Note Since laboratory accreditations are subject to change Eurofins Environment Testing North Central LLC places the ownership of method analyte & accreditation compliance upon our subcontract laboratories This sample shipment is forwarded under chain-of-custody If the laboratory does not currently maintain accreditation in the State of Origin listed above for analysis/tests/matrix being analyzed the samples must be shipped back to the Eurofins Environment Testing North Central LLC laboratory or other instructions will be provided. Any changes to accreditation status should be brought to Eurofins Environment Testing North Central, LLC attention immediately If all requested accreditations are current to date return the signed Chain of Custody attesting to said compliance to Eurofins Environment Testing North Central LLC

Possible Hazard Identification	Sample Disposal (A fee may be assessed if samples are retained longer than 1 month)
Unconfirmed	☐ Return To Client ☐ Disposal By Lab ☐ Archive For _____ Months

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	N/A	
Sample custody seals, if present, are intact.	N/A	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

Job Notes

This report may not be reproduced except in full, and with written approval from the laboratory. The results relate only to the samples tested. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

The test results in this report relate only to the samples as received by the laboratory and will meet all requirements of the methodology, with any exceptions noted. This report shall not be reproduced except in full, without the express written approval of the laboratory. All questions should be directed to the Eurofins Environment Testing North Central, LLC Project Manager.

Job Narrative
310-314023-1

The analytical test results presented in this report meet all requirements of the associated regulatory program listed on the Accreditation/Certification Summary Page, unless otherwise noted. Data qualifiers and/or narrative comments are included to explain any exceptions, if applicable. Regulated compliance samples (e.g. SDWA, NPDES) must comply with associated agency requirements/permits.

- Matrix-specific batch QC (e.g., MS, MSD, SD) may not be reported when insufficient sample volume is available or when site-specific QC samples are not submitted. In such cases, a Laboratory Control Sample Duplicate (LCSD) may be analyzed to provide precision data for the batch.
- For samples analyzed using surrogate and/or isotope dilution analytes, any recoveries falling outside of established acceptance criteria are re-prepared and/or re-analyzed to confirm results, unless the deviation is due to sample dilution or otherwise explained in the case narrative.

Receipt
The samples were received on 8/22/2025 1:30 PM. Unless otherwise noted below, the samples arrived in good condition, and, where required, properly preserved and on ice. The temperatures of the 6 coolers at receipt time were 0.3°C, 0.8°C, 1.1°C, 1.4°C, 1.4°C and 1.8°C.

GC/MS VOA
No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

GC/MS Semi VOA
Method 8270E: The laboratory control sample and the laboratory control sample duplicate (LCS/LCSD) for preparation batch 310-464848 and analytical batch 310-465678 recovered outside control limits for the following analyte(s): 1,4-phenylenediamine. 1,4-phenylenediamine have been identified as a poor performing analyte when analyzed using this method; therefore, re-extraction/re-analysis was not performed.

Method 8270E: The laboratory control sample (LCS) for preparation batch 310-464848 and analytical batch 310-465678 recovered outside control limits for the following analytes: Famphur and Kepone. These analytes were biased high in the LCS and were not detected in the associated samples; therefore, the data have been reported.

Method 8270E: The laboratory control sample duplicate (LCSD) for preparation batch 310-464848 and analytical batch 310-465678 recovered outside control limits for the following analyte(s): Methapyrilene. Methapyrilene has been identified as a poor performing analyte when analyzed using this method; therefore, re-extraction/re-analysis was not performed.

Method 8270E: The laboratory control sample duplicate (LCSD) for preparation batch 310-464848 and analytical batch 310-465678 recovered outside control limits for the following analytes: Famphur. These analytes were biased high in the LCSD and were not detected in the associated samples; therefore, the data have been reported.

Method 8270E: The RPD of the laboratory control sample (LCS) and laboratory control sample duplicate (LCSD) for preparation batch 310-464848 and analytical batch 310-465678 recovered outside control limits for the following analytes: 1-Naphthylamine, 3,3'-Dimethylbenzidine and Methapyrilene.

Method 8270E: The laboratory control sample and/or the laboratory control sample duplicate (LCS/LCSD) for preparation batch 310-464719 and analytical batch 310-465678 recovered outside control limits for the following analyte(s): 1,4-phenylenediamine. 1,4-phenylenediamine have been identified as a poor performing analyte when analyzed using this method; therefore, re-extraction/re-analysis was not performed.

Method 8270E: The laboratory control sample (LCS) for preparation batch 310-464719 and analytical batch 310-465678 recovered outside control limits for the following analytes: Diallate, Diallate Peak 1, Famphur and Kepone. These analytes were biased high in the LCS and were not detected in the associated samples; therefore, the data have been reported.

Method 8270E: The laboratory control sample duplicate (LCSD) for preparation batch 310-464719 and analytical batch 310-465678 recovered outside control limits for the following analytes: Famphur. These analytes were biased high in the LCSD and were not detected in the associated samples; therefore, the data have been reported.

Method 8270E: The RPD of the laboratory control sample (LCS) and laboratory control sample duplicate (LCSD) for preparation

batch 310-464719 and analytical batch 310-465678 recovered outside control limits for the following analytes: 1,4-phenylenediamine and Kepone.

Method 8270E: The surrogate recovery for the blank associated with preparation batch 310-464719 and 310-464848 and analytical batch 310-465678 was outside the upper control limits.

Method 8270E: The initial calibration verification (ICV) result for batch 310-465678 was above the upper control limit. The affected analytes are: 1,4-phenylenediamine. Sample results were non-detects, and have been reported as qualified data.

Method 8270E: The continuing calibration verification (CCV) associated with batch 310-465678 recovered above the upper control limit for Dibenzo(a,h)anthracene(35.1%D). The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported. The associated sample is:(CCV 310-465678/14).

Method 8270E: Internal standard (ISTD) response for the following sample was outside of acceptance limits: MW-11_25_08 (310-314023-3). The ISTD failed low causing the data to be biased high. The affected analytes were non-detects therefore the data has been reported.

Method 8270E: The continuing calibration verification (CCV) associated with batch 310-465217 recovered above the upper control limit for Dibenzo(a,h)anthracene(41.3%D) and Indeno[1,2,3-cd]pyrene(57.7%D). The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported. The associated sample is:(CCV 310-465217/2).

Method 8270E: The continuing calibration verification (CCV) associated with batch 310-465765 recovered above the upper control limit for 1,4-Naphthoquinone(30.7%D), 4-Chloro-3-methylphenol(20.7%D) and o-Toluidine(21.1%D). The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported. The associated sample is:(CCV 310-465765/6).

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

GC Semi VOA
No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Herbicides
Method 8151A: Surrogate recovery for the following samples were outside the upper control limit: AW-6_25_08 (310-314023-2), MW-12_25_08 (310-314023-4), MW-32_25_08 (310-314023-5), MW-34_25_08 (310-314023-7), FD-3_25_08 (310-314023-13) and FD-4_25_08 (310-314023-14). This sample did not contain any target analytes; therefore, re-extraction and/or re-analysis was not performed.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

PCBs
Method 8082A: Surrogate recovery for the following sample was outside the upper control limit: MW-34_25_08 (310-314023-7). This sample did not contain any target analytes; therefore, re-extraction and/or re-analysis was not performed.

Method 8082A: The ISTD for sample 310-314023-I-6-A failed low. Since this biases the analytes high and there were not detections, reanalysis was not performed and the data has been reported.

Method 8082A: Surrogate recovery for the following sample was outside the upper control limit: MW-33_25_08 (310-314023-6). This sample did not contain any target analytes; therefore, re-extraction and/or re-analysis was not performed.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Pesticides
Method 8081B: The continuing calibration verification (CCV) associated with batch 310-465011 recovered above the upper control limit for 4,4'-DDT and Methoxychlor. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported.

Method 8081B: The ISTD failed low for sample 310-314023-I-7-A. This biases the analytes high, so since there were no detections, reanalysis was not performed and the data has been reported.

Method 8081B: Surrogate recovery for the following sample was outside control limits: MW-34_25_08 (310-314023-7). Evidence

of matrix interference is present; therefore, re-extraction and/or re-analysis was not performed.

Method 8081B: The ISTD for 310-3104023-I-6-A failed low. Since this biases the analytes high and there were no detections, reanalysis was not performed and the data has been reported.

Method 8081B: The continuing calibration verification (CCV) associated with batch 310-465011 recovered above the upper control limit for 4,4'-DDT. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported. The associated sample is:(CCV 310-465011/7).

Method 8081B: The continuing calibration verification (CCV) associated with batch 310-465299 recovered above the upper control limit for 4,4'-DDT and Methoxychlor. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported.

Method 8081B: Surrogate recovery for the following sample was outside the upper control limit: MW-33_25_08 (310-314023-6). This sample did not contain any target analytes; therefore, re-extraction and/or re-analysis was not performed.

Method 8081B: The continuing calibration verification (CCV) associated with batch 310-465443 recovered above the upper control limit for 4,4'-DDT and Methoxychlor. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Metals
No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

General Chemistry
Method 9012B: Sample was stored at room temperature due to lab error.

MW-11_25_08 (310-314023-3)

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Qualifiers

GC/MS Semi VOA

Qualifier	Qualifier Description
*-	LCS and/or LCSD is outside acceptance limits, low biased.
*+	LCS and/or LCSD is outside acceptance limits, high biased.
*1	LCS/LCSD RPD exceeds control limits.
*3	ISTD response or retention time outside acceptable limits.
E	Result exceeded calibration range.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
S1+	Surrogate recovery exceeds control limits, high biased.

GC Semi VOA

Qualifier	Qualifier Description
*3	ISTD response or retention time outside acceptable limits.
S1+	Surrogate recovery exceeds control limits, high biased.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
☼	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Method: 8260D - Volatile Organic Compounds by GC/MS

Accreditation/Certification Summary

Client: Foth Infrastructure & Environment, LLC
Project/Site: CRLCSWA Site 1

Job ID: 310-314023-1
SDG: 25C051_25_08

Laboratory: Eurofins Cedar Falls

Unless otherwise noted, all analytes for this laboratory were covered under each accreditation/certification below.

Authority	Program	Identification Number	Expiration Date
Iowa	State	007	12-01-25

The following analytes are included in this report, but the laboratory is not certified by the governing authority. This list may include analytes for which the agency does not offer certification.

Analysis Method	Prep Method	Matrix	Analyte
8260D		Water	1,2,4-Trichlorobenzene
8260D		Water	Allyl chloride
8260D		Water	Ethyl methacrylate
8260D		Water	m,p-Xylene
8260D		Water	o-Xylene

Laboratory: Eurofins Chicago

All accreditations/certifications held by this laboratory are listed. Not all accreditations/certifications are applicable to this report.

Authority	Program	Identification Number	Expiration Date
Georgia	State	N/A	05-31-26
Georgia (DW)	State	939	05-31-26
Illinois	NELAP	100201	05-31-26
Indiana	State	C-IL-02	05-31-26

USDA	US Federal Programs	P330-18-00018	03-30-26
Wisconsin	State	399172840	08-27-25
Wyoming	State	8TMS-Q	05-31-26

* Accreditation/Certification renewal pending - accreditation/certification considered valid.

Method Summary

Client: Foth Infrastructure & Environment, LLC
Project/Site: CRLCSWA Site 1

Job ID: 310-314023-1
SDG: 25C051_25_08

Method	Method Description	Protocol	Laboratory
8260D	Volatile Organic Compounds by GC/MS	SW846	EET CF
8270E	Semivolatile Organic Compounds (GC/MS)	SW846	EET CF
8015C	Nonhalogenated Organic using GC/FID (Direct Aqueous Injection)	SW846	EET CF
8081B	Organochlorine Pesticides (GC)	SW846	EET CF
8082A	Polychlorinated Biphenyls (PCBs) by Gas Chromatography	SW846	EET CF
8151A	Herbicides (GC)	SW846	EET CHI
6020B	Metals (ICP/MS)	SW846	EET CF
7470A	Mercury (CVAA)	SW846	EET CF
9012B	Cyanide, Total andor Amenable	SW846	EET CF
9034	Sulfide, Acid soluble and Insoluble (Titrimetric)	SW846	EET CHI
I-3765-85	Residue, Non-filterable (TSS)	USGS	EET CF
3005A	Preparation, Total Metals	SW846	EET CF
3510C	Liquid-Liquid Extraction (Separatory Funnel)	SW846	EET CF
3511	Microextraction of Organic Compounds	SW846	EET CF
5030B	Purge and Trap	SW846	EET CF
7470A	Preparation, Mercury	SW846	EET CF
8151A	Extraction (Herbicides)	SW846	EET CHI
9012B	Cyanide, Total and/or Amenable, Distillation	SW846	EET CF
9030B	Sulfide, Distillation (Acid Soluble and Insoluble)	SW846	EET CHI

310-314023 Chain of Custody

Cooler/Sample Receipt and Temperature Log Form

Client Information

Client: Foth

City/State. CITY: Cedar Rapids STATE: IA Project.

Receipt Information

Date/Time Received: DATE: 6/22/25 TIME: 1330 Received By: BP

Delivery Type: ☐ UPS ☐ FedEx ☐ FedEx Ground ☐ US Mail ☐ Spee-Dee ☒ Lab Courier ☐ Lab Field Services ☐ Client Drop-off ☐ Other: _____

Condition of Cooler/Containers

Sample(s) received in Cooler?	☒ Yes	☐ No	*If yes:* Cooler ID.
Multiple Coolers?	☒ Yes	☐ No	*If yes:* Cooler # 1 of 6
Cooler Custody Seals Present?	☐ Yes	☒ No	*If yes:* Cooler custody seals intact? ☐ Yes ☐ No
Sample Custody Seals Present?	☐ Yes	☒ No	*If yes:* Sample custody seals intact? ☐ Yes ☐ No
Trip Blank Present?	☐ Yes	☒ No	*If yes:* Which VOA samples are in cooler? ↓

Temperature Record

Coolant: ☒ Wet ice ☐ Blue ice ☐ Dry ice ☐ Other: _____ ☐ NONE

Thermometer ID: R Correction Factor (°C): +0

• Temp Blank Temperature – If no temp blank, or temp blank temperature above criteria, proceed to Sample Container Temperature

Uncorrected Temp (°C): 0.3 Corrected Temp (°C): 0.3

• Sample Container Temperature

	CONTAINER 1	CONTAINER 2
Container(s) used:		
Uncorrected Temp (°C):		
Corrected Temp (°C):		

Exceptions Noted

1) If temperature exceeds criteria, was sample(s) received same day of sampling? ☐ Yes ☐ No
   a) *If yes:* Is there evidence that the chilling process began? ☐ Yes ☐ No

2) If temperature is <0°C, are there obvious signs that the integrity of sample containers is compromised? (e.g., bulging septa, broken/cracked bottles, frozen solid?) ☐ Yes ☐ No

NOTE If yes, contact PM before proceeding. If no, proceed with login

Data Validation Report

Project Name:	CRLCSWA Site 1 – Cedar Rapids, IA (25C051.00)
Task Name:	25C051_25_08
Data Set Description:	Fall 2025 Groundwater Event
Laboratory(s):	Eurofins – Cedar Falls, IA and Chicago, IL
Laboratory Sample Delivery Group (SDG) ID(s):	310-313508-1, 310-313751-1, 310-314023-1
Sample Collection Dates:	8/13/2025 – 8/20/2025
Sample Analysis Dates:	8/18/2025 – 9/7/2025
Sample Matrices:	Groundwater
Sample IDs Reviewed:	See Table 1
Verification and Validation Stage, 100% data:	☐ 1 ☒ 2A ☐ 2B ☐ 3 ☐ 4
Verified and Validated By:	Hannah Dubbs, Project Environmental Scientist 10/13/2025

The analytical data were validated to verify that laboratory quality assurance and quality control (QA/QC) procedures were documented and to evaluate the overall quality of the data reported. Analytical reports include 47 investigative groundwater samples collected via low-flow or no-purge sampling techniques at the Cedar Rapids Linn County Solid Waste Agency (CRLCSWA) Site 1 from August 13 to August 20, 2025; samples are listed in Table 1. The data were collected in accordance with the *Hydrologic Monitoring System Plan* (HRG, 2006), Iowa Department of Natural Resources (IDNR) Sanitary Disposal Closure Permit Number 57-SDP-03-75C (including Amendments), and 567 Iowa Administrative Code (IAC) 113.10.

Validation Summary

Stage 2A data validation was performed on 100% of the data from these SDGs, with review tasks and items of note documented in the summary table below.

Validation Task and Description	Review Notes	Action
Chain of Custody (COC) and Sample Receipt Form Confirm relinquish & receipt signatures. Confirm parameters and analytical methods match COC and Hydrologic Monitoring System Plan (HMSP).	All appropriate relinquish and receipt signatures were present with the exceptions listed below. Parameters and analytical methods analyzed match the COC and current sampling program with the exceptions below. The COCs associated with laboratory reports 310-313508-1, 310-313751-1, and 310-3134023-1 are missing the relinquished signature by the field personnel. The Cooler/Sample Receipt and Temperature Log Form provided the laboratory receipt information and indicated that the samples did not appear to have been compromised or tampered with and arrived in good condition. Therefore, no further action is required. Field personnel will be contacted regarding custody procedures.	Field personnel will be contacted regarding custody protocol

Validation Task and Description	Review Notes	Action
COC and Sample Receipt Form Continued	Trip blanks TB-4_25_08 and TB-5_25_08 were provided by the lab but were not analyzed since only three shipments of volatile samples occurred and trip blanks, TB-1_25_08, TB-2_25_08, and TB-3_25_08 were utilized as the trip blanks for those shipments.	Not applicable
	Eurofins inadvertently labeled sample MW-17_25_08 as MW- -17_25_08 in laboratory report 310-313751-1. Foth did not request a revised report. The sample name will be corrected in the laboratory electronic data deliverable (EDD) prior to data upload.	Mislabeled sample ID will be updated in the lab EDD prior to data upload.
	For MW-37_25_08, the field files noted the sample was taken at 12:25; however, field staff did not clearly indicate the time on the COC, and the laboratory interpreted the time as 12:05. Therefore, the laboratory reported the sample time as 12:05 in laboratory report 310-313508-1. A revised laboratory report was not requested. The sample time for MW-37_25_08 will be updated on the lab EDD prior to upload.	MW-37 sample time will be updated in the lab EDD prior to data upload.
	Tin was reported for MW-105A_25_08, MW-105B_25_08, MW-109A_25_08, and MW-109B_25_08 in laboratory report 310-314023-1 when it was not requested on the COC. Since tin is an additional parameter, no further action is required.	Not applicable
	Cobalt was reported for MW-108B_25_08 in laboratory report 310-314023-1 when it was not requested on the COC. Since cobalt is an additional parameter, no further action is required.	Not applicable
Case Narrative Review for items noted by the laboratory that may impact the validation process.	The case narrative for 310-313508-1 indicated that volatile organic analysis (VOA) vials for MW-38_25_08 were analyzed with headspace. According to the *National Functional Guidelines for Organic Superfund Methods Data Review* (USEPA, 2020a) for volatile organic compounds (VOCs), proper preservation includes the absence of headspace. Professional judgment was utilized to qualify the non-detect VOC results in MW-38_25_08 as UJ. Resampling is not recommended since MW-38 is a background well where VOCs are not anticipated to be detected, and background monitoring for VOCs is not required for compliance with the *Hydrologic Monitoring System Plan* (HRG, 2006), the Permit, and 567 IAC 113.10.	Qualifiers assigned; Resampling not recommended
	The case narrative for 310-314023-1 indicated the laboratory inadvertently stored the cyanide sample for MW-11_25_08 at room temperature. According to the *National Functional Guidelines for Inorganic Superfund Methods Data Review* (USEPA, 2020b) for cyanide, when aqueous samples are stored at a temperature greater than (>)10 degrees Celsius, non-detect cyanide results are rejected (qualified R). Cyanide was monitored at MW-11 in Fall 2025 as part of the five-year resampling for the full Appendix II list. Resampling is not recommended since cyanide has not been detected at MW-11 during previous semiannual or 5-year resampling events, no other Appendix II constituents were newly detected in Fall 2025, and cyanide has not been detected above the laboratory reporting limit at other downgradient wells at Site 1.	Qualifier assigned; Resampling not recommended

