 1,1-Dichloroethane at MW-14R
  - cis-1,2-Dichloroethene at MW-14R
  - Vinyl chloride at MW-57R

Conclusions and Recommendations

No new SSLs were detected during the 2024 annual sampling event. No groundwater resampling is necessary for monitoring locations evaluated during the reporting period.

The following actions are recommended for the continuation of annual groundwater sampling for the Phase I site:

1. Continue collecting water level measurements on an annual basis at each HMSP approved monitoring location.
2. Collect well depth measurements once every 5-years. Well depths were collected during the 2022 sampling event and will be collected again in 2027.
3. Discharge from seep tie-in trench discharge point GU-3A will continue to be treated as leachate.
4. Continue following the requirements of IAC 567-113.10(9) as they relate to corrective action.

5. Continue with annual leachate sample collection and analysis. The Leachate Control System Evaluation Report (LCSPER) for the Metro Park East Landfill will be submitted with the MPE Phase II AWQR.

1 Purpose

This 2024 Annual Water Quality Report (AWQR) summarizes groundwater monitoring activities, associated data, and statistical analyses that were prepared by HDR Engineering, Inc. (HDR) on behalf of the Metro Waste Authority's (MWA) Metro Park East (MPE) Phase I municipal solid waste landfill (MSWLF) unit, herein referenced as the Site. These activities were conducted in accordance with Iowa Administrative Code (IAC) 567—113.10, the current approved Hydrologic Monitoring System Plan (HMSP), the current approved Corrective Action Groundwater Monitoring Program and Groundwater Monitoring Optimization Report, and additional Iowa Department of Natural Resources (IDNR) requirements specified in the Site's solid waste disposal permit number 77-SDP-01-72P.

The MPE landfill permit covers both the Phase I and Phase II MSWLF units. This report addresses groundwater conditions at the closed Phase I MSWLF unit.

2 Site Background

The Site is located approximately ten miles east of Des Moines, Iowa and five miles south of Mitchellville, Iowa at 12181 University Ave NE, Mitchellville, Iowa 50169. The property is bounded on the north by State Highway 163, to the south by SE 6th Avenue and SE 3rd Avenue, to the east by SE 128th Street, and to the west by State Highway 316. Land use in the surrounding area is primarily agricultural. A site map depicting the characteristics of the landfill and surrounding vicinity is provided as **Figure 1**.

The geological interpretation referenced herein was obtained from the HMSP dated October 2011. The Quaternary deposits beneath the MPE Landfill consist of loess, glacial drift, and alluvium. In general, loess soils are present in higher elevation areas while alluvial soils are present in lowland areas and adjoining ravines. Glacial drift soils are exposed on the side slopes between the loess mantle that remains and the deposited alluvium. The site is characterized by shallow groundwater within surficial aquifers. Groundwater flow in the vicinity of the MPE Landfill is to the west/southwest, with localized variation and influence from smaller ravines. Groundwater flow along the northern portion of the east side of the Phase I MSWLF unit flows slightly east due to the influence of a ravine north of the Phase II MSWLF unit, which slopes to the east. The Phase II HMSP notes that the Phase II MSWLF unit is expected to influence groundwater in the vicinity (including in the Phase I unit) and direct it inward toward the groundwater control system.

2.1 Site Status and Applicable Rules

The Phase I MSWLF unit provided disposal to Polk County; the cities of Carlisle, Hartford, and Norwalk in Warren County; the cities of Mingo and Prairie City in Jasper County; and the city of Waukee and unincorporated area in Dallas County. The Phase I MSWLF unit is no longer accepting waste. Wastes previously accepted included municipal solid waste (MSW), non-hazardous construction and demolition (C&D) wastes, coal combustion residue (CCR), and approved special wastes. Other wastes may have been accepted in compliance with IAC 567—

109, Special Waste Authorizations. The Phase I unit ceased accepting waste in September 2007 and closure was completed in 2009.

The Site operates under solid waste disposal permit number 77-SDP-01-72P and subsequent amendments. The applicable regulatory requirements are established in the most recent revision to IAC, Chapter 113.