Validation Task and Description	Review Notes	Action
Case Narrative Continued	The remaining quality control issues noted in the case narratives were reviewed and found acceptable. Issues either were addressed in the comments below, had no impact on investigative samples, or were corrected/qualified by the laboratory. No additional actions are required. Note: continuing calibration verification (CCV) evaluation is not part of Stage 2A validation.	Not applicable
Sample Condition Upon Receipt (SCUR) Confirm samples in acceptable condition and no discrepancies noted. Confirm preservation meets method requirements.	With the exception identified below, samples were received by Eurofins – Cedar Falls, IA in acceptable conditions. In addition, the herbicide and sulfide sample shipments from Eurofins – Cedar Falls, IA to Eurofins – Chicago, IL were received in acceptable conditions. As detailed in the Case Narrative Review Notes, the VOA vials for MW-38_25_08 were analyzed with headspace; therefore, the non-detect VOC results were qualified UJ. Resampling was not recommended.	Not applicable Qualifier assigned; Resampling not recommended
Methods Requested Confirm methods match project requirements and lab provided all methods ordered.	The methods ordered and analyzed were performed in accordance with the project requirements. Methods include United States Environmental Protection Agency (USEPA) 8260D VOCs, USEPA 8270E Semivolatile Organic Compounds (SVOCs), USEPA 8015C Nonhalogenated Organics, USEPA 8151A Herbicides, USEPA 8081B Organochlorine Pesticides, USEPA 8082A Polychlorinated Biphenyls (PCBs), USEPA 8151A Herbicides, USEPA 6020B Total Metals, USEPA 7470A Mercury, USEPA 9012B Cyanide, USEPA 9034 Sulfide, and United States Geological Survey (USGS) I-3765-85 Total Suspended Solids (TSS).	Not applicable
Analytes Requested Confirm analytes ordered match project requirements and lab provided all analytes ordered.	The analytes requested were analyzed in accordance with the project requirements. The laboratory provided all analytes ordered. As detailed in the COC and Sample Receipt Form Review Notes, the following analytes were reported when not requested on the COC: tin for MW-105A_25_08, MW-105B_25_08, MW-109A_25_08, and MW-109B_25_08 in laboratory report 310-314023-1 and cobalt for MW-108B_25_08 in laboratory report 310-314023-1.	Not applicable Not applicable
Holding Times Confirm laboratory performed extractions and analyses within method-required holding times.	Eurofins performed analysis within the method-required holding times with the exceptions below. <u>310-313508-1</u> Analysis for SVOCs per USEPA Method 8270E is required to be extracted within 7 days of sampling and analyzed within 40 days of extraction. AW-1_25_08, MW-13_25_08, MW-14_25_08, and FD-1_25_08 were extracted outside the 7-day holding time, but analyzed within the 40-day holding time. Samples exceeded the 7-day extraction hold time by less than (<) 1 hour and approximately 4 hours, 3 hours, and 3 hours, respectively. In accordance with the *National Functional Guidelines for Organic Superfund Methods Data Review* (USEPA, 2020a), when SVOC samples are extracted outside the 7-day hold time and analyzed outside or within the 40-day holding time, detected SVOCs are qualified J- and non-detects are rejected (qualified R). Professional judgment was utilized not to qualify the non-detect SVOC results in AW-1_25_08, MW-13_25_08, MW-	No qualifiers assigned, resampling not recommended

Validation Task and Description	Review Notes	Action
Hold Times Continued	14_25_08, and FD-1_25_08 and detected dimethyl phthalate in MW-13_25_08 since the extraction holding times for SVOCs were only slightly exceeded (i.e., maximum 4 hours). SVOCs were monitored at AW-1, MW-13, and MW-14 in Fall 2025 as part of the five-year resampling for the full Appendix II list. Resampling is not recommended for AW-1, MW-13, and MW-14 since the extraction hold time was exceeded by less than 4 hours, and the results were not rejected. Except for one bis(2-ethylhexyl)phthalate at AW-1 in March 2009, SVOCs have not been detected at concentrations above the laboratory PQL in AW-1, MW-13, and MW-14. Resampling for FD-1 is not applicable since it is a quality control sample. Analysis for sulfide per USEPA Method 9034 is required to be extracted within 7 days of sampling and analyzed within 7 days of extraction. AW-2_25_08, MW-37_25_08, MW-38_25_08, and VP-3_25_08 were extracted outside the 7-day holding time, but analyzed within the 7-day holding time. Samples exceeded the 7-day extraction hold time by approximately 0.5 hours, 4.5 hours, 5 hours, and 2 hours, respectively. No guidance is provided in the *National Functional Guidelines for Inorganic Superfund Methods Data Review* (USEPA, 2020b) for sulfide analysis regarding this issue. However, professional judgment was utilized not to qualify the non-detect sulfide results in AW-2_25_08, MW-37_25_08, and MW-38_25_08, and the low-level result at VP-3 since the holding time was only slightly exceeded. Sulfide was monitored at AW-2, MW-37, MW-38, and VP-3 in Fall 2025 as part of the five-year resampling for the full Appendix II list. For AW-2, MW-37, and MW-38, resampling is not recommended since the extraction hold time was exceeded by less than 5 hours, the results were not rejected, and sulfide has not been detected at these wells previously. In addition, MW-37 and MW-38 are background wells, and background monitoring for sulfide is not required for compliance with the *Hydrologic Monitoring System Plan* (HRG, 2006), the Permit, and 567 IAC 113.10. Resampling for VP-3 is not recommended since the extraction hold time was missed by less than 2 hours, and the result was not rejected. Sulfide was detected for the first time at VP-3 during this sampling event, despite the extraction holding time exceedance, which would typically result in low-biased concentrations due to sulfide degradation. <u>310-313751-1</u> Analysis for pesticides per USEPA Method 8081B is required to be extracted within 7 days of sampling and analyzed within 40 days of extraction. MW-24_25_08, MW-25_25_08, and MW-28_25_08 were extracted outside the 7-day holding time, but analyzed within the 40-day holding time. Samples exceeded the 7-day extraction hold time by approximately 2 hours, 1.5 hours, and 1.5 hours, respectively. In accordance with the *National Functional Guidelines for Organic Superfund Methods Data Review* (USEPA, 2020a), when pesticide samples are extracted outside the 7-day hold time and analyzed outside or within the 40-day holding time, detected pesticides are qualified J and non-detects are rejected (qualified R). Professional	See above No qualifiers assigned, resampling not recommended No qualifiers assigned, resampling not recommended

Validation Task and Description	Review Notes	Action
Hold Times Continued	judgment was utilized not to qualify the non-detect pesticide results in MW-24_25_08, MW-26_25_08, and MW-28_25_08 since the extraction holding times for pesticides were only slightly exceeded. Pesticides were monitored at MW-24, MW-25, and MW-28 in Fall 2025 as part of the five-year resampling for the full Appendix II list. Resampling is not recommended since the extraction hold times were missed by 2 hours or less, the results were not rejected, and pesticides have not been detected at these wells previously.	See above
Blanks Confirm no detections in laboratory method blanks, field blanks, and trip blanks.	Table 3 presents analytes detected in the method and field blanks. No detections were found in the trip blanks. 310-313508-1 Mercury was detected in the method blank (MB 310-464229/1-A) at a concentration of 0.0002149 milligrams per liter (mg/L). In accordance with the *National Functional Guidelines for Inorganic Superfund Methods Data Review* (USEPA, 2020b) for mercury, when the blank concentration is greater than or equal to (≥) the practical quantitation limit (PQL), associated non-detect sample results are not qualified. Benzyl alcohol was detected in the field blank (FB-1_25_08) at a concentration of 5.07 J micrograms per liter (ug/L). In accordance with the *National Functional Guidelines for Organic Superfund Methods Data Review* (USEPA, 2020a) for SVOCs, when the blank concentration is J-flagged, associated non-detect sample results are not qualified. 310-313751-1 Styrene was detected in the field blank (FB-2_25_08) at a concentration of 0.611 J ug/L. In accordance with the *National Functional Guidelines for Organic Superfund Methods Data Review* (USEPA, 2020a) for VOCs, when the blank concentration is J-flagged, associated non-detect sample results are not qualified.	No qualifiers assigned No qualifiers assigned No qualifiers assigned
Surrogates or Deuterated Monitoring Compounds For *organic analyses only*, confirm surrogates analyzed and surrogate recovery within QC limits.	Table 4 presents the surrogate recoveries that were outside the control limits. 310-313751-1 The DCB decachlorobiphenyl and tetrachloro-m-xylene surrogate recoveries for MW-30_25_08 were above the upper acceptance limit, indicating potential high bias for PCBs in this sample. In accordance with the *National Functional Guidelines for Organic Superfund Methods Data Review* (USEPA, 2020a) for PCBs, when surrogate recovery is above the recovery limit and below the expanded upper acceptance limit (200%), associated non-detect sample results are not qualified. The terphenyl – D14 surrogate recoveries for FD-2_25_08 and MW-26_25_08 were above the upper acceptance limit, indicating potential high bias for SVOCs in these samples. In accordance with the *National Functional Guidelines for Organic Superfund Methods Data Review* (USEPA, 2020a) for SVOCs, when base/neutral surrogate	No qualifiers assigned No qualifiers assigned

Validation Task and Description	Review Notes	Action
Surrogates or Deuterated Monitoring Compounds Continued	recovery is above the recovery limit, associated non-detect base/neutral SVOCs are not qualified. <u>310-314023-1</u> The 2,4-dichlorophenylacetic acid surrogate recoveries for FD-3_25_08, FD-4_25_08, AW-6_25_08, MW-12_25_08, MW-32_25_08, and MW-34_25_08 were above the upper acceptance limit, indicating high bias for herbicides in these samples. In accordance with the *National Functional Guidelines for Organic Superfund Methods Data Review* (USEPA, 2020a) for herbicides, when surrogate recovery is above the recovery limit and below the expanded upper acceptance limit (200%), non-detect herbicides in the samples are not qualified. When surrogate recovery is above the recovery limit and above the expanded upper acceptance limit (200%), professional judgment is used for non-detects. Professional judgment was used to not qualify the herbicide results in FD-3_25_08, FD-4_25_08, AW-6_25_08, and MW-12_25_08 since the samples are potentially biased high, which would have little or no effect on the non-detect herbicide results. The DCB decachlorobiphenyl and tetrachloro-m-xylene surrogate recoveries for MW-33_25_08 and MW-34_25_08 were above the upper acceptance limit, indicating potential high bias for pesticides in these samples. In accordance with the *National Functional Guidelines for Organic Superfund Methods Data Review* (USEPA, 2020a) for pesticides, when surrogate recovery is above the recovery limit and below the expanded upper acceptance limit (200%), non-detect pesticides in the samples are not qualified. The DCB Decachlorobiphenyl and tetrachloro-m-xylene surrogate recoveries for MW-33_25_08 and MW-34_25_08 were above the upper acceptance limit, indicating potential high bias for PCBs in these samples. In accordance with the *National Functional Guidelines for Organic Superfund Methods Data Review* (USEPA, 2020a) for PCBs, when surrogate recovery is above the recovery limit and below the expanded upper acceptance limit (200%), non-detect PCBs in the samples are not qualified.	No qualifiers assigned No qualifiers assigned No qualifiers assigned
Matrix Spike/Matrix Spike Duplicates (MS/MSD) Confirm, for Organic analytes, MSD relative percent difference (RPD) within limits. For inorganic analytes, lab replicate RPD within limits.	MS/MSD quality control samples are not required for this project. As a result, no MS/MSD samples were collected or submitted for analysis. Where analyzed and reported by the laboratory, MS/MSD results associated with the samples in 310-313508-1, 310-313751-1, and 310-314023-1are reviewed under Stage 2A validation guidelines. Table 5 presents MS/MSD recoveries and RPDs that were outside the control limits. Qualifiers are assigned in Table 9. <u>310-313508-1</u> The MS recoveries for acetonitrile and isobutanol associated with AW-1_25_08 were below the recovery limits, indicating potential low bias. However, MSD recoveries for acetonitrile and isobutanol associated with AW-1_25_08 were within the recovery limits. No qualifiers were assigned since qualifiers are typically only applied	No qualifiers assigned

Validation Task and Description	Review Notes	Action
MS/MSD Continued	when both the MS and MSD recoveries are outside the recovery limits. In addition, the RPDs were above the RPD limit. No guidance is provided in the *National Functional Guidelines for Organic Superfund Methods Data Review* (USEPA, 2020a) for non-halogenated organic compound analysis regarding this issue. However, professional judgment was utilized not to qualify the associated non-detect acetonitrile and isobutanol results when the RPD is > the specified upper acceptance limit. Note that this is consistent with the required action for MS/MSD RPD exceedances with associated non-detect results for the organic compound groups covered by the guidance. The MS and MSD recoveries for sulfide associated with FB-1_25_08 were below the recovery limit (75%-125%), indicating potential low bias. No guidance is provided in the *National Functional Guidelines for Inorganic Superfund Methods Data Review* (USEPA, 2020b) for sulfide analysis. However, professional judgment was utilized to evaluate qualifiers based on the protocols for anions. For anions, when the MS and MSD recovery is within 35%-79%, associated non-detect results are qualified UJ.	See above Qualifier assigned
Laboratory Control Sample/Laboratory Control Sample Duplicates (LCS/LCSDs) Confirm LCS analyzed and LCS/LCSD recovery and RPD within lab specified limits.	LCS/LCSD quality control samples are not required for this project. A review of LCS/LCSD was not conducted as part of this analysis due to the resource demands associated with the evaluation. Qualifiers assigned by the laboratory are accepted for data usability purposes.	Not applicable
Laboratory Duplicates Confirm lab duplicates analyzed and RPD within lab specified limits.	Laboratory duplicate quality control samples are not required for this project. Where analyzed and reported by the laboratory, laboratory duplicate results associated with the samples in 310-313508-1, 310-313751-1, and 310-314023-1 are reviewed under Stage 2A validation guidelines. Table 7 is intended to present the lab duplicate sample RPDs that were outside the RPD limits. Lab duplicate RPDs were within control limits for these sample delivery groups (SDGs).	Not applicable
Field Duplicates Confirm field duplicates collected at required frequency and field duplicate RPD within acceptable limits.	Field duplicate samples were collected at a 1 per 10 frequency in accordance with the project requirements. Table 8 contains the precision evaluation of the parent/field duplicate samples. Qualifiers are assigned in Table 9. The low-level RPD for 1,1-dichloroethane between MW-30_25_08 and corresponding field duplicate FD-2_25_08 exceeded the laboratory reporting limit. In accordance with the approved Data Verification, Validation, and Qualification Standard Operating Procedure (SOP), when the low-level RPD is greater than 5x the PQL, non-detects are qualified UJ, and detects are qualified J.	Qualifiers assigned

Abbreviations:
> = greater than
≥ = greater than or equal to

Abbreviations Continued:
< = less than
CCV = continuing calibration verification
COC = chain of custody
EDD = electronic data deliverable
HMSP = Hydrologic Monitoring System Plan
LCS = laboratory control sample
LCSD = laboratory control sample duplicate
mg/L = milligrams per liter
MS = matrix spike
MSD = matrix spike duplicate
PCB = polychlorinated biphenyls
PQL = Practical Quantitation Limit
QA = quality assurance
QC = quality control
RPD = relative percent difference
SCUR = sample condition upon receipt
SDG = sample delivery group
SOP = standard operating procedure
SVOC = semivolatile organic compound
ug/L = microgram per liter
USEPA = United States Environmental Protection Agency
USGS = United States Geological Survey
TSS = total suspended solids
VOA = volatile organic analysis
VOC = volatile organic compound

Overall Assessment of Data

Item	Acceptable		Comments
	Yes	No	
1. Method Criteria		X	Samples were collected, preserved, shipped/delivered, and analyzed within the method protocols, with the exceptions listed below. As detailed in the Case Narrative Review Notes, the VOA vials for MW-38_25_08 were analyzed with headspace; therefore, the non-detect VOC results were qualified UJ. In addition, the laboratory inadvertently stored the cyanide sample for MW-11_25_08 at room temperature; therefore, the result was rejected (qualified R). Resampling was not recommended for VOCs in MW-38 and cyanide in MW-11. As further described in the Hold Times Review Notes, there were multiple extraction hold time exceedances in SDGs 310-313508-1 and 310-313751-1. Professional judgment was utilized not to qualify the associated results. Resampling was not recommended since the extraction holding times were only slightly exceeded and results were not rejected. The analyte/well pairs with extraction holding time exceedances were relatively low compared to the total number of results analyzed.

Item	Acceptable		Comments
	Yes	No	
2. Precision	X		Field precision was evaluated through investigative and field duplicate RPDs. The RPDs between the investigative and field duplicate samples were within the duplicate sample validation criteria, with the exception below. As further detailed in the Field Duplicates Review Notes, the RPD for 1,1-dichloroethane between MW-30_25_08 and the corresponding field duplicate FD-2_25_08 exceeded the low-level RPD limit. Therefore, the non-detect result in MW-30_25_08 was qualified non-detect and the detection in FD-2_25_08 was qualified J. Laboratory precision was evaluated through MS/MSD, LCS/LCSD, and laboratory duplicate RPDs. As noted in the LCS/LCSDs Review Notes, a review of LCS/LCSD was not conducted as part of this analysis . Where analyzed and reported by the laboratory, laboratory duplicate RPDs were within control limits, and MS/MSD RPDs were within control limits, with the exception below. As detailed in the MS/MSD Review Notes, the MS/MSD RPD limits were exceeded for acetonitrile and isobutanol associated with AW-1_25_08, indicating the results may be estimated values. Professional judgment was utilized not to qualify the associated non-detect acetonitrile and isobutanol results in AW-1_25_08.
3. Accuracy	X		Accuracy was evaluated through surrogate, MS/MSD, and LCS/LCSD recovery. As noted in the LCS/LCSDs Review Notes, a review of LCS/LCSD was not conducted as part of this analysis. The percent recoveries for surrogates and MS/MSDs were within control limits with the exceptions below. As listed in Table 4, several PCB, SVOC, herbicide, and pesticide surrogate recoveries were above the recovery limits. No qualifiers were applied since the associated sample results were non-detect. As listed in Table 5, the MS recoveries for acetonitrile and isobutanol associated with AW-1_25_08 were below the recovery limits and MSD recoveries were within the recovery limits. No qualifiers were assigned since qualifiers are typically only applied when both the MS and MSD recoveries are outside the recovery limits. For sulfide associated with FB-1_25_08, MS/MSD recoveries were below the recovery limit, indicating potential low bias. Professional judgment was utilized to qualify the associated non-detect results as UJ.
4. Representativeness	X		Sampling was conducted in accordance with the sample collection procedures described in the approved HMSP, approved HMSP revisions, and SOPs.
5. Comparability	X		Collection techniques, measurement procedures, methods, and reporting were equivalent to currently approved procedures and are comparable to historical data.
6. Completeness	X		Valid analytical results exceeded 90%.

Item	Acceptable		Comments
	Yes	No	
7. Suitability for Intended Use	X		No evidence of gross contamination or significant issues with the method criteria, precision, accuracy, representativeness, comparability, or completeness were identified.

Overall, the data reported are of good quality and the results for the QA/QC measurements that were used by the laboratories during the analysis of the samples were generally acceptable. Some sample results required qualification during data validation because method-specific QA/QC criteria were not met; results may be qualified for more than one reason. Qualified data are usable (unless qualified as rejected [R]), represent data of good quality and reasonable confidence, and have an acceptable degree of uncertainty (i.e., may be less precise or less accurate than unqualified data). Table 2 provides a definition of the qualifiers that may be assigned by the validator and/or retained from the laboratory. A summary of the validation qualifiers is provided below.

- No results were qualified as biased low (assigned as J- qualifiers), biased high (assigned as J+ qualifiers), non-detect at a concentration less than the reporting limit (assigned as U), and presumptive evidence of presence of an analyte (assigned as N or NJ qualifiers).
- One result (0.01%) was qualified as estimated (assigned as J).
- 63 results (0.62%) were qualified as non-detect with the reporting limit an estimated value (UJ).
- One result (0.01%) was not usable and rejected (assigned as R qualifier).
- 99.99% of the reported data is usable for project data quality objectives.

Table 2
Explanation of Qualifiers

Qualifier	Explanation
U	The analyte was analyzed for and was not detected above the numerical quantitation limit.
J	The analyte was analyzed for and was positively identified, but the analytical result (i.e., quantitation) is an estimated value. In some cases it is recognized that the estimated value is biased high (J+) suggesting the actual value is lower than estimated; or biased low (J-) suggesting the actual value is higher than estimated.
UJ	The analyte was analyzed for and was not detected above the reporting limit, but the reporting limit is an estimated value.
R	The analyte was analyzed for but may or may not be present and/or quantifiable due to quality control issues. The analytical result is not usable and should be rejected.
N	The analysis indicates presumptive evidence of the presence of the analyte.
NJ	The analysis indicates presumptive evidence of the presence of the analyte, but the numerical value is an estimated quantity.

Notes:
Results qualified as "J" or "UJ" are of acceptable data quality and may be used quantitatively per United States Environmental Protection Agency guidelines.

Table 3

310-313508-19 MSD							

Notes:
% = percent
MS = matrix spike
MSD = matrix spike duplicate
RPD = relative percent difference

Table 6
Laboratory Control Sample and Laboratory Control Sample Duplicate Exceedances

Lab Sample ID	Associated SDG Batch	Parameter	LCS % Recovery	LCSD % Recovery	% Recovery Limits	RPD	RPD Limit
LCS/LCSDs were not reviewed for these SDGs.							

Notes:
% = percent
LCS = laboratory control sample
LSCD = laboratory control sample duplicate
RPD = relative percent difference
SDG = sample delivery group

Table 7
Laboratory Duplicate Sample Exceedances

Lab Sample ID	Client Sample ID	Parameter	RPD	RPD Limit
Lab duplicate sample RPDs were within the RPD limits for these SDGs.				

Notes:
RPD = relative percent difference

Table 8
Relative Percent Difference (RPD) Analysis for Field Duplicate Samples
Appendix II Constituents & TSS

RPD = $\dfrac{\text{absolute value (a - b)}}{\text{(a + b)/2}} \times 100\%$

Acceptance Criteria*: 35%

* Unless otherwise noted in project planning documents, the acceptance criteria for field duplicates RPD is as follows:
- For analytes with concentrations greater than 5x (2x for soil matrices) the reporting limit, the RPD should be within 35% for water matrices (50% for soil matrices).
- For analytes with either or both concentrations less than 5x (2x for soil matrices) the reporting limit (indicated below by "low-level"), the absolute difference between the sample and field duplicate should not exceed 5x the reporting limit.

Duplicate Result Analysis:

AW-1_25_09	310-313508-1	USEPA 9034	Sulfide	0.231	U	mg/L	1.00	UJ	Associated MS/MSD were below the lower acceptance limit, indicating potential low bias. Qualified UJ since result is non-detect.
MW-30_25_08	310-313751-10	USEPA 8260	1,1-Dichloroethane	0.220	U	ug/L	1.00	UJ	RPD for sample and FD results exceeded the low-level RPD limit. Qualified UJ since the sample result was non-detect.
FD-2_25_08	310-313751-19	USEPA 8260	1,1-Dichloroethane	9.97		ug/L	9.97	J	RPD for sample and FD results exceeded the low-level RPD limit. Qualified J since the duplicate result was > PQL.

Notes:
This table only lists validator qualified data. Not all laboratory qualified data are listed; only the laboratory qualified data that was validator qualified are included.
> = greater than
< = less than
FD = field duplicate
MDL = minimum detection limit
mg/L - milligrams per liter
PQL = practical quantitation limit
RPD = relative percent difference
ug/L = micrograms per liter
USEPA = United States Environmental Protection Agency
VOA = volatile organic analysis

December 2025 Sampling Event

Site Name: Cedar Rapids Linn County Solid Waste Agency Site 1 | Permit No.: 57-SDP-03-75C
Well/Piezometer: CRL-9 | Weather: Partly cloudy, 24°F, SSW wind 10-30 mph, 30.1" Hg
Date: 12/2/2025 | Personnel: O.A. Technical Services: Tyler Merritt & Curtis Schwartz

Monitoring Well Details

Borehole diameter (in): 8.68 | Casing Diameter (in): 2 | Ground surface elevation (ft. MSL): 734.10
Top of screen (ft. MSL): 672.89 | Materials: PVC | Top of Casing elevation (ft. MSL): 736.59
Locked (Y/N): Yes

	Static WL	Before purging	Before sampling
Water Level (ft. TOC):	33.16	33.16	33.12
Water elevation (ft. MSL):	703.43	703.43	703.47

3 Well Volumes (gal): 19.82 | Screen submerged? (Y/N): Yes

	Constructed	Measured	Difference
Well Depth (ft. TOC):	73.70	73.65	0.05

Well conditions commentary: Well conditions are inspected annually - scheduled for the Fall 2026 event.

Sampling Details

Sampling Method: X Pump (low flow) | ___ No-purge (specify sample interval): ___
___ Bailer | ___ Other (specify): ___

Equipment type: ___ Submersible pump | ___ Peristaltic pump | X Bladder pump
___ Inertial lift pump | ___ Bailer | ___ No-purge (specify): ___
___ Other (specify): ___

Equipment name/description: QED Sample Pro Bladder Pump | Dedicated? (Y/N): No | Disposable? (Y/N): No
Decontamination method: disposable tubing/bladder; Alconox/DI rinse on pump

Equipment depth (ft. MSL:) 668.59 | Flow Rate (mL/min): 150 | Volume removed (gal): 0.9 | Volume sampled (L): 1.00
Well dry? (Y/N): No | Odor? (Y/N): No | Color? (Y/N): No

Sample Name(s)	Method(s)	Container(s)	Filtered? (if yes, filter size)
CRL-9_25_12	USEPA 8270E - o-Toluidine	(2) Amber Glass 250 mL - Unpreserved	No
	USEPA 9034 - Sulfide	(1) Plastic 500 mL - $ZnC_4H_6O_4$ + NaOH	No

Field Analysis

			Final Reading
Time	13:26	13:30	13:34
Temp (°C)	9.00	9.23	9.21
Sp. Cond (umhos/cm)	4755.4	4772.3	4774.1
pH	7.11	7.12	7.12
DO (mg/l)	0.55	0.43	0.38
ORP (mV)	-146.7	-148.3	-149.0
Turbidity (NTU)	0.00	0.00	0.00

Comments: Field blank (FB-1_25_12) collected at 13:30.

Job Notes

This report may not be reproduced except in full, and with written approval from the laboratory. The results relate only to the samples tested. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

The test results in this report relate only to the samples as received by the laboratory and will meet all requirements of the methodology, with any exceptions noted. This report shall not be reproduced except in full, without the express written approval of the laboratory. All questions should be directed to the Eurofins Environment Testing North Central, LLC Project Manager.

Job Narrative
310-321654-1

The analytical test results presented in this report meet all requirements of the associated regulatory program listed on the Accreditation/Certification Summary Page, unless otherwise noted. Data qualifiers and/or narrative comments are included to explain any exceptions, if applicable. Regulated compliance samples (e.g. SDWA, NPDES) must comply with associated agency requirements/permits.

- Matrix-specific batch QC (e.g., MS, MSD, SD) may not be reported when insufficient sample volume is available or when site-specific QC samples are not submitted. In such cases, a Laboratory Control Sample Duplicate (LCSD) may be analyzed to provide precision data for the batch.
- For samples analyzed using surrogate and/or isotope dilution analytes, any recoveries falling outside of established acceptance criteria are re-prepared and/or re-analyzed to confirm results, unless the deviation is due to sample dilution or otherwise explained in the case narrative.

Receipt
The samples were received on 12/3/2025 4:00 PM. Unless otherwise noted below, the samples arrived in good condition, and, where required, properly preserved and on ice. The temperature of the cooler at receipt time was 1.3°C.

GC/MS Semi VOA
Method 8270E: Internal standard (ISTD) response for the following sample(s) was below of acceptance limits creating a positive bias in the analytical results. (MB 310-475521/1-A) had no detections therefore the data has been reported.

Method 8270E: The RPD of the laboratory control sample (LCS) and laboratory control sample duplicate (LCSD) for preparation batch 310-475521 and analytical batch 310-476094 recovered outside control limits for the following analytes O-Toluidine.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Pesticides
No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

General Chemistry
No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Definitions/Glossary

Client: Foth Infrastructure & Environment, LLC
Job ID: 310-321654-1
Project/Site: CRLCSWA

Qualifiers

GC/MS Semi VOA

Qualifier	Qualifier Description
*3	ISTD response or retention time outside acceptable limits.

General Chemistry

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
☼	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Cooler/Sample Receipt and Temperature Log Form

Client Information

Client: Foth

City/State: CITY | STATE | Project

Receipt Information

Date/Time Received: DATE 12/3/25 | TIME 1600 | Received By: J

Delivery Type: ☐ UPS ☐ FedEx ☐ FedEx Ground ☐ US Mail ☐ Spee-Dee
☑ Lab Courier ☐ Lab Field Services ☐ Client Drop-off ☐ Other: _____

Condition of Cooler/Containers

Sample(s) received in Cooler? ☑ Yes ☐ No — *If yes:* Cooler ID

Multiple Coolers? ☐ Yes ☑ No — *If yes:* Cooler # _____ of _____

Cooler Custody Seals Present? ☐ Yes ☐ No — *If yes:* Cooler custody seals intact? ☐ Yes ☐ No

Sample Custody Seals Present? ☐ Yes ☐ No — *If yes* Sample custody seals intact? ☐ Yes ☐ No

Trip Blank Present? ☐ Yes ☐ No — *If yes:* Which VOA samples are in cooler? ↓

Temperature Record

Coolant: ☑ Wet ice ☐ Blue ice ☐ Dry ice ☐ Other: _____ ☐ NONE

Thermometer ID: IR3 | Correction Factor (°C): 0

• **Temp Blank Temperature** – If no temp blank, or temp blank temperature above criteria, proceed to Sample Container Temperature

Uncorrected Temp (°C): 1.3 | Corrected Temp (°C): 1.3

• **Sample Container Temperature**

Container(s) used:	CONTAINER 1	CONTAINER 2
Uncorrected Temp (°C)		
Corrected Temp (°C)		

Exceptions Noted

1) If temperature exceeds criteria, was sample(s) received same day of sampling? ☐ Yes ☐ No
   a) *If yes:* Is there evidence that the chilling process began? ☐ Yes ☐ No

2) If temperature is <0°C, are there obvious signs that the integrity of sample containers is compromised? (e.g., bulging septa, broken/cracked bottles, frozen solid?) ☐ Yes ☐ No

NOTE If yes, contact PM before proceeding If no, proceed with login

Data Validation Report

Project Name:	CRLCSWA Site 1 – Cedar Rapids, IA (25C051.00)
Task Name:	25C051_25_12
Data Set Description:	Winter 2025 Resample Event
Laboratory(s):	Eurofins – Cedar Falls, IA and Chicago, IL
Laboratory Sample Delivery Group (SDG) ID(s):	310-321654-1
Sample Collection Dates:	12/02/2025
Sample Analysis Dates:	12/8/2025 – 12/16/2025
Sample Matrices:	Groundwater
Sample IDs Reviewed:	See Table 1
Verification and Validation Stage, 100% data:	☐ 1 ☒ 2A Modified ☐ 2A ☐ 2B ☐ 3 ☐ 4
Verified and Validated By:	Hannah Dubbs, Project Environmental Data Scientist 1/9/2025

The analytical data were validated to verify that laboratory quality assurance and quality control (QA/QC) procedures were documented and to evaluate the overall quality of the data reported. Starting with the December 2025 resample event, data validation protocols reverted to Stage 2A Modified protocols. Under Stage 2A Modified protocols, matrix spike/matrix spike duplicate, laboratory control sample/laboratory control sample duplicate, and laboratory duplicate results are not evaluated.

Analytical reports include 3 investigative groundwater samples collected via low-flow or no-purge sampling techniques at the Cedar Rapids Linn County Solid Waste Agency (CRLCSWA) Site 1 on December 2, 2025; samples are listed in Table 1. The data were collected in accordance with the *Hydrologic Monitoring System Plan* (HRG, 2006), Iowa Department of Natural Resources (IDNR) Sanitary Disposal Closure Permit Number 57-SDP-03-75C (including Amendments), and 567 Iowa Administrative Code (IAC) 113.10.

Validation Summary

Stage 2A Modified data validation was performed on 100% of the data from this SDG, with review tasks and items of note documented in the summary table below.

Validation Task and Description	Review Notes	Action
Chain of Custody (COC) and Sample Receipt Form Confirm relinquish & receipt signatures. Confirm parameters and analytical methods match COC and Hydrologic Monitoring System Plan (HMSP).	All appropriate relinquish and receipt signatures were present. Parameters and analytical methods analyzed match the COC and current sampling program with the exception below.	Not applicable

Validation Task and Description	Review Notes	Action
Case Narrative Review for items noted by the laboratory that may impact the validation process.	The quality control issues noted in the case narratives were reviewed and found acceptable. Issues were either addressed in the comments below, had no impact on the investigative samples, or were corrected/qualified by the laboratory. No additional actions are required. Note: continuing calibration verification (CCV) and internal standard evaluation, matrix spike/matrix spike duplicate (MS/MSD), laboratory control sample/laboratory control sample duplicate (LCS/LCSD), and laboratory duplicate evaluations are not part of Stage 2A Modified validation.	Not applicable
Sample Condition Upon Receipt (SCUR) Confirm samples in acceptable condition and no discrepancies noted. Confirm preservation meets method requirements.	Samples were received by Eurofins – Cedar Falls, IA in acceptable conditions. In addition, the sulfide sample shipment from Eurofins – Cedar Falls, IA to Eurofins – Chicago, IL was received in acceptable conditions.	Not applicable
Methods Requested Confirm methods match project requirements and lab provided all methods ordered.	The methods ordered and analyzed were performed in accordance with the project requirements. Methods include United States Environmental Protection Agency (USEPA) 8270E Semivolatile Organic Compounds (SVOCs), USEPA 8081B Pesticides, and USEPA 9034 Sulfide.	Not applicable
Analytes Requested Confirm analytes ordered match project requirements and lab provided all analytes ordered.	The analytes requested were analyzed in accordance with the project requirements. The laboratory provided all analytes ordered.	Not applicable
Holding Times Confirm laboratory performed extractions and analyses within method-required holding times.	Eurofins performed analysis within the method-required holding times.	Not applicable
Blanks Confirm no detections in laboratory method blanks, field blanks, and trip blanks.	Table 3 is intended to present analytes detected in the method, field, and trip blanks. Trip blanks were not collected with this sample delivery group (SDG) since volatile organic compounds were not included in the analyses. No detections were found in the method and field blanks.	Not applicable
Surrogates or Deuterated Monitoring Compounds For *organic analyses only*, confirm surrogates analyzed and surrogate recovery within quality control (QC) limits.	Table 4 is intended to present the surrogate recoveries that were outside the control limits. Surrogates were within control limits for this SDG.	Not applicable

Validation Task and Description	Review Notes	Action
Field Duplicates Confirm field duplicates collected at required frequency and field duplicate RPD within acceptable limits.	Table 8 is intended to present the precision evaluation of the parent/field duplicate samples. No field duplicates were submitted for analysis. The event was limited to resampling for a few analyte/well pairs. Project requirements do not require a field duplicate for resampling events.	Not applicable

Abbreviations:
CCV = continuing calibration verification
COC = chain of custody
HMSP = Hydrologic Monitoring System Plan
ISTD = internal standard
LCS = laboratory control sample
LCSD = laboratory control sample duplicate
MS = matrix spike
MSD = matrix spike duplicate
QA = quality assurance
QC = quality control
RPD = relative percent difference
SCUR = sample condition upon receipt
SDG = sample delivery group
SVOC = semivolatile organic compound
USEPA = United States Environmental Protection Agency

Overall Assessment of Data

Item	Acceptable		Comments
	Yes	No	
1. Method Criteria	X		Samples were collected, preserved, shipped/delivered, and analyzed within the method protocols.
2. Precision	X		Field precision was not evaluated during this sampling event.
3. Accuracy	X		Accuracy was evaluated through surrogate recovery. As listed in Table 4, surrogate recoveries were within the control limits.
4. Representativeness	X		Sampling was conducted in accordance with the sample collection procedures described in the approved HMSP, approved HMSP revisions, and SOPs.
5. Comparability	X		Collection techniques, measurement procedures, methods, and reporting were equivalent to currently approved procedures and are comparable to historical data.
6. Completeness	X		Valid analytical results exceeded 90%.
7. Suitability for Intended Use	X		No evidence of gross contamination or significant issues with the method criteria, precision, accuracy, representativeness, comparability, or completeness were identified.

Overall, the data reported are of good quality and the results for the applicable quality assurance/quality control (QA/QC) measurements that were used by the laboratories during the analysis of the samples were generally acceptable. Table 2 provides a definition of the qualifiers that may be assigned by the validator and/or retained from the laboratory. No sample results were qualified during data validation because method-specific QA/QC criteria were met. 100% of the data is usable for project data quality objectives.

Table 2
Explanation of Qualifiers

Qualifier	Explanation
U	The analyte was analyzed for and was not detected above the numerical quantitation limit.
J	The analyte was analyzed for and was positively identified, but the analytical result (i.e., quantitation) is an estimated value. In some cases it is recognized that the estimated value is biased high (J+) suggesting the actual value is lower than estimated; or biased low (J-) suggesting the actual value is higher than estimated.
UJ	The analyte was analyzed for and was not detected above the reporting limit, but the reporting limit is an estimated value.
R	The analyte was analyzed for but may or may not be present and/or quantifiable due to quality control issues. The analytical result is not usable and should be rejected.
N	The analysis indicates presumptive evidence of the presence of the analyte.
NJ	The analysis indicates presumptive evidence of the presence of the analyte, but the numerical value is an estimated quantity.

Notes:
Results qualified as “J” or “UJ” are of acceptable data quality and may be used quantitatively per United States Environmental Protection Agency guidelines.

Table 3
Method, Field, and Trip Blank Exceedances

Lab Report	Blank Type	Lab Sample ID	Analysis Batch	Prep Batch	Parameter	Result	Units	Lab Qualifier	MDL	PQL	Associated Samples
No detections were found in the method and field blanks.											

Notes:
MDL = minimum detection limit
PQL = practical quantitation limit

Table 4
Surrogate Recovery Exceedances

Lab Sample ID	Parent Sample	Parameter	Recovery	% Recovery Limits
Surrogates were within control limits for this SDG.				

Notes:
SDG = sample delivery group

Table 5
Relative Percent Difference (RPD) Analysis for Field Duplicate Samples
Appendix I Constituents & TSS

RPD = $\dfrac{\text{absolute value (a - b)}}{\text{(a + b)/2}} \times 100\%$

Acceptance Criteria*: 35%

* Unless otherwise noted in project planning documents, the acceptance criteria for field duplicates RPD is as follows:
- For analytes with concentrations greater than 5x (2x for soil matrices) the reporting limit, the RPD should be within 35% for water matrices (50% for soil matrices).
- For analytes with either or both concentrations less than 5x (2x for soil matrices) the reporting limit (indicated below by "low-level"), the absolute difference between the sample and field duplicate should not exceed 5x the reporting limit.

Duplicate Result Analysis:

Parameter	Unit	Parent	Duplicate Sample	RPD	Acceptable?
No field duplicate samples were collected.					

Notes:
RPD = relative percent difference

Table 6
Qualified Results from Data Validation

Sample ID	Lab Sample ID	Method	Parameter	Result	Lab Qualifier	Units	Qualified Result	Validator Qualifier	Explanation
No qualifiers were assigned during this evaluation.									

Notes:
This table only lists validator qualified data. Not all laboratory qualified data are listed; only the laboratory qualified data that was validator qualified are include

Updated Data Validation Standard Operating Procedure

Foth Infrastructure & Environment, LLC

Standard Operating Procedure

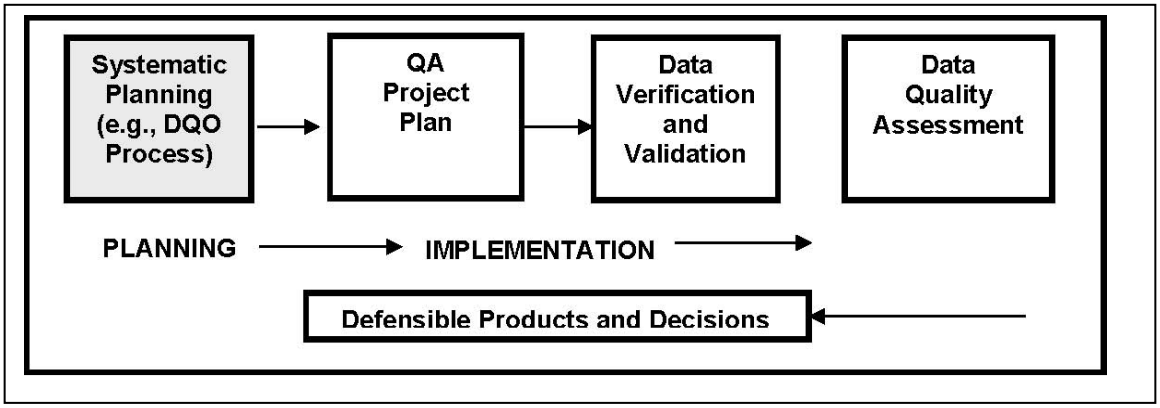
Data Verification, Validation, and Qualification

Introduction

The purpose of this Standard Operating Procedure (SOP) is to establish a procedure for the verification, validation, and qualification of laboratory analytical data. This SOP establishes guidelines for:

1. Reviewing project data quality objectives (DQOs) for environmental projects.
2. Selecting the appropriate stage (e.g., Stage 1, 2A, 2B, 3, 4) of analytical laboratory data verification and validation.
3. Selecting the appropriate level (e.g., Level I, II, III, IV) of analytical laboratory data deliverables for the intended stage of data verification and validation.
4. Performing data qualification.
5. Reporting results and data quality assessment.

This SOP assumes that the DQO process is complete. This SOP can be used during the development of a Quality Assurance Project Plan (QAPP) for specifying data quality procedures, or before, during, and after environmental sampling programs to aid in selection and execution of data quality procedures.



Definitions

Data Review – The process of examining and/or evaluating data to varying levels of detail and specificity. Data review includes verification, validation, and usability assessment.

Verification – Completeness check to confirm that the specified analytical requirements have been met. For this guidance, *data verification* consists of a completeness check to confirm that all data requested from the laboratory have been received and comply with specified requirements.

Validation – Confirmation that the accuracy and quality data requirements are fulfilled for a specific intended use. For this guidance, *data validation* consists of analyte and sample specific process for evaluating compliance of the laboratory data received with methods, procedures, or contract requirements.

Data Verification and Validation

The USEPA Superfund Analytical Services Contract Laboratory Program (USEPA CLP) website includes the most current guidance for analytical laboratory data verification and validation: https://www.epa.gov/clp. Historical guidance for laboratory analytical data verification and validation includes the following documents:

USEPA, 1987. *A Compendium of Superfund Field Operations Methods.* EPA/540/P-87/001. Office of Solid Waste and Emergency Response, Washington, D.C. December.

USEPA, 2002. *Guidance on Environmental Data Verification and Data Validation.* EPA QA/G-8. Office of Environmental Information, Washington, D.C. November. https://www.epa.gov/quality/guidance-environmental-data-verification-and-data-validation.

USEPA, 2009. *Guidance for Labeling Externally Validated Laboratory Analytical Data for Superfund Use.* EPA 540-R-08-005. Office of Solid Waste and Emergency Response, Washington, D.C. January 13.

Data Qualification

The USEPA CLP website includes the most current National Functional Guidelines for analytical laboratory data review and qualification data: https://www.epa.gov/clp/superfund-clp-national-functional-guidelines-data-review, and includes the following documents (as of January 2022):

USEPA, 2020. *National Functional Guidelines for Superfund Organic Methods Data Review*. EPA 540-R-20-005. Office of Superfund Remediation and Technology Innovation, Washington D.C. November.