3 Monitoring Network and Sampling Procedures

3.1 Monitoring Network

Monitoring locations analyzed during the 2024 annual sampling event included two upgradient monitoring locations (MW-23 and MW-24R); six assessment monitoring wells (MW-18, MW-19, MW-28, MW-39, MW-55, and MW-56); five assessment/corrective action monitoring program (CAMP) monitoring wells (MW-14R, MW-31R, MW-32R, MW-33R, and MW-58); six CAMP monitoring points (MW-62, MW-68, MW-69, MW-70, MW-73, and PZ-13); three corrective action/CAMP monitoring wells (MW-29, MW-30R, and MW-57R); a bracketing well (MW-60), a groundwater underdrain treated as leachate (GU-3A), and five voluntary surface water monitoring points (SW-101, SW-102, SW-103, SW-106, and SW-107). Two voluntary surface water monitoring points (SW-104 and SW-105) were not sampled due to no surface water present at the monitoring location during the October 2024 monitoring event. The Site also has six abandoned monitoring wells which are no longer sampled (MW-20, MW-21, MW-22R, MW-57, MW-59, and MW-72). Per IDNR's comment letter dated May 31, 2024, monitoring wells MW-50, MW-51, MW-52, MW-53, and MW-54 were converted to water level gauging only monitoring points and are no longer sampled as part of the HMSP for the site. The monitoring network for the Site is summarized in the attached **Table 1**, along with the monitoring program of each monitoring point and sampling performed during this reporting period. **Table 2** provides the monitoring program implementation plan and sampling schedule. **Table 3** summarizes the monitoring well maintenance and performance reevaluation schedule.

Network wells at the site are sampled annually, in accordance with the Site's HMSP and Provision XI.5 of the Site's solid waste permit. Provision XI.5.f requires that "monitoring wells in detection and assessment monitoring shall be sampled annually using a schedule that captures all four seasons of the year every four years." The monitoring wells at MPE Phase I are sampled across seasons in a rotating quarterly schedule:

Reporting Year	Quarter 1 (Winter – Jan-Mar)	Quarter 2 (Spring – Apr-June)	Quarter 3 (Summer – July-Sept)	Quarter 4 (Fall – Oct-Dec)
2024				X
2025	X			
2026		X		
2027			X	

Each well in the monitoring network is sampled annually, except for MW-57R and MW-73. MW-57R and MW-73 were installed on May 12, 2020, and were sampled semiannually until eight samples were collected. Beginning with the October 2024 sampling event, MW-57R and

MW-73 are sampled on an annual basis. During 2024, monitoring wells MW-57R and MW-73 were sampled in July and October. The 2024 laboratory reports are provided in **Appendix B**.

In accordance with the Solid Waste Disposal Permit Special Provision XI.5.g, resampling for the full set of Appendix II constituents will be completed once every 5 years after assessment monitoring wells have had at least two rounds of analysis using the entire Appendix II list. If monitoring points exit assessment monitoring and later return to assessment monitoring, two rounds of analysis using the entire Appendix II list is required.

The schedule for full Appendix II sampling is shown in the table below:

Monitoring Well	Previously Sampled	Next Sampling Event
MW-14R	2024	2029
MW-18	2024	2029
MW-19	2024	2029
MW-28	2024	2029
MW-29	2024	2029
MW-30R	2024	2029
MW-31R	2024	2029
MW-32R	2024	2029
MW-33R	2024	2029
MW-39	2024	2029
MW-55	2020	2025
MW-56	2024	2029
MW-57R	NA	2025
MW-58	2024	2029

Notes:
NA – Not Applicable.

3.2 Sampling Procedures

A water level indicator was used to measure the static water level in each of the monitoring wells prior to purging and sampling. Groundwater elevations were calculated from static water level measurements and are summarized on the attached **Table 4**. Calculated groundwater elevations for HMSP monitoring wells are shown in the attached **Figure 2** (October 2024 Groundwater Contours). Monitoring wells from both the Phase I (closed landfill) network, Phase II (active landfill) network, and water level only wells are used to create the contours. During the October 2024 sampling event, groundwater elevations in the Phase I HMSP monitoring network ranged from 809.22 (PZ-13) to 915.04 (MW-50) feet above sea level (ASL). The Phase II HMSP notes that the Phase II MSWLF unit is expected to influence groundwater in the vicinity (including in the Phase I unit) and direct it inward toward the groundwater control system. The contour lines in **Figure 2** are consistent with historical groundwater flow.

Dedicated pumps are used to collect groundwater samples from the network wells with the exception of monitoring well MW-14R. Due to field equipment issues, the dedicated pump system was not used at monitoring well MW-14R. Groundwater samples were collected via a peristaltic pump and tubing from monitoring well MW-14R during the October 2024 sampling event. Field parameters were measured to verify and document the presence of a stable and

representative sample medium prior to collection. A multi-parameter meter (YSI Pro DSS with flow cell) was used to take geochemical measurements including temperature, conductivity, oxidation-reduction potential (ORP), dissolved oxygen (DO), turbidity, and pH of the groundwater purged from the monitoring wells and prior to sampling. Geochemical measurements during purging were recorded on the field sampling forms and are provided in **Appendix A**. Groundwater samples were collected following stabilization of purge parameters. Samples were collected in accordance with the standard low flow sampling techniques described in the most recent and approved HMSP.

Surface water monitoring locations SW-101, SW-102, SW-103, SW-104, SW-105, SW-106, and SW-107 are proposed locations for grab sample collection. The grab samples are collected from the discharge via a clean laboratory sample container. Purge parameters are not collected. During the 2024 annual monitoring event, surface water samples were collected from monitoring locations SW-101, SW-102, SW-103, SW-106, and SW-107. Monitoring locations SW-104 and SW-105 were dry during the October 2024 monitoring event.

Current well condition, including casing degradation, collision, or vandalism, is provided on the sampling forms included in **Appendix A**. No well maintenance items were noted during the July 2024 and October 2024 sampling events.

4 Data Evaluation and Summary

Groundwater samples were obtained from network monitoring wells listed in **Table 1**. Groundwater samples were submitted to Eurofins in Cedar Falls, Iowa, for analysis. Historical groundwater analytical results are summarized on the attached **Table 9**.

4.1 Quality Assurance/Quality Control

The quality assurance/quality control (QA/QC) protocols for each sampling event include sampling orders, proper field protocols, and laboratory protocols. Three duplicate samples and four trip blank samples were collected and analyzed during the October 2024 sampling event.

Eurofins is responsible for providing QA/QC of laboratory protocols; this documentation is included in **Appendix B**. The laboratory QA/QC protocols and documentation were reviewed. The laboratory sample receipt checklist indicated all samples were received and analyzed within holding times (with the exception of nitrate as nitrogen at SW-107 and monitored herbicides at monitoring well MW-29), within acceptable temperatures, and sample containers were not broken or leaking.

The following qualifiers were noted for some parameters in the analytical reports for the annual compliance monitoring event:

- *1 : Laboratory control samples (LCS) / laboratory control sample duplicate (LCSD) relative percent difference (RPD) exceeds control limits.
    - Qualifier for herbicide compounds (2,4,5-T and 2,4-D). Each groundwater sample monitored for herbicides had concentrations below laboratory reporting limits during the October 2024 sampling event.

    - Qualifier for 4-Nitroaniline in groundwater samples MW-32R and MW-33R. Concentrations were reported as being below laboratory reporting limits.
- B : Compound was found in the blank and sample.
    - Copper was detected in a laboratory method blank, but was J-qualified. Copper was also detected above laboratory reporting limits in the groundwater sample collected from monitoring well MW-31R.
- H : Sample was prepped or analyzed beyond the specified holding time.
    - The surface water sample SW-107 was past holding time for analysis of Nitrate as nitrogen.
    - The groundwater sample for monitoring well MW-29 was past holding time for herbicides analysis which includes Silvex (2,4,5-TP), 2,4,5-T, and 2,4-D.
- *+ : LCS and/or LCSD is outside acceptable limits, high biased.
    - Carbon disulfide and 1,1-dichloroethene were flagged in select samples. Each concentration was reported as being below laboratory reporting limits.
- *- : LCS and/or LCSD is outside acceptable limits, low biased.
    - 3-Nitroaniline, 4-Chloroaniline, and 4-Nitroaniline were flagged in groundwater samples MW-32R and MW-33R. Each concentration was reported as being below laboratory reporting limits.
- J : Result is less than the laboratory reporting limit (RL) but greater than or equal to the laboratory method detection limit (MDL) and the concentration is an approximate value. Detections with J-flags are not considered as statistically significant results during analysis.