USEPA, 2020. *National Functional Guidelines for Inorganic Superfund Methods Data Review*. EPA 542-R-20-006. Office of Superfund Remediation and Technology Innovation, Washington D.C. November.

USEPA, 2020. *National Functional Guidelines for High Resolution Superfund Methods Data Review*. EPA 542-R-20-007. Office of Superfund Remediation and Technology Innovation, Washington D.C. November.

Personnel Qualifications

None, according to USEPA guidance documents.

Equipment and Supplies

Materials referenced in this SOP include:

- Project planning documents, such as a QAPP, Sampling and Analysis Plan (SAP), Hydrologic Monitoring System Plan (HMSP) or project Work Plan that state project DQOs, including performance and acceptance/usability criteria. This SOP assumes that DQOs for the project have already been established.
- Laboratory hard copy analytical data deliverables.
- Laboratory electronic analytical data deliverables (EDDs).

Procedures

Review Objectives and Determine Stage of Review

1. Review the Project DQOs to ensure understanding of data type, location, quantity, and quality needed to make defensible decisions. The performance and acceptance criteria are established in the project DQOs.

2. Select data verification and validation stage, as established in the project planning document.

    a. Stage 1 – A verification and validation based only on completeness and compliance of sample receipt condition checks. Checks include a comparison of reported results against DQOs (e.g., sample locations, field quality control (QC) samples, analytical methods, analyte counts, units, reporting limits, etc.), method preservation requirements (e.g., temperature, pH, headspace, etc.), assessment of non-QC laboratory qualifiers (e.g., primary sample holding time, primary sample dilution, etc.), and assessment of transcription or reporting errors.

    b. Stage 2A – A verification and validation based on completeness and compliance checks of sample receipt conditions and **ONLY** sample-related QC results. Checks include a review of instrument performance related results such as field QC samples (e.g., TB, FB, EB, FD, etc.) and analytical method QC samples (e.g., MB, LCS/LCSD, MS/MSD, surrogates, etc.). Stage 2A Modified excludes review of laboratory QC results (e.g., LCS/LCSD, MS/MSD, and laboratory duplicates).

    c. Stage 2B – A verification and validation based on completeness and compliance checks of sample receipt conditions and **BOTH** sample-related and instrument-related QC results. Checks include a review of instrument tuning related results such as the number, concentration, and frequency of calibration standards (e.g., initial calibration standards, ICV, ICB, CCV, CCB, etc.), as well the curves, percent recovery/difference, equations, calculations, weighting factors, and/or correlation coefficients as appropriate.

    d. Stage 3 – A verification and validation based on completeness and compliance checks of sample receipt conditions, **BOTH** sample-related and instrument-related QC results, **AND** recalculation checks (to check for computational errors). Stage 3 Validation requires the use of the laboratory reported instrument response data to recalculate calibration windows, analyte retention time, analyte concentration, and instrument performance QC sample recovery (e.g., percent recovery [%R], relative percent difference [RPD], etc.). The results of these recalculations are compared to the results of the laboratory calculations for accuracy.

e. Stage 4 – A verification and validation based on completeness and compliance checks of sample receipt conditions, both sample-related and instrument-related QC results, recalculation checks, **AND** review of the laboratory raw instrument output to check for parameterization errors. Stage 4 Validation requires the use of the laboratory raw instrument output to determine analyte identification and analyte quantitation from analyte-specific characteristics (e.g., column retention time, fluorescence, etc.) expressed as a signal in the raw instrument output. The results of this determination are compared to the laboratory determination for accuracy.

3. Select the level of laboratory analytical data deliverables. The laboratory can provide data at different levels, with each level including increasing amounts of information and detail.

   a. Level I – Cover sheet, case narrative, analytical results, sample receiving log, and Chain of Custody (COC). This report is suitable for meeting Stage 1 data verification and validation.

   b. Level II – Level I plus quality control summaries, QC qualifier legend sample summary, lab certification reports, sample analyte count, QC cross-reference table, transfer log. This report is suitable for meeting Stages 1 and 2A data verification and validation.

   c. Level III – Level II plus calibration data, tuning, and check data. This report is suitable for meeting Stages 1, 2A, and 2B data verification and validation.

   d. Level IV – Level III plus instrument run logs, raw data. This report is suitable for meeting Stages 1, 2A, 2B, 3, and 4 data verification and validation.

Perform Data Verification, Validation, and Qualification

Perform Stage 2A Modified data verification, validation, and qualification following procedures described in current USEPA CLP National Functional Guidelines and outlined below. Additional guidance regarding analyte, method, and/or instrument specific qualification may be found on the USEPA CLP website.

1. Confirm that all investigative and field QC samples planned were collected and received by the laboratory by looking at the field notes, COC, and project planning documents.

2. Verify that sample names and times were documented correctly on the COC, that sample names align with project planning documents, and confirm relinquish & receipt signatures.

3. Review the laboratory report case narrative for items noted by the laboratory that may impact the validation process.

4. Confirm sample receipt at laboratory in acceptable condition and confirm preservation meets method requirements. Any samples analyzed out of preservation requirements should be reviewed for potential bias.

5. Confirm that analytes and methods match the project planning documents and that the laboratory provided all analytes and methods ordered.

6. Confirm laboratory performed extractions and analyses within method-required holding times. Any samples extracted or analyzed out of holding time should be reviewed for potential bias.

7. Confirm field, method, and trip blanks were collected at the frequency specified in the project planning documents. Confirm no detections in laboratory method blanks, field blanks, and trip blanks. If detections are identified in the blank results, actions to be taken, including applying data qualifiers, will be conducted in accordance with the current USEPA CLP National functional guidelines unless otherwise specified in the project planning documents. A summary of the blank

evaluation criteria and actions based on the USEPA CLP National Functional Guidelines dated November 2020 is provided in Attachment 1.

8. For *organic analyses only*, confirm surrogates (or deuterated monitoring compounds) were analyzed and evaluate surrogate recovery compared to laboratory's surrogate acceptance limits or surrogate acceptance limits specified in the project planning documents. If surrogate recovery is outside the acceptance limits, actions to be taken, including applying data qualifiers, will be conducted in accordance with the current UESPA CLP National Functional Guidelines unless otherwise specified in the project planning documents. A summary of the surrogate evaluation criteria and actions based on the USEPA CLP National Functional Guidelines dated November 2020 is provided in Attachment 1.

9. Confirm field duplicates were collected at the frequency specified in the project planning documents. If the parent and duplicate sample concentrations are greater than or equal to (≥) 5x the PQL, the RPD between parent and duplicate sample concentrations will be calculated using the following equation:

$$RPD = \frac{(A - B)}{A + B/2} \times 100$$

Where:
A = analytical result from one of two duplicate measurements
B = analytical result from the second measurement

Precision measurements can be affected by how close a chemical concentration is to the practical quantitation limit, which can increase the percent error (or RPD). Therefore, in cases where either the parent or the duplicate sample concentration is less than (<) 5x the PQL, the absolute difference between the parent and duplicate sample concentrations will be calculated (i.e., low-level RPD).

Unless otherwise specified in the project planning documents, the acceptance criteria for field duplicate RPDs are as follows:

a. The field duplicate RPD criteria are less than or equal to (≤) 30 percent (%) for water samples and ≤ 50% for soil samples.

b. For low-level RPD comparisons, the absolute difference between the parent and duplicate sample concentrations shall not exceed 5x the PQL.

c. If either of these criteria are not met, both sample results should be qualified J or UJ. Detected results will be assigned a J qualifier, and non-detects will be assigned a UJ qualifier.

Data Qualifiers

The following data qualifiers may be used during data validation and/or retained from the laboratory.

- U = The analyte was analyzed for and was not detected above the numerical quantitation limit (i.e., reporting limit).
- J = The analyte was analyzed for and was positively identified, but the analytical result (i.e., quantitation) is an estimated value. In some cases, it is recognized that the estimated value is biased high (J+), suggesting the actual value is lower than estimated; or biased low (J-), suggesting the actual value is higher than estimated.

- UJ = The analyte was analyzed for and was not detected above the reporting limit, but the reporting limit is an estimated value.
- R = The analyte was analyzed for but may or may not be present and/or quantifiable due to quality control issues. The analytical result is not usable and should be rejected.
- N = The analysis indicates presumptive evidence of the presence of the analyte.
- NJ = The analysis indicates presumptive evidence of the presence of the analyte, but the numerical value is an estimated quantity.

Results qualified J (J, J+, and J-) or UJ are of acceptable data quality and may be used quantitatively per USEPA guidelines.

Reporting

The results of the data quality procedures should be summarized into a deliverable. An example deliverable used to communicate the results of Stage 2A Modified data validation is provided in Attachment 2. The deliverable should include an overall data quality assessment relative to the project DQOs and state if the data set is usable for the intended purposes of the project. The overall data quality assessment may include the following evaluations:

- Method Criteria: Review of the methods and analytes requested, chain of custody and sample receipt forms, sample conditions upon receipt, and holding times to ensure that samples were collected, preserved, shipped/delivered, and analyzed within the method protocols.
- Precision: Defined as the agreement between a set of replicate measurements without assumption or regard about the true value and is a measure of the reproducibility of individual measurements. Field duplicate samples will be used to assess precision.
- Accuracy: An expression of the degree to which a measured value represents the true value. Accuracy will be assessed through a review of surrogate, matrix spike, and laboratory control sample results. Accuracy will be defined as the percent recovery (%R) of an analyte in a reference standard or spiked sample. The acceptance criteria are dependent on the analytical method and established by individual laboratories. Acceptable accuracy will be defined as achieving %R within the recovery limits established by the analytical laboratory for the method utilized.
- Representativeness: The degree that data accurately and precisely represents the environment and conditions that the sample targeted. Representativeness will be achieved by conducting sampling in accordance with the sample collection procedures described in the project planning documents.
- Comparability: Expresses the confidence with which one data set can be evaluated in relation to another data set. Data are considered comparable if collection techniques, measurement procedures, methods, and reporting are equivalent for the samples within a sample set. Note that methods of sample collection and analyses may differ due to geologic and hydrogeologic conditions at individual sample locations and through time, meaning some data sets vary in comparability. To the extent practicable, consistent sampling techniques and analytical methods should be utilized.
- Completeness: Measures the amount of data determined to be valid relative to the amount of data collected. Completeness is also a measure of the amount of valid data generated versus the amount of data planned for collection, ensuring sufficient data are available to make project decisions. A completeness goal for most projects will be 90%.

- Suitability for Intended Use: An overall review of the event data to ensure that results are applicable for their intended use. If gross contamination or significant issues with the method criteria, precision, accuracy, representativeness, comparability, or completeness are identified, the reviewer may indicate that entire event data may not be suitable for use, and resampling or other corrective actions may be required.

Attachment 1

Summary of Data Validation Evaluation Criteria and Actions

(Based on the USEPA CLP National Functional Guidelines dated November 2020)

Foth Infrastructure & Environment, LLC

Summary of Data Validation Evaluation Criteria and Actions

This attachment provides the evaluation criteria and actions recommended for review of blank samples and surrogates based on the USEPA CLP National Functional Guidelines dated November 2020.

Blank Review

Blank Result	Sample Result	Action
VOCs and Non-Halogenated Organic Compounds (Method 8015B)		
>MDL and <PQL	Non-Detect	No qualification
	>MDL and <PQL	Qualify U and report at PQL
	≥PQL but <Blank Multiplier (1)	Qualify U and report at PQL
	≥PQL and ≥Blank Multiplier (1)	Qualify J+ and report at sample result or no qualification
≥PQL	Non-Detect	No qualification
	>MDL and <PQL	Qualify U and report at PQL
	≥PQL but <Blank Multiplier (1)	Qualify U and report at sample result
	≥PQL and ≥Blank Multiplier (1)	Qualify J+ and report at sample result or no qualification
SVOCs, Pesticides, Herbicides, and PCBs		
>MDL and <PQL	Non-Detect	No qualification
	>MDL and <PQL	Qualify U and report at PQL
	≥PQL	Qualify J+ and report at sample result or no qualification
≥PQL	Non-Detect	No qualification
	>MDL and <PQL	Qualify U and report at PQL
	≥PQL but <Blank	Qualify U and report at sample result
	≥PQL and ≥Blank	Qualify J+ and report at sample result or no qualification
Metals (ICP-AES and ICP-MS Methods), Mercury, Cyanide, Anions, and Total Organic Carbon		
>MDL and <PQL	Non-Detect	No qualification
	>MDL and <PQL	Qualify U and report at PQL
	≥PQL	Qualify J+ and report at sample result or no qualification
≤MDL but >QL	Non-Detect	UJ (2)
	Detect	J- or no qualification
≥PQL	Non-Detect	No qualification
	>MDL and <PQL	Qualify U and report at PQL
	≥PQL but <10x Blank	Qualify J+ and report at blank result or R
	≥PQL and ≥10x Blank	No qualification

MDL = minimum detection limit
PCB = polychlorinated biphenyl
PQL = practical quantitation limit
SVOC = semivolatile organic compound
VOC = volatile organic compound

(1) For VOCs, a blank multiplier of 1x will generally be utilized. For common laboratory contaminants (2-butanone, acetone, methylene chloride), a blank multiplier of 2x will be used.

(2) For cyanide, the action is no qualification.

Foth Infrastructure & Environment, LLC

Surrogates or Deuterated Monitoring Compounds

Criteria	Action [1,2]	
	Detect	Non-Detect
VOCs and Non-Halogenated Organic Compounds (Method 8015B)		
%R < Expanded Lower Acceptance Limit (10%)	J-	R
Expanded Lower Acceptance Limit (10%) ≤ %R < specified Lower Acceptance Limit	J-	UJ
%R within specified Acceptance Limits	No qualification	No qualification
%R > specified Upper Acceptance Limit	J+	No qualification
SVOCs		
%R < Expanded Lower Acceptance Limit (10%, excluding surrogates with 10% as the lower acceptance limit, undiluted sample analysis)	J-	R
Expanded Lower Acceptance Limit (10%) ≤ %R (excluding surrogates with 10% as the lower acceptance limit, undiluted sample analysis) < specified Lower Acceptance Limit	J-	UJ
%R < specified Lower Acceptance Limit (diluted sample analysis)	Use professional judgment	Use professional judgment
%R within specified Acceptance Limits	No qualification	No qualification
%R > specified Upper Acceptance Limit	J+	No qualification
Pesticides, Herbicides, and PCBs		
%R < Expanded Lower Acceptance Limit (10%, undiluted sample)	J-	R
%R < Expanded Lower Acceptance Limit (10%, diluted sample)	Use professional judgment	Use professional judgment
Expanded Lower Acceptance Limit (10%) ≤ %R < specified Lower Acceptance Limit	J-	UJ
%R within specified Acceptance Limits	No qualification	No qualification
Upper Acceptance Limit < %R ≤ Expanded Upper Acceptance Limit (200%)	J+	No qualification
%R > Expanded Upper Acceptance Limit (200%)	J+	Use professional judgment

%R = percent recovery
PCB = polychlorinated biphenyl
SVOC = semivolatile organic compound
VOC = volatile organic compound

(1) For VOCs, pesticides, herbicides, and PCBs, qualifiers are assigned to all target analytes in the method for the individual sample the surrogate was analyzed with.

(2) For SVOCs, qualifiers are not assigned to all target analytes in the method for the individual sample the surrogate was analyzed with, but rather a shorter list of target analytes in the method list. The analytical laboratory or project planning document should be consulted for associated target SVOC analytes corresponding to each surrogate.

Example Deliverable for Stage 2A Modified Data Validation

Foth Infrastructure & Environment, LLC

Data Validation Report

Project Name:	
Task Name:	
Data Set Description:	
Laboratory(s):	
Laboratory Sample Delivery Group (SDG) ID(s):	
Sample Collection Dates:	
Sample Analysis Dates:	
Sample Matrices:	
Sample IDs Reviewed:	See Table 1
Verification and Validation Stage, 100% data:	☐ 1 ☒ 2A Modified ☐ 2A ☐ 2B ☐ 3 ☐ 4
Verified and Validated By:	

The analytical data were validated to verify that laboratory quality assurance and quality control (QA/QC) procedures were documented and to evaluate the overall quality of the data reported. Analytical reports include [insert number and type of samples collected and collection method] at [insert site] from [insert sample collection dates]; samples are listed in Table 1. The data were collected in accordance with [insert references to the project planning documents and/or regulatory codes].

Validation Summary

Stage 2A Modified data validation was performed on 100% of the data from these sample delivery groups (SDGs), with review tasks and items of note documented in the summary table below.

Validation Task and Description	Review Notes	Action
Chain of Custody (COC) and Sample Receipt Form Confirm relinquish & receipt signatures. Confirm parameters and analytical methods match COC and project planning documents.		
Case Narrative Review for items noted by the laboratory that may impact the validation process.		

Foth Infrastructure & Environment, LLC

Validation Task and Description	Review Notes	Action
Sample Condition Upon Receipt (SCUR) Confirm samples in acceptable condition and no discrepancies noted. Confirm preservation meets method requirements.		
Methods Requested Confirm methods match project requirements and lab provided all methods ordered.		
Analytes Requested Confirm analytes ordered match project requirements and lab provided all analytes ordered.		
Holding Times Confirm laboratory performed extractions and analyses within method-required holding times.		
Blanks Confirm no detections in laboratory method blanks, field blanks, and trip blanks.		
Surrogates or Deuterated Monitoring Compounds For *organic analyses only*, confirm surrogates analyzed and surrogate recovery within QC limits.		
Field Duplicates Confirm field duplicates collected at required frequency and field duplicate RPD within acceptable limits.		

Abbreviations:
COC = Chain of Custody
EDD = electronic data deliverable
LCS = laboratory control sample
LCSD = laboratory control sample duplicate
MS = matrix spike
MSD = matrix spike duplicate
RPD = relative percent difference
SCUR = Sample Condition Upon Receipt

Overall Assessment of Data

Item	Acceptable		Comments
	Yes	No	
1. Method Criteria			
2. Precision			
3. Accuracy			
4. Representativeness			
5. Comparability			
6. Completeness			
7. Suitability for Intended Use			

Overall, the data reported are of good quality and the results for the applicable quality assurance/quality control (QA/QC) measurements that were used by the laboratories during the analysis of the samples were generally acceptable. Some sample results required qualification during data validation because method-specific QA/QC criteria were not met; results may be qualified for more than one reason. These qualified data are usable, represent data of good quality and reasonable confidence, and have an acceptable degree of uncertainty (i.e., may be less precise or less accurate than unqualified data). Table 2 provides a definition of the qualifiers that may be assigned by the validator and/or retained from the laboratory. A summary of the validation qualifiers is provided below.

- No results were qualified as [insert qualifiers not utilized].
- Insert discussion on number of results that were assigned qualifiers. For example: Two results (0.1%) were qualified as estimated (assigned as J qualifiers).
- [Insert percent] of the data is usable for project data quality objectives.

RE: Site 1 Statistical Analysis - Spring 2025 Evaluation

1 Memorandum Organization

This memo addresses the statistical analysis of the groundwater monitoring data collected in March 2025. The statistical methods and results are summarized, with the memo organization given as follows:

Page
1 Memorandum Organization 1
2 Background 2
3 Statistical Methodology 4
3.1 Background Data Set Adjustments 4
3.1.1 Adjustments Associated with Turbidity and Total Suspended Solids 4

2 Background

The groundwater monitoring locations and status of the Appendix I and II sampling schedules are summarized in Tables 1 and 2. The Appendix I and II analytical results will be provided in Table 14 of the 2025 Annual Water Quality Report (AWQR).

In March 2025, semiannual corrective action, background, and delineation monitoring were conducted at the locations listed in Tables 1 and 2. Corrective action and background monitoring locations were sampled for the Appendix I and detected Appendix II constituents in March 2025. In accordance with Permit Amendment #6, resampling for the full Appendix II list at the corrective action and background monitoring wells is conducted every five years. The full Appendix II resampling dates will be provided in Table 2 of the 2025 AWQR.

As footnoted in Tables 1 and 2, annual monitoring at upper bedrock wells AW-1, AW-2, AW-3, AW-4, AW-5, MW-20, MW-21, MW-23, MW-24, MW-26, MW-28, MW-30, MW-34, MW-35, VP-3, VP-4, MW-105A, MW-106A, MW-107A, and MW-109A and deeper bedrock wells AW-6, CRL-9, MW-11, MW-15, MW-18, MW-19, MW-22, MW-25, MW-31, MW-36, MW-102B, MW-104B, MW-105B,

MW-107B, and MW-108B is scheduled for Fall 2025. Therefore, these locations were not monitored in March 2025.

Table 1
Upper Bedrock Monitoring Locations and Schedule [1]
Aug. 2008 – Mar. 2025 Appendix I & II Data

Monitoring Location	Monitoring Program	Current Schedule [2] (Mar. 2025)	Appendix I Initiated	# Events to Complete Baseline Appendix I or Completion Date [113.10(5)b]	Appendix II Initiated	# Events to Complete Baseline Appendix II or Completion Date [113.10(6)b]	Returned to Detection Monitoring (Yes/No)
Downgradient Monitoring Locations							
MW-12	Corrective Action	Appendix II	N/A	N/A	Aug-08	Sep-09	No
MW-13	Corrective Action	Appendix II	N/A	N/A	Aug-08	Sep-09	No
MW-16	Corrective Action	Appendix II	N/A	N/A	Aug-08	Sep-09	No
MW-17	Corrective Action	Appendix II	N/A	N/A	Aug-08	Sep-09	No
MW-32	Corrective Action	Appendix II	N/A	N/A	Aug-08	Sep-09	No
Background Monitoring Locations							
MW-37	Background	Appendix II	N/A	N/A	Aug-08	Sep-09	---
MW-101A	Background	Appendix II	Sep-13 [3]	Sep-14 [2]	Sep-13 [3]	Sep-14 [3]	---

N/A = Not applicable. Monitoring points were under routine parameter sampling per 567 IAC 113.2(5) prior to initiation of Appendix II.

[1] In accordance with Permit Amendment #16, annual monitoring at AW-1, AW-2, AW-3, AW-4, AW-5, MW-20, MW-21, MW-23, MW-24, MW-26, MW-28, MW-30, MW-34, MW-35, VP-3, VP-4, MW-105A, MW-106A, MW-107A, and MW-109A is scheduled for Fall 2025. Therefore, these locations were not monitored in Mar. 2025.

[2] Appendix II locations were sampled for the Appendix I and detected Appendix II constituents in Mar. 2025. Resampling for the full Appendix II list at the corrective action and background monitoring wells is conducted every five years.

[3] Six rounds of background monitoring for the Appendix II metals were conducted at MW-101A between Sep. 2013 and Mar. 2015. Background monitoring for the full Appendix II list was conducted in Sep. 2015, Mar. 2016, and Aug. 2020.

Table 2
Deeper Bedrock Monitoring Locations and Schedule [1]
Aug. 2008 – Mar. 2025 Appendix I & II Data

Monitoring Location	Monitoring Program	Current Schedule [2] (Mar. 2025)	Appendix I Initiated	# Events to Complete Baseline Appendix I or Completion Date [113.10(5)b]	Appendix II Initiated	# Events to Complete Baseline Appendix II or Completion Date [113.10(6)b]	Returned to Detection Monitoring (Yes/No)
Downgradient Monitoring Locations							
MW-14	Corrective Action	Appendix II	N/A	N/A	Aug-08	Sep-09	No
MW-33	Corrective Action	Appendix II	N/A	N/A	Aug-08	Sep-09	No

MW-38	Background	Appendix II	N/A	N/A	Aug-08	Sep-09	---
MW-101B	Background	Appendix II	Sep-13 [3]	Sep-14 [3]	Sep-13 [3]	Sep-14 [2]	---
Delineation Monitoring Locations							
MW-109B	Delineation	Appendix I	Nov-17	Nov-18	---	---	---

N/A = Not applicable. Monitoring points were under routine parameter sampling per 567 IAC 113.2(5) prior to initiation of Appendix II.

[1] In accordance with Permit Amendment #16, annual monitoring at AW-6, CRL-9, MW-11, MW-15, MW-18, MW-19, MW-22, MW-25, MW-31, MW-36, MW-102B, MW-104B, MW-105B, MW-107B, and MW-108B is scheduled for Fall 2025. Therefore, these locations were not monitored in Mar. 2025.

[2] Appendix II locations were sampled for the Appendix I and detected Appendix II constituents in Mar. 2025. Resampling for the full Appendix II list at the corrective action and background monitoring wells is conducted every five years.

[3] Six rounds of background monitoring for the Appendix II metals were conducted at MW-101B between Sep. 2013 and Mar. 2015. Two rounds of background monitoring for the full Appendix II list were conducted in Sep. 2015 and Mar. 2016.

As noted in the data validation report, which will be submitted with the 2025 AWQR, lead was detected in the field blank. Professional judgement was used to reject detected lead results at the associated samples: MW-33, MW-38, and MW-101B. Resampling was not recommended for

MW-38 and MW-101B since they are background wells and background monitoring for lead is not required for compliance with the project requirements. Resampling was recommended for MW-33 since downgradient monitoring for lead is required for compliance with the project requirements. Therefore, lead in MW-33 was not evaluated in this statistical evaluation and will be sampled prior to the next semiannual event.

Under the detection and assessment monitoring programs of 567 IAC 113.10(5) and 113.10(6), Appendix I and II monitoring results are statistically compared to background levels as given in 567 IAC 113.10(6)e and to the groundwater protection standard (GWPS) as given in 567 IAC 113.10(6)g and h. A well may return to detection monitoring when all Appendix II constituents are "shown to be at or below background values, using the statistical procedures in paragraph 113.10(4)g for two consecutive sampling events." Consequently, to return to detection monitoring in accordance with 567 IAC 113.10(6)e, all Appendix II constituents must be below the interwell prediction limit (for constituents which are detected in the background data set) or below the laboratory reporting limit (for constituents which are not detected in the background data set) during two consecutive sampling events. As mentioned in previous memos, three consecutive sampling events may be utilized to make the determination to return to detection monitoring to limit frequent fluctuation of wells moving between the detection and assessment monitoring programs. Assessment monitoring continues when Appendix II concentrations are above background values but below the GWPS using the statistical procedures in paragraph 113.10(4)g.

If Appendix II constituents are detected at statistically significant levels (SSLs) above the GWPS, characterization [567 IAC 113.10(6)g] is initiated and the owners or operators are required to begin an assessment of corrective measures, select a remedy, and implement a remedy in accordance with 567 IAC 113.10(7), (8), and (9). For remedy completion [567 IAC 113.10(9)e(2)], compliance with the GWPS is considered achieved by demonstrating that concentrations of Appendix II constituents have not exceeded the GWPS for a period of three consecutive years or an alternate length of time established by the IDNR.

Based on the August 2008 through March 2025 results, this memo presents an evaluation of statistically significant increases (SSIs) and SSLs under the requirements of paragraphs 113.10(4)g and h of 567 IAC.

3 Statistical Methodology

The statistical methods utilized for locations in delineation and corrective action monitoring were consistent with the methods used in previous statistical evaluations. Detailed descriptions of the statistical methods are provided in Attachment 1. Sanitas® v10.0 (Sanitas Technologies) software was utilized to complete the statistical comparisons.

The combined background data sets (MW-37 and MW-101A for the upper bedrock, and MW-38 and MW-101B for the deeper bedrock) were utilized to evaluate SSIs over background.

3.1 Background Data Set Adjustments

3.1.1 Adjustments Associated with Turbidity and Total Suspended Solids

No background data set adjustments are recommended for MW-37, MW-38, MW-101A, and MW-101B based on a review of the field turbidity and total suspended solids (TSS) data from the March 2025 sampling event. The March 2025 TSS concentrations at MW-37, MW-38, MW-101A, and MW-101B were below the 5 mg/L limit for acceptable sample quality.

The background data set adjustments previously recommended and incorporated based on review of turbidity data include:

- Removal of the high-volume September 2009 through September 2014 metals data at MW-101A (initiated with Fall 2016 statistical evaluation).
- Removal of the high-volume September 2009 through September 2014 and the initial low-flow March 2015 metals data at MW-101B (initiated with Fall 2016 statistical evaluation).
- Removal of the March 2019 barium concentration in MW-38 due to elevated TSS and the potential for turbidity to contribute to the higher barium concentration identified (initiated with Spring 2019 statistical evaluation).
- Removal of the March 2023 barium, cadmium, cobalt, copper, nickel, selenium, and vanadium concentrations in MW-101A due to elevated TSS and the potential for turbidity to contribute to the higher concentrations identified (initiated with the Spring 2023 statistical evaluation).

These data set adjustments were maintained in the current statistical evaluation. The removed background data will be listed as crossed-out concentrations in Table 14 of the 2025 AWQR.

Note that the historical high-volume data at the downgradient wells continue to be reviewed on a case-by-case basis. The downgradient data set review is discussed in Section 5.1.

3.1.2 Adjustments Associated with Practical Quantitation Limits

Due to lowering of the practical quantitation limits (PQLs), background data set adjustments were approved to remove earlier non-detect data with elevated PQLs for barium, cobalt, copper, and lead in the upper bedrock and for barium, beryllium, cadmium, cobalt, copper, lead, and nickel in the deeper bedrock due to the increased uncertainty the elevated PQLs added. IDNR approved the background dataset adjustments due to elevated PQLs in the letters dated May 12, 2016 and November 20, 2017 (IDNR, 2016 and 2017). These data set adjustments were maintained in the current statistical evaluation.

3.1.3 Review of Single Background Detections

During the September 2015 event, m/p-cresol and phenol were detected above the laboratory reporting limit at upper bedrock background well MW-37. These two constituents were not detected in either background well before or after the September 2015 event. As a result, m/p-cresol and phenol will not be evaluated using prediction limits unless additional background detections are identified. Downgradient m/p-cresol and phenol results continue to be evaluated using the double quantification rule (DQR).

Single volatile organic compound (VOC) detections were identified for carbon disulfide and toluene in MW-37 in August 2017. The November 2017 retest sample did not confirm the August 2017 detections; therefore, SSIs were not declared. Barium and cobalt were the only other detections in MW-37 in August 2017, and their concentrations were within the range of historical concentrations. Therefore, the August 2017 barium and cobalt results were maintained in the background data set for calculating interwell prediction limits. Since VOCs are considered “never detected” constituents, carbon disulfide and toluene were not added as

prediction limit constituents. Downgradient carbon disulfide and toluene results continue to be evaluated using the DQR.

Similarly, single VOC detections were identified for benzene, ethylbenzene, toluene, and total xylenes (BTEX) in MW-37 during the Fall 2018 sampling event. The August 2018 detected metals data at MW-37 was removed from the background dataset due to the potential impact indicated by the BTEX detections. The November 2018 retest sample did not confirm the August 2018 BTEX detections; therefore, SSIs were not declared. Since VOCs are considered "never detected" constituents, the BTEX constituents were not added as prediction limit constituents. Downgradient BTEX results continue to be evaluated using the DQR.

3.2 Corrective Action Constituents

In accordance with the Unified Guidance (USEPA, 2009), corrective action statistics are conducted for analyte/well pairs with previously identified SSLs, as listed in Table 3. No new corrective action constituents were added based on the results of the previous Fall 2024 statistical evaluation. In accordance with 567 IAC 113.10(9)e(2), cobalt in MW-35 returned to an assessment constituent in 2025 since compliance with the GWPS was maintained for three consecutive years. Since cobalt is the only corrective action constituent in MW-35, MW-35 returned to an assessment monitoring location.

Under corrective action statistics, comparisons to background are not conducted (except for cobalt in the upper bedrock under the corrective action hypothesis, further discussed in Section 5.2); therefore, the analyte/well pairs listed in Table 3 were not included in the Section 4 comparisons to background.

Table 3
Corrective Action Constituents [1]

Monitoring Location	Corrective Action Constituents [2]
Upper Bedrock Monitoring Locations	
AW-1	Arsenic
AW-2	Arsenic, Thallium
MW-12	Arsenic
MW-13	Arsenic
MW-16	Arsenic
MW-17	Arsenic
MW-20	Thallium
MW-24	Arsenic
MW-30	Arsenic
MW-32	Arsenic
MW-34	Arsenic, Vinyl Chloride
MW-105A	Cobalt
MW-106A	Arsenic, Cobalt
Deeper Bedrock Monitoring Locations	
AW-6	Cobalt
CRL-9	Arsenic, Cobalt
MW-14	Arsenic
MW-22	Arsenic, Cobalt
MW-33	Arsenic
MW-36	Arsenic
MW-105B	Cobalt
MW-109B	Arsenic; Cobalt; Thallium

(1) Table 3 lists the analyte/well pairs identified as corrective action constituents regardless of whether the monitoring location was sampled during the current event.
(2) Corrective action constituents are analyte/well pairs with SSLs over the GWPS identified during previous statistical evaluations and have not achieved compliance with the GWPS in accordance with 567 IAC 113.10(9)e(2).

4 Comparison to Background Levels

Comparisons to background levels were conducted using interwell prediction limits and the DQR. As noted in Section 3.2, comparisons to background were not conducted for the corrective action constituents listed in Table 3.

4.1 Interwell Prediction Limits

Interwell prediction limits were used for formal statistical assessment of SSIs over background for analytes that have been detected above the reporting limit in the combined background data set (MW-37 and MW-101A for the upper bedrock system; MW-38 and MW-101B for the deeper bedrock system). For the upper bedrock, these analytes included antimony, arsenic, barium, cobalt, copper, lead, nickel, tin, and zinc. For the deeper bedrock, these analytes included antimony, arsenic, barium, bis(2-ethylhexyl)phthalate, cadmium, cobalt, copper, nickel, tin, and zinc. Note that interwell prediction limit comparisons were not conducted for arsenic during this statistical evaluation since arsenic is a corrective action constituent in the upper and deeper bedrock locations that were sampled during the March 2025 event. The March 2025 downgradient arsenic concentrations in the upper and deeper bedrock will be evaluated using corrective action statistics.

4.1.1 Upper Bedrock

The upper bedrock prediction limits calculated utilizing August 2008 through March 2025 sample data are summarized in Table 4. The background data set adjustments discussed in Section 3.1 were utilized.

Table 4
Prediction Limit Summary - Upper Bedrock
Aug. 2008 – Mar. 2025 Interwell Data (1)

Chemical Name	Prediction Limit	Units	Prediction Limit Type	Retesting Plan	Prediction Limit Method
Antimony	0.00739	mg/L	Non-Parametric	1-of-2	Maximum Order Statistic
Arsenic (2)	0.00205	mg/L	Non-Parametric	1-of-2	Maximum Order Statistic
Barium	0.1354	mg/L	Parametric (Lognormal)	1-of-2	$\exp(\bar{y} + k \cdot s_y)$
Cobalt	0.008	mg/L	Non-Parametric	1-of-2	Maximum Order Statistic
Copper	0.0225	mg/L	Non-Parametric	1-of-2	Maximum Order Statistic
Lead	0.00695	mg/L	Non-Parametric	1-of-2	Maximum Order Statistic
Nickel	0.0522	mg/L	Non-Parametric	1-of-2	Maximum Order Statistic
Tin	0.152	mg/L	Non-Parametric	1-of-2	Maximum Order Statistic
Zinc	0.0805	mg/L	Non-Parametric	1-of-2	Maximum Order Statistic

(1) Interwell data consists of the Appendix I and II parameters that have been detected in the combined background data set (MW-37 and MW-101A). Note that background data set adjustments were incorporated in accordance with Section 3.1.
(2) Interwell prediction limit comparisons were not conducted for arsenic during this statistical evaluation since arsenic is a corrective action constituent in the upper bedrock location sampled during the March 2025 event. The arsenic prediction limit was calculated for reference; however, there were no downgradient comparisons to this limit for the Spring 2025 evaluation.

Non-parametric prediction limits were used for antimony, arsenic, cobalt, copper, lead, nickel, tin, and zinc since either normality assumptions could not be met or there were less than 50%

detects in the combined background data. A parametric lognormal prediction limit was used with barium since there were greater than 50% detects in the combined background data set, the assumptions of normality were met with a lognormal transformation, and the lognormal limit was accepted as being representative of the background distribution.

4.1.2 Deeper Bedrock

Deeper bedrock prediction limits calculated from August 2008 through March 2025 sample data are summarized in Table 5. The background data set adjustments discussed in Section 3.1 were utilized.

Table 5
Prediction Limit Summary - Deeper Bedrock
Aug. 2008 – Mar. 2025 Interwell Data [1]

Chemical Name	Prediction Limit	Units	Prediction Limit Type	Retesting Plan	Prediction Limit Method
Antimony	0.0101	mg/L	Non-Parametric	1-of-2	Maximum Order Statistic
Arsenic [2]	0.00225	mg/L	Non-Parametric	1-of-2	Maximum Order Statistic
Barium	0.138	mg/L	Non-Parametric	1-of-2	Maximum Order Statistic
Bis(2-ethylhexyl) phthalate [3]	25.4	ug/L	Non-Parametric	1-of-2	Maximum Order Statistic
Cadmium	0.000824	mg/L	Non-Parametric	1-of-2	Maximum Order Statistic
Cobalt	0.0008513	mg/L	Parametric (Lognormal with Kaplan-Meier Adjustment)	1-of-2	$\exp(\hat{\mu}_{KM} + k \cdot \hat{\sigma}_{KM})$
Copper	0.0108	mg/L	Non-Parametric	1-of-2	Maximum Order Statistic
Nickel	0.00735	mg/L	Non-Parametric	1-of-2	Maximum Order Statistic
Tin [3]	0.109	mg/L	Non-Parametric	1-of-2	Maximum Order Statistic
Zinc	0.0366	mg/L	Non-Parametric	1-of-2	Maximum Order Statistic

[1] Interwell data consists of the Appendix I and II parameters that have been detected in the combined background data set (MW-38 and MW-101B). Note that background data set adjustments were incorporated in accordance with Section 3.1.
[2] Interwell prediction limit comparisons were not conducted for arsenic during this statistical evaluation since arsenic is a corrective action constituent in the deeper bedrock location sampled during the March 2025 event. The arsenic prediction limit was calculated for reference; however, there were no downgradient comparisons to this limit for the Spring 2025 evaluation.
[3] Bis(2-ethylhexyl)phthalate and tin were included only for corrective action monitoring locations.

Non-parametric prediction limits were used for antimony, arsenic, barium, bis(2-ethylhexyl)-phthalate, cadmium, copper, nickel, tin, and zinc since either normality assumptions could not be met or there were less than 50% detects in the combined background data. A parametric lognormal prediction limit was used with cobalt since there were greater than 50% detects in the combined background data set, the assumptions of normality were met with a lognormal transformation, and the lognormal limit was accepted as being representative of the background distribution.

4.1.3 Prediction Limit Exceedances

A summary of the monitoring locations exhibiting a prediction limit exceedance during the March 2025 event is given in Table 6 for the upper bedrock system and Table 7 for the deeper bedrock system. Detailed prediction limit output for each analyte/well pair is included in Attachment 2.

Table 6
Mar. 2025 Prediction Limit Exceedances – Upper Bedrock

Prediction Limit	Barium (mg/L) 0.1354	Nickel (mg/L) 0.0522
Corrective Action Monitoring Locations – Assessment Constituents		
MW-12	0.851	
MW-13	0.846	
MW-32	0.748	0.0847

Table 7
Mar. 2025 Prediction Limit Exceedances - Deeper Bedrock

Prediction Limit	Barium (mg/L) 0.138	Cobalt (mg/L) 0.0008513	Nickel (mg/L) 0.00735	Zinc (mg/L) 0.0366
Delineation Monitoring Locations – Assessment Constituents				
MW-109B	0.613		0.0315	
Corrective Action Monitoring Locations – Assessment Constituents				
MW-14	0.539		0.0138	0.197
MW-33	0.615	0.0013		

4.2 Double Quantification Rule

The DQR was used to evaluate SSIs over background for the remaining Appendix I and II constituents (i.e., constituents which have not been detected above the reporting limit in the combined background data set). The DQR output is included in Attachment 3, with a summary of the March 2025 DQR detections listed in Table 8 for the upper bedrock wells and in Table 9 for the deeper bedrock wells.

Table 8
Upper Bedrock Double Quantification Rule
Mar. 2025 Detections

Well	Constituent(s)
Corrective Action Monitoring Locations - Assessment Constituents	
MW-12	1,1-Dichloroethane; 1,4-Dichlorobenzene; Chlorobenzene; cis-1,2-Dichloroethene
MW-13	1,2-Dichlorobenzene; 1,4-Dichlorobenzene; Benzene; Chlorobenzene
MW-16	1,4-Dichlorobenzene; Chlorobenzene
MW-32	1,4-Dichlorobenzene; Chlorobenzene

Table 9
Deeper Bedrock Double Quantification Rule
Mar. 2025 Detections

Well	Constituent(s)
Delineation Monitoring Locations - Assessment Constituents	
MW-109B	1,4-Dichlorobenzene; Chlorobenzene
Corrective Action Monitoring Locations (Assessment Constituents)	
MW-14	1,1-Dichloroethane; 1,2-Dichlorobenzene; 1,4-Dichlorobenzene; Benzene; Chlorobenzene
MW-33	1,4-Dichlorobenzene; Chlorobenzene

4.3 Summary of Comparison to Background

4.3.1 Delineation Monitoring Locations – Assessment Constituents

For the deeper bedrock system, prediction limit exceedances and DQR detections were identified at MW-109B as listed in Tables 7 and 9. In lieu of retesting for the prediction limit exceedances and DQR detections, SSIs were declared and evaluated for SSLs in Section 5.

4.3.2 Corrective Action Monitoring Locations – Assessment Constituents

For the upper bedrock system, no prediction limit exceedances or DQR detections were identified at MW-17. Prediction limit exceedances were identified at MW-12, MW-13, and MW-32 as listed in Table 6. DQR detections were identified at MW-12, MW-13, MW-16, and MW-32 as listed in Table 8. In lieu of retesting for the prediction limit exceedances and DQR detections, SSIs were declared and evaluated for SSLs in Section 5.

For the deeper bedrock system, prediction limit exceedances and DQR detections were identified at MW-14 and MW-33 as listed in Tables 7 and 9. In lieu of retesting for the prediction limit exceedances and DQR detections, SSIs were declared and evaluated for SSLs in Section 5.

5 Comparison to Groundwater Protection Standard

The prediction limit exceedances and DQR detections listed in Tables 6 through 9 were declared SSIs and evaluated for SSLs over the GWPS per 567 IAC 113.10(6)f and g. Comparisons to the GWPS were evaluated through statistical confidence intervals under the assessment monitoring null hypothesis. SSLs were declared to exist with statistical certainty when the lower confidence limit exceeds the GWPS. Statistical outputs for confidence intervals in assessment mode are included in Attachment 4.