None of the well-constituent pairs with qualifiers were flagged as outliers during the outlier analysis, which indicates the results are consistent with historical data. The review of laboratory data did not trigger corrective measures such as laboratory re-analysis for the 2024 sampling event.

No constituents were detected in the trip blanks, except for a J-flagged detections of acetone. J-flagged detections are not considered significant, and therefore the results of the trip blank did not trigger corrective measures such as resampling or laboratory re-analysis. Acetone is also a common laboratory contaminant.

Three field duplicate samples (DUP-1, DUP-2, and DUP-3) were collected during the October 2024 sampling event. Field duplicate samples were analyzed to determine the relative percent difference (RPD) between the original (parent) sample and the duplicate sample. RPD values are only calculated for constituents detected above the laboratory MDL for both the parent and duplicate sample. According to *Practical Guide for Ground-Water Sampling*, Barcelona et al, November 1985, “Duplicate sample values which differ by less than ±50% relative difference indicates good error control.”

The table below presents the parent/duplicate sample results along with the calculated RPD values. Each calculated RPD value is below the recommended 50% in duplicate pairs DUP-1/MW-39, DUP-2/MW-19, and DUP-3/MW-32R.

Parameter	Units	DUP-1	MW-39	RPD (%)	DUP-2	MW-19	RPD (%)	DUP-3	MW-32R	RPD (%)
Arsenic	mg/L	0.00102J	0.00175J	52.71	-	-	-	-	-	-
Barium	mg/L	0.127	0.143	11.85	0.0668	0.0767	13.80	0.285	0.283	0.70
Cadmium	mg/L	0.000253	0.000235	7.38	-	-	-	-	-	-
Cobalt	mg/L	0.0168	0.0255	41.13	-	-	-	0.000212J	0.000198J	6.83
Lead	mg/L	-	-	-	-	-	-	0.000294J	0.000273J	7.41
Nickel	mg/L	0.0152	0.0147	3.34	-	-	-	-	-	-
TSS	mg/L	2.25	2.50	10.53	4.50	1.63J	93.64	23.8	30.3	24.03

Notes:
RPD = Relative Percent Difference
TSS = Total Suspended Solids
mg/L = milligrams per liter
'-' = Not Applicable; Constituent was not detected and/or RPD was not calculated.

The relatively high RPD value for arsenic for the MW-39/DUP-1 duplicate pair and TSS for the MW-19/DUP-2 duplicate pair could be the result of concentrations being close to the laboratory's reporting limit. As measured concentrations approach the reporting limit, uncertainty associated with the RPD calculation increases. A general industry standard for evaluating precision of low concentration detections is comparing the absolute difference between the sample and duplicate value to two times the laboratory reporting limit. The absolute difference summary for arsenic for the MW-39/DUP-1 duplicate pair and TSS for the MW-19/DUP-2 duplicate pair are summarized on the table below. Arsenic for the MW-39/DUP-1 duplicate pair and TSS for the MW-19/DUP-2 duplicate pair each fall within acceptance criteria due to the low concentrations relative to the reporting limit.

Duplicate Pair	Constituent	Units	Duplicate Concentration	Parent Sample Concentration	Absolute Difference	RL	2*RL	Absolute Difference < 2*RL (Yes or No)
MW-39/DUP-1	Arsenic	mg/L	0.00102J	0.00175J	0.00073	0.002	0.004	Yes
MW-19/DUP-2	TSS	mg/L	1.63J	4.50	2.87	1.88	3.76	Yes

Notes:
RL = Reporting Limit
Absolute Difference = | Duplicate Concentration – Sample Concentration |
mg/L = milligrams per liter

Results of the quality assurance/quality control samples have been qualified and did not trigger corrective measures such as resampling or laboratory re-analysis for the 2024 annual sampling event.

4.2 Statistical Analysis

Prior to statistical analyses, descriptive analyses are performed on the dataset consisting of outlier analysis, time series graphs, box and whisker plots, and trend test analysis. These tests are performed to verify the validity of the data used to determine upper prediction limits (UPLs) and lower confidence limits (LCLs). Statistical analyses performed included prediction limits to identify statistically significant increases (SSIs), and LCL analysis to identify concentrations

measured at statistically significant levels (SSLs) above the groundwater protection standards (GWPS). The statistical comparisons were completed using Sanitas® v10.0.15 (Sanitas Technologies) software. Results of statistical analyses are located in **Appendix C**.

Due to high cobalt concentrations sitewide, a site-specific standard of 0.0137 mg/L has been established and is used to calculate LCLs. The other constituents use the GWPS listed in **Table 7** and **Table 8**. A summary of October 2024 and historical SSIs and SSLs is included in **Table 10**.

4.2.1 Prediction Limits

Interwell UPLs for inorganic constituents were calculated with all historical data through 2024 from background wells MW-23 and MW-24R. The UPLs used a non-parametric test (as opposed to a parametric UPL) as the data was non-normal for each constituent except for nickel. For non-parametric interwell UPLs, the UPL is the highest background value from the historical data set. For nickel, a parametric UPL was calculated. Historical UPLs, calculated annually between 2018 and 2024, are shown graphically in the Standards History in **Appendix D**.

Assessment monitoring well-constituent pairs for the October 2024 sampling event were evaluated for trends and confidence intervals. UPLs were not calculated for organic constituents.

4.2.2 Double Quantification Rule

For organic constituents, the quasi-statistical double quantification rule (DQR) analysis was used to identify SSIs. SSIs were identified if an organic constituent was detected above laboratory reporting limits in both the 2023 annual monitoring results and 2024 annual monitoring results.

4.2.3 Trends

Trend tests were calculated for both inorganic and organic constituents at the 98% confidence level. For organic constituents, trend tests were constructed if there were enough historical detections for the Sanitas statistical program to run the Sen's Slope / Mann-Kendall trend test (n = 4). Short-term (eight most recent sampling events) and long-term (16 most recent sampling events) trends were constructed to evaluate the data over time. For some constituents, less than eight detections were used to construct the trend tests due to historical variations in testing frequency by constituent. The following statistically significant trends were identified in the short-term trend dataset during the analysis:

- Decreasing Trends
    - Barium at MW-29
    - Cadmium at MW-73
    - Cobalt at MW-58
    - cis-1,2-Dichloroethene at MW-69
    - Lead at MW-73
    - Nickel at MW-29

  - trans-1,2-Dichloroethene at MW-29
  - Trichloroethene at MW-29
  - Vanadium at MW-73

- Increasing Trends
  - 1,1-Dichloroethane at MW-14R
  - cis-1,2-Dichloroethene at MW-14R
  - Vinyl chloride at MW-57R

4.2.3 Confidence Intervals

Confidence intervals indicated SSLs over GWPS for monitoring wells MW-29, MW-30R, MW-57R, and MW-58. SSLs were detected for the following well-constituent pairs:

- MW-29: Cobalt, Vinyl Chloride
- MW-30R: Arsenic, Vinyl Chloride
- MW-57R: Cobalt
- MW-58: Arsenic

The SSLs detected during the October 2024 sampling event have been detected during previous statistical analyses with the exception of cobalt at monitoring well MW-57R. Monitoring well MW-57R was installed in May 2020 and is a replacement well for MW-57. The October 2024 monitoring event was the first compliance event following development of the background database for monitoring well MW-57R. Cobalt was historically detected at a SSL in groundwater samples collected from monitoring well MW-57. Since MW-57R is monitoring the same general area as former monitoring well MW-57, no new SSLs were identified during the 2024 statistical analysis.

Table 11 summarizes the trends for the recent eight samples for constituent-well pairs that have been identified as SSLs during the 2024 annual reporting period. A statistically significant trend was not identified for the constituents identified as SSLs during the 2024 annual reporting period.

5 Corrective Action Monitoring

The Site has prepared an Assessment of Corrective Measures (ACM) and selected a remedy for corrective action. The following steps have been taken for the ACM process:

- An ACM report was submitted to IDNR on July 8, 2011 (Doc # 65728) and approved as Permit Amendment #12, issued by IDNR on January 15, 2013 (Doc #75705).
- A public meeting to discuss the findings of the ACM report was held on March 11, 2013. Notes of the meeting were placed in the operating record and submitted to IDNR on April 23, 2013 (Doc #76700).
- MWA submitted the Selection of Remedy on May 20, 2013 (Doc #77010). The selected remedy was implemented upon approval.
- The IDNR approved the Selection of Remedy in correspondence dated June 13, 2013 (Doc #77271).