In contrast, corrective action analyte/well pairs (i.e., those where SSLs have been previously declared) were evaluated to determine compliance with the GWPS per 567 IAC 113.10(9)e. A summary of the upper and deeper bedrock corrective action constituents was provided in Table 3. Comparisons to the GWPS in this case were evaluated through statistical confidence intervals under the corrective action monitoring null hypothesis, or in the case of downward trending data, confidence bands (upper 95% confidence limits) placed around the linear trend line. For corrective action constituents, compliance with the GWPS has been achieved with statistical certainty when the UCL or the upper 95% confidence limit on the trend line is lower than the GWPS for a period of three consecutive years or an alternate length of time established by the IDNR. Statistical outputs for regression statistics, confidence bands, and confidence intervals in corrective action mode are included in Attachment 5.

5.1 Compliance Data Set Review for Confidence Intervals

5.1.1 Adjustments Due to Changes in PQLs

As noted in Section 3.1, downgradient data set adjustments were approved to remove earlier non-detect data with elevated PQLs for upper bedrock cobalt data at AW-5, MW-13, MW-17, MW-23, and MW-35; to remove earlier non-detect and J-flagged data with elevated PQLs for deeper bedrock cobalt data at AW-6, CRL-9, MW-11, MW-14, MW-15, MW-22, MW-33 MW-36, MW-102B, MW-105B, and MW-107B; and to remove earlier non-detect and J-flagged data with elevated PQLs for the deeper bedrock nickel data at AW-6, CRL-9, MW-14, MW-15, MW-18, MW-19, MW-22, MW-33, and MW-36 due to the increased uncertainty the elevated PQLs added. IDNR approved the downgradient cobalt dataset adjustments due to elevated PQLs in the letters

dated May 12, 2016 and November 20, 2017 (IDNR, 2016 and 2017). These data set adjustments were maintained in the current statistical evaluation.

5.1.2 Adjustments Due to Sampling Technique Changes

As noted in Section 3.1, the downgradient metals data sets continued to be reviewed on a case-by-case basis to determine whether data set adjustments are recommended based on the change in sampling technique from high-volume to low-flow sampling methods. In the letter dated November 20, 2017 (IDNR, 2017), IDNR concurred with the strategy to analyze wells on a case-by-case basis for a statistical correlation between newer and older sampling techniques.

No data set adjustments are currently recommended for the SSIs listed in Tables 6 through 9 and the corrective action constituents in Table 3. To date, downgradient data set adjustments include removal of the high-volume August 2008 through September 2014 zinc data at AW-7, MW-20, and MW-30 and removal of the high-volume August 2008 through September 2014 nickel data at MW-13. IDNR approved the zinc and nickel data set adjustments in the letter dated November 20, 2017 (IDNR, 2017). These data set adjustments were maintained in the current statistical evaluation.

5.1.3 Adjustments Due to Exiting Corrective Action

As further detailed in Attachment 1, the historical data prior to when statistical compliance with the GWPS was first achieved will be removed when analyte/well pairs exit corrective action and return to assessment constituents. Nickel in MW-12; cobalt, nickel, and vinyl chloride in MW-13; cobalt in MW-23; and arsenic in VP-3 exited corrective action and returned to assessment constituents during the Fall 2019 or Spring 2020 statistical evaluations. Cobalt in AW-5 and MW-17 exited corrective action and returned to assessment constituents during the Fall 2020 statistical evaluation. Arsenic in MW-20 exited corrective action and returned to an assessment constituent during the Fall 2023 statistical evaluation. Compliance with the GWPS was first achieved in Spring 2015 for nickel in MW-12 and vinyl chloride in MW-13; in Fall 2016 for cobalt and nickel in MW-13 and cobalt in MW-23; in Spring 2017 for arsenic in VP-3; in Fall 2017 for cobalt in AW-5 and MW-17; and in Spring 2020 for arsenic in MW-20. The historical data prior to these initial compliance dates have been removed. In addition, cobalt in MW-35 exited corrective action and returned to an assessment constituent in 2025. Compliance with the GWPS was first achieved in Fall 2022 for cobalt in MW-35; therefore the historical data prior to Fall 2022 was removed during this statistical evaluation.

The following data set adjustments currently and previously recommended and incorporated due to exiting corrective action include:

- Removal of the Sep. 2010 through March 2017 cobalt data in AW-5. Note that earlier non-detect cobalt data had already been removed as discussed in Section 5.1.1.
- Removal of the Aug. 2008 through Sep. 2014 nickel data in MW-12.
- Removal of the Sep. 2009 through Mar. 2016 cobalt data in MW-13.
- Removal of the Mar. 2015 through Mar. 2016 nickel data in MW-13. Note that nickel data prior to Mar. 2015 had already been removed as discussed in Section 5.1.2.
- Removal of the Aug. 2008 through Sep. 2014 vinyl chloride data in MW-13.
- Removal of the Sep. 2009 through March 2017 cobalt data in MW-17. Note that earlier non-detect cobalt data had already been removed as discussed in Section 5.1.1.
- Removal of the Aug. 2008 through Aug. 2019 arsenic data in MW-20.
- Removal of the Sep. 2010 through Mar. 2016 cobalt data in MW-23. Note that earlier non-detect cobalt data had already been removed as discussed in Section 5.1.1.

- Removal of the Aug. 2008 through Aug. 2016 arsenic data in VP-3.
- Removal of the Aug. 2008 through Aug. 2021 cobalt data in MW-35.

5.2 Background as the Cobalt GWPS

Background cobalt concentrations in the upper bedrock data set exceeded the 567 IAC Chapter 137 Statewide Standard. Therefore, pursuant to 567 IAC 113.10(6)h, the GWPS for cobalt becomes background. The GWPS for cobalt in corrective action monitoring was evaluated with the statistical methods described in Attachment 1 and as recommended in the Unified Guidance (USEPA, 2009). Both the prediction limit (i.e., *two-sample*) and confidence interval (i.e., *one-sample*) methods were evaluated. Where concentration shifts were detected in the data, the *one-sample* confidence interval method was evaluated utilizing the linear trend line approach further detailed in Section 5.3 below. With background as the GWPS, the upper confidence limit is compared to the background upper tolerance limit with 95% confidence and 95% coverage (discussed in detail in Attachment 1).

Note that in March 2025, no SSIs were identified for cobalt in the upper bedrock monitoring locations, and none of the upper bedrock corrective action monitoring locations sampled had cobalt as a corrective action constituent. Therefore, comparisons to the GWPS were not conducted for cobalt in the upper bedrock during this statistical evaluation.

5.3 Data Concentration Shifts During Corrective Action

Statistically significant decreasing linear trends continued to be identified for arsenic in MW-12 (since 2008) and MW-17 (since 2018), and for cobalt in MW-109B (since 2017). In addition, a statistically significant decreasing linear trend was newly identified for thallium in MW-109B (since 2017). Consistent with previous memos, 90% confidence bands (upper 95% confidence limits) placed around the linear trend line were used since significantly decreasing linear trends were identified for these well/analyte pairs.

Regression statistics and confidence band outputs for these analyte/well pairs are provided in Attachment 5. The upper 95% confidence limits were above the GWPS for arsenic in MW-12 and MW-17, cobalt in MW-109B, and thallium in MW-109B.

5.4 SSL Summary

Confidence interval output for the upper and deeper bedrock assessment constituents is included in Attachment 4, and for the upper and deeper bedrock corrective action constituents is included in Attachment 5. The results for the upper bedrock are summarized in Table 10 and the results for the deeper bedrock are summarized in Table 11.

Table 10
Upper Bedrock SSL Summary
Aug. 2008 – Mar. 2025 Appendix II Data

Chemical Name	Wells with SSL [1]	SSL Not Identified or Rejected [1]	GWPS [2]
Corrective Action Monitoring Locations - Assessment Constituents			
1,1-Dichloroethane (ug/L)		MW-12	140
1,2-Dichlorobenzene (ug/L)		MW-13	600
1,4-Dichlorobenzene (ug/L)		MW-12, MW-13, MW-16, MW-32	75
Barium (mg/L)		MW-12, MW-13, MW-32	2
Benzene (ug/L)		MW-13	5
Chlorobenzene (ug/L)		MW-12, MW-13, MW-16, MW-32	100
cis-1,2-Dichloroethene (ug/L)		MW-12	70
Nickel (mg/L)		MW-32	0.1
Corrective Action Monitoring Locations – Corrective Action Constituents			
Arsenic (mg/L)	MW-12, MW-13, MW-16, MW-17, MW-32		0.01

[1] Under the assessment null hypothesis, an SSL is indicated when the lower confidence limit exceeds the GWPS. Under corrective action null hypothesis, an SSL remains when the upper confidence limit exceeds the GWPS.
[2] Values are the 40 CFR Part 141 Safe Drinking Water Act MCL or the 567 IAC Chapter 137 Statewide Standard for a Protected Groundwater Source.

Table 11
Deeper Bedrock SSL Summary
Aug. 2008 – Mar. 2025 Appendix II Data

Chemical Name	Wells with SSL [1]	SSL Not Identified or Rejected [1]	GWPS [2]
Delineation Monitoring Locations – Assessment Constituents			
1,4-Dichlorobenzene (ug/L)		MW-109B	75
Barium (mg/L)		MW-109B	2
Chlorobenzene (ug/L)		MW-109B	100
Nickel (mg/L)		MW-109B	0.1
Corrective Action Monitoring Locations – Assessment Constituents			
1,1-Dichloroethane (ug/L)		MW-14	140
1,2-Dichlorobenzene (ug/L)		MW-14	600
1,4-Dichlorobenzene (ug/L)		MW-14, MW-33	75
Barium (mg/L)		MW-14, MW-33	2
Benzene (ug/L)		MW-14	5
Chlorobenzene (ug/L)		MW-14, MW-33	100
Cobalt (mg/L)		MW-33	0.0021
Nickel (mg/L)		MW-14	0.1
Zinc (mg/L)		MW-14	2
Corrective & Delineation Action Monitoring Locations – Corrective Action Constituents			
Arsenic (mg/L)	MW-14, MW-33, MW-109B		0.01
Cobalt (mg/L)	MW-109B		0.0021
Thallium (mg/L)	MW-109B		0.002

[1] Under the assessment null hypothesis, an SSL is indicated when the lower confidence limit exceeds the GWPS. Under corrective action null hypothesis, an SSL remains when the upper confidence limit exceeds the GWPS.
[2] Values are the 40 CFR Part 141 Safe Drinking Water Act MCL or the 567 IAC Chapter 137 Statewide Standard for a Protected Groundwater Source.

5.5 Summary of Comparison to Groundwater Protection Standard

5.5.1 Delineation Monitoring Locations

No SSLs were identified for the assessment constituents in deeper bedrock delineation monitoring location MW-109B. Arsenic, cobalt, and thallium in MW-109B were evaluated as corrective action constituents. SSLs continued to be identified for these analyte/well pairs; therefore, compliance with the GWPS has not been achieved. Note that statistically significant decreasing trends were identified for cobalt and thallium in MW-109B.

5.5.2 Corrective Action Monitoring Locations

No SSLs were identified for the assessment constituents in the upper and deeper bedrock corrective action monitoring locations.

For the upper bedrock corrective action constituents, SSLs over the GWPS remained for arsenic in MW-12, MW-13, MW-16, MW-17, and MW-32. While compliance with the GWPS was not achieved, statistically significant decreasing trends were identified for arsenic in MW-12 and MW-17.

For the deeper bedrock corrective action constituents, SSLs continued to be identified for arsenic in MW-14 and MW-33.

6 Conclusions

The methodology described in Attachment 1 was utilized to conduct the statistical evaluations for the upper and deeper bedrock locations in the delineation and corrective action monitoring programs.

In March 2024, semiannual corrective action, background, and delineation monitoring were conducted at upper bedrock monitoring locations MW-12, MW-13, MW-16, MW-17, MW-32, MW-37, and MW-101A and deeper bedrock monitoring locations MW-14, MW-33, MW-38, MW-101B, and MW-109B. In accordance with Permit Amendment #16, annual monitoring at upper bedrock monitoring wells AW-1, AW-2, AW-3, AW-4, AW-5, MW-20, MW-21, MW-23, MW-24, MW-26, MW-28, MW-30, MW-34, MW-35, VP-3, VP-4, MW-105A, MW-106A, MW-107A, and MW-109A and deeper bedrock wells AW-6, CRL-9, MW-11, MW-15, MW-18, MW-19, MW-22, MW-25, MW-31, MW-36, MW-102B, MW-104B, MW-105B, MW-107B, and MW-108B is scheduled for Fall 2025. Therefore, these locations were not monitored in March 2025.

6.1 Upper Bedrock Monitoring Locations

A summary of the Spring 2025 statistical evaluation results for the upper bedrock system is presented in Table 12.

Table 12
Summary of the Spring 2025 Evaluation - Upper Bedrock

Monitoring Location	Monitoring Program	Current Schedule [1,2] (Mar. 2025)	Current SSIs	Corrective Action Constituents		Retesting Parameter	Monitoring Program Changes
				Current SSLs [3]	Achieved Compliance with GWPS		
Downgradient Monitoring Locations							
MW-12	Corrective Action	Appendix II	1,1-Dichloroethane; 1,4-Dichlorobenzene; Barium; Chlorobenzene; cis-1,2-Dichloroethene	Arsenic			
MW-13	Corrective Action	Appendix II	1,2-Dichlorobenzene; 1,4-Dichlorobenzene; Barium; Benzene; Chlorobenzene	Arsenic			
MW-16	Corrective Action	Appendix II	1,4-Dichlorobenzene; Chlorobenzene	Arsenic			
MW-17	Corrective Action	Appendix II		Arsenic			
MW-32	Corrective Action	Appendix II	1,4-Dichlorobenzene; Barium; Chlorobenzene; Nickel	Arsenic			
Background Monitoring Locations							
MW-37	Background	Appendix II					
MW-101A	Background	Appendix II					

(1) In accordance with Permit Amendment #16, annual monitoring at AW-1, AW-2, AW-3, AW-4, AW-5, MW-20, MW-21, MW-23, MW-24, MW-26, MW-28, MW-30, MW-34, MW-35, VP-3, VP-4, MW-105A, MW-106A, MW-107A, and MW-109A is scheduled for Fall 2025. Therefore, these locations were not monitored in Mar. 2025.

(2) Appendix II locations were sampled for the Appendix I and detected Appendix II constituents in Mar. 2025. Resampling for the full Appendix II list at the corrective action and background monitoring wells is conducted every five years.

(3) Analyte/well pairs with SSLs over the GWPS identified during previous statistical evaluations and have not achieved compliance with the GWPS for 3 consecutive years in accordance with 567 IAC 113.10(9)e(2).

6.1.1 Corrective Action Monitoring

In March 2025, semiannual corrective action monitoring for the Appendix I and detected Appendix II constituents was conducted at MW-12, MW-13, MW-16, MW-17, and MW-32. The SSIs identified for the assessment constituents in the upper bedrock corrective action monitoring locations are summarized in Table 12. No SSLs were identified for the assessment constituents in the upper bedrock corrective action monitoring locations.

Confidence intervals in corrective action mode or 90% confidence bands around linear trend lines were utilized to evaluate arsenic in MW-12, MW-13, MW-16, MW-17, and MW-32 (i.e., the corrective action constituents in these locations). As shown in Table 12, SSLs remained for arsenic in MW-12, MW-13, MW-16, MW-17, and MW-32. While compliance with the GWPS was not achieved, statistically significant decreasing trends were identified for arsenic in MW-12 and MW-17.

In accordance with Permit Amendment #6. the next five-year resampling for the full Appendix II list will be conducted at the corrective action monitoring locations in Fall 2025.

6.1.2 Background Monitoring

Semiannual background monitoring for the Appendix I and detected Appendix II constituents was conducted at MW-37 and MW-101A in March 2025. The next five-year resampling for the full Appendix II list will be conducted at the background monitoring locations in Fall 2025.

6.2 Deeper Bedrock Monitoring Locations

A summary of the Spring 2025 statistical evaluation results for the deeper bedrock system is presented in Table 13.

Table 13
Summary of the Spring 2025 Evaluation - Deeper Bedrock

Monitoring Location	Monitoring Program	Current Schedule [1,2] (Mar. 2025)	Current SSIs	Corrective Action Constituents		Retesting Parameter	Monitoring Program Changes
				Current SSLs [3]	Achieved Compliance with GWPS		
Downgradient Monitoring Locations							
MW-14	Corrective Action	Appendix II	1,1-Dichloroethane; 1,2-Dichlorobenzene; 1,4-Dichlorobenzene; Barium; Benzene; Chlorobenzene; Nickel; Zinc	Arsenic			
MW-33	Corrective Action	Appendix II	1,4-Dichlorobenzene; Barium; Chlorobenzene; Cobalt	Arsenic		Lead [4]	
Background Monitoring Locations							
MW-38	Background	Appendix II					
MW-101B	Background	Appendix II					
Delineation Monitoring Locations							
MW-109B	Delineation	Appendix I	1,4-Dichlorobenzene; Barium; Chlorobenzene; Nickel	Arsenic; Cobalt; Thallium			

[1] In accordance with Permit Amendment #16, annual monitoring at AW-6, CRL-9, MW-11, MW-15, MW-18, MW-19, MW-22, MW-25, MW-31, MW-36, MW-102B, MW-104B, MW-105B, MW-107B, and MW-108B is scheduled for Fall 2025. Therefore, these locations were not monitored in Mar. 2025.

[2] Appendix II locations were sampled for the Appendix I and detected Appendix II constituents in Mar. 20245. Resampling for the full Appendix II list at the corrective action and background monitoring wells is conducted every five years.

[3] Analyte/well pairs with SSLs over the GWPS identified during previous statistical evaluations and have not achieved compliance with the GWPS for three consecutive years in accordance with 567 IAC 113.10(9)e(2).

[4] MW-33 will be resampled for lead prior to the next semiannual event due to rejection during data validation.

6.2.1 Delineation Monitoring

In March 2025, semiannual delineation monitoring for the Appendix I list was conducted at MW-109B. The SSIs identified for the assessment constituents in MW-109B are summarized in Table 13. No SSLs were identified for the assessment constituents in deeper bedrock delineation monitoring location MW-109B.

Confidence intervals in corrective action mode or 90% confidence bands around linear trend lines were utilized to evaluate arsenic, cobalt, and thallium in MW-109B (i.e., the corrective action constituents in MW-109B). SSLs continued to be identified for these analyte/well pairs; therefore, compliance with the GWPS has not been achieved. While compliance with the GWPS was not achieved, a statistically significant decreasing trend was identified for cobalt and thallium in MW-109B.

Semiannual delineation monitoring for the Appendix I constituents will be conducted at MW-109B in Fall 2025. In Fall 2025, annual delineation monitoring will be conducted at MW-102B, MW-105B, and MW-107B for the Appendix I list, at MW-104B for arsenic, and at MW-108B for the Appendix I list without cobalt.

6.2.2 Corrective Action Monitoring

In March 2025, semiannual corrective action monitoring for the Appendix I and detected Appendix II constituents was conducted at MW-14 and MW-33. As noted in Section 2, the March 2025 lead result at MW-33 was rejected during data validation; therefore, lead in MW-33 was not evaluated in this statistical evaluation. The SSIs identified for the assessment constituents in the deeper bedrock corrective action monitoring locations are summarized in Table 13. No SSLs were identified for the assessment constituents in the deeper bedrock corrective action monitoring locations.

Confidence intervals in corrective action mode were utilized to evaluate arsenic in MW-14 and MW-33 (i.e., the corrective action constituents in these locations). As shown in Table 13, SSLs remained for arsenic in MW-14 and MW-33.

As noted in Section 2, lead in MW-33 was rejected during data analysis and recommended for resampling. Therefore, lead in MW-33 will be sampled prior to the next semiannual event. In accordance with Permit Amendment #6, the next five-year resampling for the full Appendix II list will be conducted at the corrective action monitoring locations in Fall 2025.

6.2.3 Background Monitoring

Semiannual background monitoring for the Appendix I and detected Appendix II constituents was conducted at MW-38 and MW-101B in March 2025. The next five-year resampling for the full Appendix II list will be conducted at the background monitoring locations in Fall 2025.

Attachment 1
Detailed Discussion of Statistical Methods

Foth

Memorandum

Statistical Methodology

1. Comparison to Background

For determining which parameters will need a formal statistical treatment, the Unified Guidance (USEPA, 2009) suggests splitting monitoring parameters into three distinct groups: a) reliable indicators selected for formal testing; b) other analytes which are monitored for general groundwater quality information but not statistically tested; and c) those meeting the "never-detected" criteria. Only those parameters with some historically detected presence in background need to be included in the first group and treated with a formal statistical test. Any parameter that has never been detected in background is eligible for the third group of "never-detected" constituents. Constituents with detections below the reporting limit (J-flagged data) will be considered "never-detected." As a means of evaluating the third group, the Unified Guidance suggests the Double Quantification Rule (DQR). The DQR is stated in the Unified Guidance as:

"A confirmed exceedance is registered if any well-constituent pair in the '100% non-detect' group exhibits quantified measurements [i.e., at or above the reporting limit (RL)] in two consecutive sample and resample events."

The Unified Guidance also recommends establishing background sample sizes as large as feasible. The guidance recognizes that small sample sizes in background can be "particularly" troublesome, especially in controlling statistical test false positive and negative rates. With parametric tests (such as parametric prediction limits), the false positive rate may be controlled, but at the expense of statistical power. With non-parametric tests (such as non-parametric prediction limits or the "quasi-statistical" DQR), the false positive rate may be unacceptably high. The Unified Guidance suggests that generally at least 8 to 10 separate background measurements be available, recognizing that statistical power continues to increase with larger sample sizes.