- Corrective action financial assurance documentation was submitted on June 14, 2013 (Doc #77401).
- The CAMP, dated July 2014 (Doc #80628), was approved by the IDNR in Permit Amendment #26 dated January 26, 2015 (Doc #82285) and implemented in June 2015.
- The sampling and evaluation procedure in the CAMP were modified and approved in IDNR in the revised site permit dated July 26, 2016 (Doc #86768).

The Corrective Action Monitoring Plan Report for 2024 is included in **Appendix E**.

6 Conclusions and Recommendations

No new SSLs were detected during the October 2024 annual sampling event. No groundwater resampling is necessary for monitoring locations evaluated during the reporting period.

The following actions are recommended for the continuation of annual groundwater sampling for the Phase I site:

1. Continue collecting water level measurements on an annual basis at each HMSP approved monitoring location.
2. Collect well depth measurements once every 5-years. Well depths were collected during the 2022 sampling event and will be collected again in 2027.
3. Discharge from seep tie-in trench discharge point GU-3A will continue to be treated as leachate.
4. Continue following the requirements of IAC 567-113.10(9) as they relate to corrective action.
5. Continue with annual leachate sample collection and analysis. The Leachate Control System Evaluation Report (LCSPER) for the Metro Park East Landfill will be submitted with the MPE Phase II AWQR.

Notes:
[1] Based on Table 1-1 from the 2015 AWQR - Phase I MSWLF Unit dated January 27, 2016 by Barker Lemar Engineering Consultants. Data from 2016 to present added to existing Table 1 data.
[2] Indicates samples collected for Appendix I parameters.
[3]Per IDNR's comment letter dated May 31, 2024, monitoring wells MW-50, MW-51, MW-52, MW-53, and MW-54 were converted to water level gauging only monitoring points and are no longer sampled.
[4] Constituent was identified as a potential SSI. Since this was the initial detection, a verification monitoring event will be conducted during the next annual monitoring event to confirm the SSI.
DCA = Dichloroethane
DCE = Dichloroethene
SSI = Statistically Significant Increase
SSL - Statistically Significant Level
TCE = Trichloroethene
WLGO = Water Level Gauging Only

SW-107	Not Sampled	TSS, Ammonia, Chloride, COD, Iron (dissolved), Arsenic, Cobalt, Nitrate as N	TSS, Ammonia, Chloride, COD, Iron (dissolved), Arsenic, Cobalt, Nitrate as N

Comments:

[1] All wells in the Phase I monitoring network are sampled annually, except for MW-57R and MW-73, which were sampled semiannually. In previous years, the wells were split into Group 1 and Group 2 and rotated throughout the year to account for seasonality. IDNR approved an updated schedule where all wells are sampled annually across seasons in a rotating quarterly schedule (see **Section 3.1**).

[2] MW-57R and MW-73 were installed in May 2020 and were sampled semiannually until eight samples were collected, at which point the wells would transition to being sampled annually. Annual sampling began in October 2024 for these monitoring wells.

[3] Per IDNR's comment letter dated May 31, 2024, monitoring wells MW-50, MW-51, MW-52, MW-53, and MW-54 were converted to water level gauging only monitoring points and are no longer sampled.

Comments:

[(1)] Background standard for inorganic constituents is the calculated Upper Prediction Limit (UPL), if established. For inorganic constituents not previously detected at the monitoring well or are not actively monitored in the background monitoring wells (i.e., Appendix II constituents), the background standard is the laboratory reporting limit for the constituent. For organic constituents, the background standard is the laboratory reporting limit for the constituent.

[(2)] Metro Park East has a site-specific groundwater protection standard (GWPS) of 0.0137 mg/L for cobalt.

[(3)] Constituent was identified as a potential statistically significant increase (SSI). Since this is the initial detection, a verification monitoring event will be conducted during the next annual monitoring event to confirm the SSI.

[(4)] The GWPS for sulfide is the UPL since an Iowa Statewide Standard value is not established.

Notes:

DCA = Dichloroethane
DCE = Dichloroethene
TCE = Trichloroethene
mg/L = milligrams per liter
µg/L = micrograms per liter
RL = Reporting Limit