In reports prior to the *2011 Annual Water Quality Report* (Foth, 2012), the ANOVA and a "2x2 contingency table" methods were used to evaluate statistically significant increases (SSIs) over background. These methods met the criteria of 567 Iowa Administrative Code (IAC) 113.10(4)g and h. The ANOVA and "2x2 contingency table" methods were used to maximize the statistical power while minimizing potentially large false positive rates as a result of the smaller sample sizes.

Starting with the *2011 Annual Water Quality Report* (Foth, 2012), the statistical analysis methods utilized for comparison to background were the DQR and "1-of-3" interwell prediction limits as recommended in the Unified Guidance (USEPA, 2009). Note that a "1-of-2" retesting plan was not selected as it would have resulted in a 'low' effective statistical power level for the site based on USEPA reference power curves as defined in the Unified Guidance.

Starting with the Spring 2021 statistical evaluation, the interwell prediction limit retesting plan was modified to a "1-of-2" plan. With increases in the number of background samples, a "1-of-2" plan was able to achieve a 'good' effective statistical power level for the site based on the USEPA reference power curves.

Expansion of the Background Data Set

The background data set was modified in 2013 to add MW-101A and MW-101B to the upper bedrock and deeper bedrock background data sets, respectively. The statistical analysis methods continued the DQR and "1-of-2" interwell prediction limits as recommended in the Unified Guidance (USEPA, 2009), utilizing the pooled data from MW-37 and MW-101A for the upper bedrock system and MW-38 and MW-101B for the deeper bedrock system.

Double Quantification Rule

The DQR will be used to evaluate SSIs over background for the Appendix I and II constituents that were not detected above the reporting limit in the background data sets. An SSI will be indicated for any well-constituent pair with quantified measurements at or above the reporting limit noted for two consecutive sample and resample events. If applicable, the resample will be collected prior to next semiannual sampling event.

Interwell Prediction Limits

Interwell prediction limits will be used to statistically evaluate SSIs over background for the Appendix I and II constituents which have been detected above the reporting limit in the background data set. A "1-of-2" retesting plan will be utilized on individual sample results. The 1-of-2 retesting plan as defined in the Unified Guidance concludes that an SSI has occurred when two out of two sample results exceed the prediction limit, while no SSI is concluded if 1-of-2 are below the limit. If applicable, the resample will be collected prior to next semiannual sampling event. The prediction limit for each constituent will be recalculated semiannually.

For interwell constituents with less than or equal to 50% detects in the background data set, a non-parametric prediction limit will be utilized. The non-parametric prediction limit will be taken as the maximum order statistic (maximum value) of the background data.

For interwell constituents with greater than 50% detects in the background data set, normality assumptions will be verified using the Shapiro-Wilk normality test. If the background data is not normally distributed, a non-parametric prediction limit will be utilized (as described in the paragraph above). If the background data is normally distributed or can be fit to a normal distribution utilizing a normalizing transformation, then a normal-based parametric prediction limit will be applied.

When considering a lognormal prediction limit, a comparison will be made to the maximum order statistic for the background data set. Lognormal prediction limits can be sensitive to smaller departures from lognormality. That is, if data are not truly lognormal, but also not rejected as lognormal, the prediction limit may be inflated because of the transformation. In choosing a lognormal limit, in addition to the percent detections and lognormal goodness of fit criteria, an additional convention will be applied. If the lognormal limit exceeds the level of twice the maximum background concentration, it is assumed that the lognormal model does not adequately fit the background distribution and a non-parametric prediction limit will be selected.

For interwell constituents with 50% to 85% detects in the background data set, Kaplan-Meier estimation will be applied to manage statistical bias introduced by non-detects. For interwell constituents with over 85% detects in the background data set, half the reporting limit will be used for non-detect data. These estimation methods follow Unified Guidance recommendations and are given in detail in Unified Guidance Chapter 15 (USEPA, 2009).

The parametric prediction limit will be calculated as:

$$PL = \bar{x} + k \cdot s$$

where $\bar{x}$ is the sample mean of the August 2008 through current event background data, *s* is the sample standard deviation, and *k* is the multiplier obtained from the Unified Guidance Table 19-1 (USEPA, 2009) for 1-of-2 interwell prediction limits on observations. In determining *k*, the number of constituents of concern (COCs) for formal statistical evaluation along with the number of downgradient wells need to be identified. Per the basic subdivision discussion presented in Section 19.2.1 of the Unified Guidance, along with the discussion regarding the use of the appendix tables for parametric retesting plans given on pages 19-13 through 19-15 of the Unified Guidance (USEPA, 2009), the *k*-multiplier is chosen based on the number of constituents, wells, and evaluations performed annually. When an exact well and COC configuration is not given in the appendix tables, the *k*-multiplier is linearly interpolated as described on page 19-14 of the Unified Guidance (USEPA, 2009).

Sanitas® v10.0. software (Sanitas Technologies) will be used to check distributional assumptions, perform Kaplan-Meier in the case of 50% to 85% detects in the background data set, and calculate the *k*-multipliers and subsequent prediction limits.

Intrawell Prediction Limits

Intrawell prediction limits are calculated in a similar manner to that described above for the interwell case. A main difference between the two methods is the intrawell limit is calculated from a collection of background measurements within the compliance well. A minimum of eight compliance well background samples will be used when calculating the limit.

A second difference is for the parametric prediction limit, in which the *k*-multiplier is modified from the interwell case, as given in Appendix D Tables 19-10 through 19-18 of the Unified Guidance (USEPA, 2009).

Updating intrawell background is performed periodically. The Unified Guidance (Section 5.3.2) recommends that 4 to 8 new compliance observations be collected prior to updating the background dataset. The guidance also states that "a potential update is predicated on there being no statistically significant increase [SSI] recorded for that well constituent, including since the last update." A two-sample t-test or Wilcoxon rank-sum test between existing intrawell background data and the potential set of newer background data is performed, and a non-significant result (α = 0.05) implies that the newer compliance data can be re-classified as background measurements.

For Wilcoxon rank-sum tests, non-detect results cannot be ranked with certainty and the problem is compounded with multiple PQLs and/or J-flagged values (USEPA, 2009). In comparisons where a substantial fraction of non-detect and/or J-flagged measurements or changing PQLs occur, professional judgment will be utilized for evaluating significant differences between the existing intrawell background data and the potential newer set of background data. Consideration will be given to whether significant differences are due to artificial variation introduced by censored data.

2. Comparison to Groundwater Protection Standard – Assessment Monitoring

According to 567 IAC 113.10(6)f and g, under the assessment monitoring program Appendix II results which have been determined to be statistically above background are also statistically compared to the GWPS. If "Appendix II constituents are detected at statistically significant levels above the GWPS" a notice is placed in the operating record and characterization is begun.

Under 567 IAC 113.10(6)h, the GWPS is the maximum contaminant level (MCL) promulgated under Section 1412 of the Safe Drinking Water Act in 40 Code of Federal Regulations (CFR) Part 141. If no MCL exists, or if background concentrations are higher than the MCL, the GWPS is defined as background. Also, per 567 IAC 113.10(6)i, an alternative GWPS may be established by the department for constituents for which there is no MCL such as the "health-based concentrations that comply with the statewide standards for groundwater established pursuant to 567 IAC Chapter 137."

When the GWPS is background concentrations, the statistical methods discussed in the above "1. Comparison to Background" are used. When the GWPS is the MCL or an alternative health-based concentration, per the Unified Guidance (USEPA, 2009), "confidence intervals are the recommended general statistical strategy in compliance/assessment or corrective action monitoring." In the case of normally distributed data, a normal-based parametric confidence interval is used. If the data are not normally distributed a non-parametric confidence interval on the median is used. A lower 99% confidence limit falling above the GWPS implies that concentrations are detected at statistically significant levels above the GWPS with an α-level of 0.01, which is the minimum RCRA regulatory limit from §264.97(i)(2) for an individual test false positive error rate.

The Unified Guidance recognizes that statistical power is also of prime concern to USEPA and that there "should be a high probability that the statistical test will positively identify concentrations that have exceeded a fixed regulatory standard." In compliance/assessment monitoring, instead of pre-specifying the false positive rate prior to computing confidence interval limits, the Unified Guidance suggests the desired level of power (1-β) should be set as an initial target.

For compliance/assessment monitoring purposes, the Unified Guidance (Chapter 22) suggests evaluating increases in the true concentration mean of 1.5 and 2.0 times a fixed standard. (This is similar in concept to the critical power targets in detection monitoring, i.e., 55-60% power at 3σ above background and 80-85% power at 4σ over background). As a general guide, the Unified Guidance suggests there should be at least 70-80% statistical power for detecting increases of 2 times a fixed standard. Specifically, the Unified Guidance recommends there be 50% power of detecting increases in the true concentration mean of 1.5 times a fixed standard (risk ratio of 1.5) and 80% power of detecting increases in the true concentration mean of 2.0 times a fixed standard (risk ratio of 2.0).

To meet these levels of statistical power, α is chosen based on either Unified Guidance Equation 22.1:

$$1 - \beta = G_{T,n-1}\left(t_{1-\alpha,n-1}\middle|\Delta - \sqrt{n}(R-1)\right);$$

where R is the desired risk ratio, $t_{(1-\alpha,n-1)}$ is the $(1-\alpha)$ Student's t-quantile with ($n-1$) degrees of freedom and *G* represents the cumulative non-central t-distribution with ($n-1$) degrees of freedom and noncentrality parameter Δ;

or Unified Guidance Equation 22.2:

$$\alpha \sim 1 - F_{T,n-1}\left(\frac{(R-1)\sqrt{n}}{R \cdot \widehat{CV}} - t_{1-\beta,n-1}\right);$$

where R is the desired risk ratio, n is the sample size, CV is the estimated sample coefficient of variation, $t_{(1-\beta,n-1)}$ is the $(1-\beta)$ Student's t-quantile with (n−1) degrees of freedom, and *F* is the cumulative (central) Student's t-distribution function.

The first equation (Unified Guidance Equation 22.1) assumes a coefficient of variation (CV) =1. This version is used if only poorer estimates of the true CV are available. In practice, a convention has been adopted with the statistical updates to utilize Unified Guidance Equation 22.2 in all cases where a parametric confidence interval is calculated and use Unified Guidance Equation 22.1 when non-parametric confidence intervals are calculated. Since a non-parametric confidence interval is based on the median, it is not as sensitive to departures from normality, and the assumption of a CV=1 in Unified Guidance Equation 22.1 should provide a conservative estimate.

Since 0.01 is the minimum RCRA regulatory limit for α, it is never set lower than this. Conversely, the Unified Guidance recognizes the "difficulty of simultaneously attaining the recommended level of power while controlling the false positive rate, especially for small sample sizes and highly variable data." The Unified Guidance suggests a maximum false positive rate of α=0.2 is a reasonable upper bound.

Finally, like the need for defining a SWFPR under detection monitoring, the Unified Guidance (Chapter 7) recognizes there may be concern about the "use of relatively high individual test-wise false positive rates (α) in order to meet a pre-specified power, especially when considering the cumulative false positive error rate across multiple wells and/or constituents." However, "the Unified Guidance considers computation of cumulative SWFPRs in compliance/assessment testing to be problematic, and reliance on individual test false positive rates preferable." Notwithstanding, if several confidence limit calculations are compared to the GWPS with high α-levels, caution should be taken in the interpretation.

For calculation of confidence intervals, Sanitas® v10.0 software is again used to check distributional assumptions, perform Kaplan-Meier estimation in the case of 50% to 85% detects, and calculate either parametric or nonparametric confidence limits.

3. Comparison to Groundwater Protection Standard – Corrective Action Monitoring

As stated above, if "Appendix II constituents are detected at statistically significant levels above the GWPS" a notice is placed in the operating record and characterization is begun. Owners or operators are required to initiate an assessment of corrective measures, select a remedy, and implement a remedy in accordance with 567 IAC 113.10(7), (8), and (9). For remedy completion in accordance with 567 IAC 113.10(9)e(2), compliance with the GWPS is considered achieved by demonstrating that concentrations of Appendix II constituents have not exceeded the GWPS

for a period of three consecutive years or an alternate length of time established by the Department.

Starting with the Fall 2019 statistical evaluation, individual analyte/well pairs may return to assessment constituents (at the corrective action monitoring location) once compliance with the GWPS has been achieved for a period of 3 years. Note that monitoring wells will not move out of the corrective action monitoring program until all Appendix II constituents have achieved compliance with the GWPS for a period of three consecutive years.

Confidence Intervals in Corrective Action Mode

In the case of the GWPS being a fixed standard as either the 40 CFR Part 141 Safe Drinking Water Act MCL or the 567 IAC Chapter 137 Statewide Standard for a Protected Groundwater Source, "confidence intervals are the recommended general statistical strategy in compliance/assessment or corrective action monitoring" (USEPA, 2009). However, a primary difference between confidence intervals as used under assessment monitoring and confidence intervals used under corrective action is reversal of the null hypothesis. As detailed in Section 7.2 of the Unified Guidance (USEPA, 2009), the hypothesis testing structure under assessment monitoring is to presume compliance point concentrations do not to exceed the fixed standard unless sampling data indicates otherwise. As a formal statistical hypothesis, this is written as:

$$H_0: \Theta \leq G \quad \text{vs.} \quad H_A: \Theta > G$$

In corrective action mode, the hypothesis is reversed. Namely, compliance point concentrations are presumed to exceed the fixed standard and evidence must be presented to demonstrate regulatory compliance. In the case of corrective action, the statistical hypothesis is written as:

$$H_0: \Theta > G \quad \text{vs.} \quad H_A: \Theta \leq G$$

For testing under assessment monitoring, a lower confidence limit (LCL) is compared to the compliance standard *G*. If the LCL is larger than the standard *G*, it is concluded that the compliance standard has been violated.

However, under corrective action monitoring, the upper confidence limit (UCL) is compared to the compliance standard G. In this case, the UCL should lie below the standard to accept the alternative hypothesis that concentration levels are in compliance.

The UCL α-level under corrective action monitoring is set so that a high degree of confidence is achieved in declaring successful remediation. Per the Unified Guidance (Section 7.4.2) "USEPA's overriding concern in corrective action is that remediation efforts are not declared successful without sufficient statistical proof." The Unified Guidance "recommends the use of a reasonably low, fixed test-wide false positive rate (e.g., α = 0.05 or 0.10)." In this case, α = 0.10 corresponds to a 90% UCL.

GWPS as Background

Pursuant to 567 IAC 113.10(6)h, when background concentrations of an analyte exceed the applicable MCL or 567 IAC Statewide Standard for a Protected Groundwater Source, the GWPS is the background concentration. In this case, the GWPS is not a fixed standard but based on a distribution of background sample results.

Section 7.5 of the Unified Guidance (USEPA, 2009) details statistical hypothesis testing under corrective action when the GWPS is background. The Unified Guidance offers two alternative statistical approaches to hypothesis testing in this case. These alternatives are as follows:

A. The first represents a *two-sample* test of two distinct populations, namely the compliance well to background populations. Similar to the statistical tests used under detection and assessment monitoring, with this alternative under corrective action, the Unified Guidance states that "one highly recommended statistical test approach is a prediction limit." The Unified Guidance also states, "whatever the critical value for a selected background test, it becomes the GWPS under compliance/assessment or corrective action monitoring." Further, "the only allowable hypothesis test structure for the two-sample approach follows that of detection and compliance monitoring. Once exceeded and in corrective action, a return to compliance is through evidence that future samples lie below the GWPS using the same hypothesis structure." Therefore, with this approach in corrective action, prediction limits are calculated similarly as in assessment monitoring. Compliance well concentrations below a prediction limit indicate a return to concentrations below the background GWPS.

B. The second involves computation of a fixed statistic from the background data as the GWPS. The Unified Guidance recommendation in this case is to define a fixed GWPS based on a background upper tolerance limit with 95% confidence and 95% coverage. This is designed to be a "reasonable maximum on the likely range of background concentrations." This upper tolerance limit based on background data is then used as a fixed standard in statistical comparisons with 90% or 95% UCLs from compliance wells as discussed previously. Also, with the UCL method, the null hypothesis is reversed from that of assessment monitoring, assuming contamination is above the GWPS. A UCL falling below the background GWPS offers evidence of a return to concentrations below the GWPS. The Unified Guidance refers to this approach as a *single-sample* testing method, since the compliance well population is tested against a defined fixed standard.

The Unified Guidance discusses tradeoffs between the two approaches and does not necessarily prescribe either approach over the other. The Unified Guidance suggests that both approaches may be used, where "the background GWPS would be a range based on the two testing methods rather than a single value."

Normality

For calculation of confidence intervals, Sanitas® v10.0 software is again used to check distributional assumptions, perform Kaplan-Meier estimation in the case of 50% to 85% detects, and calculate either parametric or nonparametric confidence limits. "Corrective Action Mode" is selected for this analysis.

Non-Corrective Action Constituents

As recommended in the Unified Guidance (USEPA, 2009), confidence intervals in corrective action mode will be utilized to evaluate only constituents and monitoring locations with previously identified SSLs over the GWPS. Other compliance constituents (i.e., those without SSLs over the GWPS during prior statistical evaluations) will continue to be evaluated using the "1. Comparison to Background" and "2. Comparison to Groundwater Protection Standard – Assessment Monitoring" methods described above.

Note: The Unified Guidance (USEPA, 2009) states: “it should be recognized that once corrective action or remediation activities are initiated, there will be a considerable time during which the GWPS may still be exceeded. As provided in the RCRA regulations, it is at the conclusion of remediation activities that formal corrective action monitoring evaluation is appropriate. However, in the intervening period of remedial activity, well constituents can still be monitored, and the relative efficacy of remediation measures tracked. The same corrective action hypothesis can be assumed for the targeted constituents; techniques such as trend testing may be appropriate interim applications.” Given the statement above and the intentions of 567 IAC 113.10(6)g, as soon as an SSL is identified for an assessment monitoring constituent/location, then the next statistical evaluation will utilize corrective action monitoring (confidence intervals in corrective action mode).

Data Concentration Shifts During Corrective Action

Confidence intervals assume that the population is stable over time. As a result, confidence intervals may not accurately represent the current well concentrations if increasing or decreasing trends are observed (i.e., during a release or under active remediation). Per the Unified Guidance (USEPA, 2009), lower or upper confidence limits constructed on accumulated data may be overly wide (due to high sample variability caused by combining pre- and post-shift data) and may not be reflective of more recent upward/downward shifts in the contaminant distribution.

Alternative procedures may be applied to data sets with shifting distributions. For example, where trends tests are significant, pre-shift data may be removed from the well/parameter data set for the purposes of constructing the confidence interval. “The reduction in sample size will often be more than offset by the gain in statistical power. More recent measurements may exhibit less variation around the shifted mean value, resulting in a shorter confidence interval” (USEPA, 2009).

Another alternative is to construct confidence bands around the trend line to track progress towards exceeding or meeting a fixed standard. As suggested in the Unified Guidance (Chapter 22), if a trend is present, a 90% confidence band (upper 95% confidence limit) is placed on the linear trend line. If the upper 95% confidence limit on the trend line falls below the GWPS, the well is found to have reduced to levels statistically below the GWPS.

As the discussed in the Unified Guidance, “inferences concerning a linear regression are generally appropriate when two conditions hold: 1) the residuals from the regression are approximately normal or at least reasonably symmetric in distribution; and 2) a plot of residuals versus concentrations indicates a scatter cloud of essentially uniform vertical thickness or width.” These conditions are assessed through normal probability plots of the regression residuals and plots of residuals against the predicted concentrations.

Data Adjustments Due to Exiting Corrective Action

When analyte/well pairs exit corrective action and return to assessment constituents, the hypothesis testing structure is reversed again. In corrective action mode, compliance point concentrations were presumed to exceed the GWPS, and evidence must be presented to demonstrated regulatory compliance (i.e., UCLs below the GWPS for three consecutive years). With the return to assessment constituents, analyte/well pairs have demonstrated regulatory compliance. The hypothesis testing structure reverts to the assessment monitoring structure where compliance point concentrations are presumed to not exceed the GWPS unless sampling

data indicates otherwise (i.e., LCL is above the GWPS). With this reversion in hypothesis, the focus shifts to evaluating concentration changes in the analyte/well pair that would indicate an increase over the GWPS and re-trigger corrective action. For constituents with historical SSLs, earlier concentrations that had previously triggered corrective action are no longer providing useful information regarding the current assessment monitoring hypothesis. Retaining the historical data during the timeframe in which the GWPS was exceeded will result in the regression or confidence interval methods being slower to respond to new increases. As a result, the historical data prior to when statistical compliance with the GWPS was first achieved will be removed when analyte/well pairs exit corrective action and return to assessment constituents.

[1] Under assessment mode, an SSL is indicated when the lower confidence limit exceeds the groundwater protection standard (compliance limit).

[2] Value is the 40 CFR Part 141 Safe Drinking Water Act MCL or the IAC 567 Chapter 137 Statewide Standard for a Protected Groundwater Source.

[3] For parametric confidence intervals: Except where otherwise indicated, based on Unified Guidance Equation 22.2, i.e., $\alpha \sim 1 - F_{T,n-1}\left(\frac{(R-1)\sqrt{n}}{R \cdot CV} - t_{1-\beta,n-1}\right)$

where R is the desired risk ratio, n is the sample size, CV is the estimated sample coefficient of variation, $t_{1\text{-}b,n\text{-}1}$ is the (1−b) Student's t-quantile with (n−1) degrees of freedom, and F is the cumulative (central) Student's t-distribution function.

[4] For non-parametric confidence intervals: Based on Unified Guidance Equation 22.1, i.e., $1 - \beta = G_{T,n-1}\left(t_{1-\alpha,n-1} \middle| \Delta = \sqrt{n}(R-1)\right)$

where R is the desired risk ratio, $t_{1\text{-}a,n\text{-}1}$ is the (1−a) Student's t-quantile with (n−1) degrees of freedom and G represents the cumulative non-central t-distribution with (n−1) degrees of freedom and noncentrality parameter D.

[1] Under assessment mode, an SSL is indicated when the lower confidence limit exceeds the groundwater protection standard (compliance limit).

[2] Value is the 40 CFR Part 141 Safe Drinking Water Act MCL or the IAC 567 Chapter 137 Statewide Standard for a Protected Groundwater Source.

[3] For parametric confidence intervals: Except where otherwise indicated, based on Unified Guidance Equation 22.2, i.e., $\alpha \sim 1 - F_{T,n-1}\left(\frac{(R-1)\sqrt{n}}{R \cdot \widehat{CV}} - t_{1-\beta,n-1}\right)$

where R is the desired risk ratio, n is the sample size, CV is the estimated sample coefficient of variation, $t_{1-b,n-1}$ is the (1–b) Student's t-quantile with (n–1) degrees of freedom, and F is the cumulative (central) Student's t-distribution function.

[4] For non-parametric confidence intervals: Based on Unified Guidance Equation 22.1, i.e., $\hat{\alpha}, \hat{\beta} = G_{T,n-1}(t_{1-\alpha,n-1} | \Delta = \sqrt{n}(R-1))$

where R is the desired risk ratio, $t_{1-a,n-1}$ is the (1–a) Student's t-quantile with (n–1) degrees of freedom and G represents the cumulative non-central t-distribution with (n–1) degrees of freedom and noncentrality parameter D.

RE: Site 1 Statistical Analysis - Summer 2025 Evaluation

1 Memorandum Organization

This memo addresses the statistical analysis of the groundwater monitoring data collected in June 2025. The statistical methods and results are summarized, with the memo organization given as follows:

Page
1 Memorandum Organization 1
2 Background 1
3 Statistical Methodology 1
4 Comparison to Background Levels 2
4.1 Double Quantification Rule 2
5 Conclusions 2

Attachment 1 Detailed Discussion of Statistical Methods
Attachment 2 Sanitas Report Output for Double Quantification Rule Evaluations
Attachment 3 References

2 Background

In June 2025, a resample was collected for lead and total suspended solids (TSS) in MW-33 since the March 2025 lead result was rejected during data validation. The analytical result for the resample will be provided in Table 14 of the 2025 Annual Water Quality Report (AWQR).

Under the detection monitoring program of 567 IAC 113.10(5), Appendix I monitoring results are statistically compared to background levels as given in 567 IAC 113.10(6)e. Based on the August 2008 through June 2025 results, this memo presents an evaluation of statistically significant increases (SSIs) under the requirements of paragraphs 113.10(4)g and h of 567 IAC.

3 Statistical Methodology

The statistical method utilized for evaluating the resample result was consistent with the methods used in previous statistical evaluations. Detailed descriptions of the statistical methods are provided in Attachment 1. Sanitas® v10.0 (Sanitas Technologies) software was utilized to complete the statistical comparison.

4 Comparison to Background Levels

4.1 Double Quantification Rule

The Double Quantification Rule (DQR) was used to evaluate an SSI over background for lead in MW-33. The DQR output is included in Attachment 2. A single DQR was not identified for the June 2025 lead result; therefore, an SSI was not declared for lead in MW-33.

5 Conclusions

In June 2025, a resample was collected for lead and total suspended solids (TSS) in MW-33 since the March 2025 lead result was rejected during data validation. The methodology described in Attachment 1 was utilized to conduct the statistical evaluation for the resample collected at MW-33. An SSI was not identified for lead in MW-33. MW-33 will continue semiannual corrective action monitoring for the Appendix I and detected Appendix II constituents in Fall 2025.

Attachment 1
Detailed Discussion of Statistical Methods

Foth

Memorandum

Statistical Methodology

1. Comparison to Background

For determining which parameters will need a formal statistical treatment, the Unified Guidance (USEPA, 2009) suggests splitting monitoring parameters into three distinct groups: a) reliable indicators selected for formal testing; b) other analytes which are monitored for general groundwater quality information but not statistically tested; and c) those meeting the "never-detected" criteria. Only those parameters with some historically detected presence in background need to be included in the first group and treated with a formal statistical test. Any parameter that has never been detected in background is eligible for the third group of "never-detected" constituents. Constituents with detections below the reporting limit (J-flagged data) will be considered "never-detected." As a means of evaluating the third group, the Unified Guidance suggests the Double Quantification Rule (DQR). The DQR is stated in the Unified Guidance as:

"A confirmed exceedance is registered if any well-constituent pair in the '100% non-detect' group exhibits quantified measurements [i.e., at or above the reporting limit (RL)] in two consecutive sample and resample events."

The Unified Guidance also recommends establishing background sample sizes as large as feasible. The guidance recognizes that small sample sizes in background can be "particularly" troublesome, especially in controlling statistical test false positive and negative rates. With parametric tests (such as parametric prediction limits), the false positive rate may be controlled, but at the expense of statistical power. With non-parametric tests (such as non-parametric prediction limits or the "quasi-statistical" DQR), the false positive rate may be unacceptably high. The Unified Guidance suggests that generally at least 8 to 10 separate background measurements be available, recognizing that statistical power continues to increase with larger sample sizes.

In reports prior to the *2011 Annual Water Quality Report* (Foth, 2012), the ANOVA and a "2x2 contingency table" methods were used to evaluate statistically significant increases (SSIs) over background. These methods met the criteria of 567 Iowa Administrative Code (IAC) 113.10(4)g and h. The ANOVA and "2x2 contingency table" methods were used to maximize the statistical power while minimizing potentially large false positive rates as a result of the smaller sample sizes.

Starting with the *2011 Annual Water Quality Report* (Foth, 2012), the statistical analysis methods utilized for comparison to background were the DQR and "1-of-3" interwell prediction limits as recommended in the Unified Guidance (USEPA, 2009). Note that a "1-of-2" retesting plan was not selected as it would have resulted in a 'low' effective statistical power level for the site based on USEPA reference power curves as defined in the Unified Guidance.

Starting with the Spring 2021 statistical evaluation, the interwell prediction limit retesting plan was modified to a "1-of-2" plan. With increases in the number of background samples, a "1-of-2" plan was able to achieve a 'good' effective statistical power level for the site based on the USEPA reference power curves.

Expansion of the Background Data Set

The background data set was modified in 2013 to add MW-101A and MW-101B to the upper bedrock and deeper bedrock background data sets, respectively. The statistical analysis methods continued the DQR and "1-of-2" interwell prediction limits as recommended in the Unified Guidance (USEPA, 2009), utilizing the pooled data from MW-37 and MW-101A for the upper bedrock system and MW-38 and MW-101B for the deeper bedrock system.

Double Quantification Rule

The DQR will be used to evaluate SSIs over background for the Appendix I and II constituents that were not detected above the reporting limit in the background data sets. An SSI will be indicated for any well-constituent pair with quantified measurements at or above the reporting limit noted for two consecutive sample and resample events. If applicable, the resample will be collected prior to next semiannual sampling event.

Interwell Prediction Limits

Interwell prediction limits will be used to statistically evaluate SSIs over background for the Appendix I and II constituents which have been detected above the reporting limit in the background data set. A "1-of-2" retesting plan will be utilized on individual sample results. The 1-of-2 retesting plan as defined in the Unified Guidance concludes that an SSI has occurred when two out of two sample results exceed the prediction limit, while no SSI is concluded if 1-of-2 are below the limit. If applicable, the resample will be collected prior to next semiannual sampling event. The prediction limit for each constituent will be recalculated semiannually.

For interwell constituents with less than or equal to 50% detects in the background data set, a non-parametric prediction limit will be utilized. The non-parametric prediction limit will be taken as the maximum order statistic (maximum value) of the background data.

For interwell constituents with greater than 50% detects in the background data set, normality assumptions will be verified using the Shapiro-Wilk normality test. If the background data is not normally distributed, a non-parametric prediction limit will be utilized (as described in the paragraph above). If the background data is normally distributed or can be fit to a normal distribution utilizing a normalizing transformation, then a normal-based parametric prediction limit will be applied.

When considering a lognormal prediction limit, a comparison will be made to the maximum order statistic for the background data set. Lognormal prediction limits can be sensitive to smaller departures from lognormality. That is, if data are not truly lognormal, but also not rejected as lognormal, the prediction limit may be inflated because of the transformation. In choosing a lognormal limit, in addition to the percent detections and lognormal goodness of fit criteria, an additional convention will be applied. If the lognormal limit exceeds the level of twice the maximum background concentration, it is assumed that the lognormal model does not adequately fit the background distribution and a non-parametric prediction limit will be selected.

For interwell constituents with 50% to 85% detects in the background data set, Kaplan-Meier estimation will be applied to manage statistical bias introduced by non-detects. For interwell constituents with over 85% detects in the background data set, half the reporting limit will be used for non-detect data. These estimation methods follow Unified Guidance recommendations and are given in detail in Unified Guidance Chapter 15 (USEPA, 2009).

The parametric prediction limit will be calculated as:

$$PL = \bar{x} + k \cdot s$$

where $\bar{x}$ is the sample mean of the August 2008 through current event background data, *s* is the sample standard deviation, and *k* is the multiplier obtained from the Unified Guidance Table 19-1 (USEPA, 2009) for 1-of-2 interwell prediction limits on observations. In determining *k*, the number of constituents of concern (COCs) for formal statistical evaluation along with the number of downgradient wells need to be identified. Per the basic subdivision discussion presented in Section 19.2.1 of the Unified Guidance, along with the discussion regarding the use of the appendix tables for parametric retesting plans given on pages 19-13 through 19-15 of the Unified Guidance (USEPA, 2009), the *k*-multiplier is chosen based on the number of constituents, wells, and evaluations performed annually. When an exact well and COC configuration is not given in the appendix tables, the *k*-multiplier is linearly interpolated as described on page 19-14 of the Unified Guidance (USEPA, 2009).

Sanitas® v10.0. software (Sanitas Technologies) will be used to check distributional assumptions, perform Kaplan-Meier in the case of 50% to 85% detects in the background data set, and calculate the *k*-multipliers and subsequent prediction limits.

Intrawell Prediction Limits

Intrawell prediction limits are calculated in a similar manner to that described above for the interwell case. A main difference between the two methods is the intrawell limit is calculated from a collection of background measurements within the compliance well. A minimum of eight compliance well background samples will be used when calculating the limit.

A second difference is for the parametric prediction limit, in which the *k*-multiplier is modified from the interwell case, as given in Appendix D Tables 19-10 through 19-18 of the Unified Guidance (USEPA, 2009).

Updating intrawell background is performed periodically. The Unified Guidance (Section 5.3.2) recommends that 4 to 8 new compliance observations be collected prior to updating the background dataset. The guidance also states that "a potential update is predicated on there being no statistically significant increase [SSI] recorded for that well constituent, including since the last update." A two-sample t-test or Wilcoxon rank-sum test between existing intrawell background data and the potential set of newer background data is performed, and a non-significant result (α = 0.05) implies that the newer compliance data can be re-classified as background measurements.

For Wilcoxon rank-sum tests, non-detect results cannot be ranked with certainty and the problem is compounded with multiple PQLs and/or J-flagged values (USEPA, 2009). In comparisons where a substantial fraction of non-detect and/or J-flagged measurements or changing PQLs occur, professional judgment will be utilized for evaluating significant differences between the existing intrawell background data and the potential newer set of background data. Consideration will be given to whether significant differences are due to artificial variation introduced by censored data.

2. Comparison to Groundwater Protection Standard – Assessment Monitoring

According to 567 IAC 113.10(6)f and g, under the assessment monitoring program Appendix II results which have been determined to be statistically above background are also statistically compared to the GWPS. If "Appendix II constituents are detected at statistically significant levels above the GWPS" a notice is placed in the operating record and characterization is begun.

Under 567 IAC 113.10(6)h, the GWPS is the maximum contaminant level (MCL) promulgated under Section 1412 of the Safe Drinking Water Act in 40 Code of Federal Regulations (CFR) Part 141. If no MCL exists, or if background concentrations are higher than the MCL, the GWPS is defined as background. Also, per 567 IAC 113.10(6)i, an alternative GWPS may be established by the department for constituents for which there is no MCL such as the "health-based concentrations that comply with the statewide standards for groundwater established pursuant to 567 IAC Chapter 137."

When the GWPS is background concentrations, the statistical methods discussed in the above "1. Comparison to Background" are used. When the GWPS is the MCL or an alternative health-based concentration, per the Unified Guidance (USEPA, 2009), "confidence intervals are the recommended general statistical strategy in compliance/assessment or corrective action monitoring." In the case of normally distributed data, a normal-based parametric confidence interval is used. If the data are not normally distributed a non-parametric confidence interval on the median is used. A lower 99% confidence limit falling above the GWPS implies that concentrations are detected at statistically significant levels above the GWPS with an α-level of 0.01, which is the minimum RCRA regulatory limit from §264.97(i)(2) for an individual test false positive error rate.

The Unified Guidance recognizes that statistical power is also of prime concern to USEPA and that there "should be a high probability that the statistical test will positively identify concentrations that have exceeded a fixed regulatory standard." In compliance/assessment monitoring, instead of pre-specifying the false positive rate prior to computing confidence interval limits, the Unified Guidance suggests the desired level of power (1-β) should be set as an initial target.

For compliance/assessment monitoring purposes, the Unified Guidance (Chapter 22) suggests evaluating increases in the true concentration mean of 1.5 and 2.0 times a fixed standard. (This is similar in concept to the critical power targets in detection monitoring, i.e., 55-60% power at 3σ above background and 80-85% power at 4σ over background). As a general guide, the Unified Guidance suggests there should be at least 70-80% statistical power for detecting increases of 2 times a fixed standard. Specifically, the Unified Guidance recommends there be 50% power of detecting increases in the true concentration mean of 1.5 times a fixed standard (risk ratio of 1.5) and 80% power of detecting increases in the true concentration mean of 2.0 times a fixed standard (risk ratio of 2.0).

To meet these levels of statistical power, α is chosen based on either Unified Guidance Equation 22.1:

$$1 - \beta = G_{T,n-1}\left(t_{1-\alpha,n-1}\middle|\Delta - \sqrt{n}(R-1)\right);$$

where R is the desired risk ratio, $t_{(1-\alpha,n-1)}$ is the $(1-\alpha)$ Student's t-quantile with ($n-1$) degrees of freedom and *G* represents the cumulative non-central t-distribution with ($n-1$) degrees of freedom and noncentrality parameter Δ;

or Unified Guidance Equation 22.2:

$$\alpha \sim 1 - F_{T,n-1}\left(\frac{(R-1)\sqrt{n}}{R \cdot \widehat{CV}} - t_{1-\beta,n-1}\right);$$

where R is the desired risk ratio, n is the sample size, CV is the estimated sample coefficient of variation, $t_{(1-\beta,n-1)}$ is the $(1-\beta)$ Student's t-quantile with (n−1) degrees of freedom, and *F* is the cumulative (central) Student's t-distribution function.

The first equation (Unified Guidance Equation 22.1) assumes a coefficient of variation (CV) =1. This version is used if only poorer estimates of the true CV are available. In practice, a convention has been adopted with the statistical updates to utilize Unified Guidance Equation 22.2 in all cases where a parametric confidence interval is calculated and use Unified Guidance Equation 22.1 when non-parametric confidence intervals are calculated. Since a non-parametric confidence interval is based on the median, it is not as sensitive to departures from normality, and the assumption of a CV=1 in Unified Guidance Equation 22.1 should provide a conservative estimate.

Since 0.01 is the minimum RCRA regulatory limit for α, it is never set lower than this. Conversely, the Unified Guidance recognizes the "difficulty of simultaneously attaining the recommended level of power while controlling the false positive rate, especially for small sample sizes and highly variable data." The Unified Guidance suggests a maximum false positive rate of α=0.2 is a reasonable upper bound.

Finally, like the need for defining a SWFPR under detection monitoring, the Unified Guidance (Chapter 7) recognizes there may be concern about the "use of relatively high individual test-wise false positive rates (α) in order to meet a pre-specified power, especially when considering the cumulative false positive error rate across multiple wells and/or constituents." However, "the Unified Guidance considers computation of cumulative SWFPRs in compliance/assessment testing to be problematic, and reliance on individual test false positive rates preferable." Notwithstanding, if several confidence limit calculations are compared to the GWPS with high α-levels, caution should be taken in the interpretation.

For calculation of confidence intervals, Sanitas® v10.0 software is again used to check distributional assumptions, perform Kaplan-Meier estimation in the case of 50% to 85% detects, and calculate either parametric or nonparametric confidence limits.

3. Comparison to Groundwater Protection Standard – Corrective Action Monitoring

As stated above, if "Appendix II constituents are detected at statistically significant levels above the GWPS" a notice is placed in the operating record and characterization is begun. Owners or operators are required to initiate an assessment of corrective measures, select a remedy, and implement a remedy in accordance with 567 IAC 113.10(7), (8), and (9). For remedy completion in accordance with 567 IAC 113.10(9)e(2), compliance with the GWPS is considered achieved by demonstrating that concentrations of Appendix II constituents have not exceeded the GWPS

for a period of three consecutive years or an alternate length of time established by the Department.

Starting with the Fall 2019 statistical evaluation, individual analyte/well pairs may return to assessment constituents (at the corrective action monitoring location) once compliance with the GWPS has been achieved for a period of 3 years. Note that monitoring wells will not move out of the corrective action monitoring program until all Appendix II constituents have achieved compliance with the GWPS for a period of three consecutive years.

Confidence Intervals in Corrective Action Mode

In the case of the GWPS being a fixed standard as either the 40 CFR Part 141 Safe Drinking Water Act MCL or the 567 IAC Chapter 137 Statewide Standard for a Protected Groundwater Source, "confidence intervals are the recommended general statistical strategy in compliance/assessment or corrective action monitoring" (USEPA, 2009). However, a primary difference between confidence intervals as used under assessment monitoring and confidence intervals used under corrective action is reversal of the null hypothesis. As detailed in Section 7.2 of the Unified Guidance (USEPA, 2009), the hypothesis testing structure under assessment monitoring is to presume compliance point concentrations do not to exceed the fixed standard unless sampling data indicates otherwise. As a formal statistical hypothesis, this is written as:

$$H_0: \Theta \leq G \quad \text{vs.} \quad H_A: \Theta > G$$

In corrective action mode, the hypothesis is reversed. Namely, compliance point concentrations are presumed to exceed the fixed standard and evidence must be presented to demonstrate regulatory compliance. In the case of corrective action, the statistical hypothesis is written as:

$$H_0: \Theta > G \quad \text{vs.} \quad H_A: \Theta \leq G$$

For testing under assessment monitoring, a lower confidence limit (LCL) is compared to the compliance standard *G*. If the LCL is larger than the standard *G*, it is concluded that the compliance standard has been violated.

However, under corrective action monitoring, the upper confidence limit (UCL) is compared to the compliance standard G. In this case, the UCL should lie below the standard to accept the alternative hypothesis that concentration levels are in compliance.

The UCL α-level under corrective action monitoring is set so that a high degree of confidence is achieved in declaring successful remediation. Per the Unified Guidance (Section 7.4.2) "USEPA's overriding concern in corrective action is that remediation efforts are not declared successful without sufficient statistical proof." The Unified Guidance "recommends the use of a reasonably low, fixed test-wide false positive rate (e.g., α = 0.05 or 0.10)." In this case, α = 0.10 corresponds to a 90% UCL.

GWPS as Background

Pursuant to 567 IAC 113.10(6)h, when background concentrations of an analyte exceed the applicable MCL or 567 IAC Statewide Standard for a Protected Groundwater Source, the GWPS is the background concentration. In this case, the GWPS is not a fixed standard but based on a distribution of background sample results.

Section 7.5 of the Unified Guidance (USEPA, 2009) details statistical hypothesis testing under corrective action when the GWPS is background. The Unified Guidance offers two alternative statistical approaches to hypothesis testing in this case. These alternatives are as follows:

A. The first represents a *two-sample* test of two distinct populations, namely the compliance well to background populations. Similar to the statistical tests used under detection and assessment monitoring, with this alternative under corrective action, the Unified Guidance states that "one highly recommended statistical test approach is a prediction limit." The Unified Guidance also states, "whatever the critical value for a selected background test, it becomes the GWPS under compliance/assessment or corrective action monitoring." Further, "the only allowable hypothesis test structure for the two-sample approach follows that of detection and compliance monitoring. Once exceeded and in corrective action, a return to compliance is through evidence that future samples lie below the GWPS using the same hypothesis structure." Therefore, with this approach in corrective action, prediction limits are calculated similarly as in assessment monitoring. Compliance well concentrations below a prediction limit indicate a return to concentrations below the background GWPS.

B. The second involves computation of a fixed statistic from the background data as the GWPS. The Unified Guidance recommendation in this case is to define a fixed GWPS based on a background upper tolerance limit with 95% confidence and 95% coverage. This is designed to be a "reasonable maximum on the likely range of background concentrations." This upper tolerance limit based on background data is then used as a fixed standard in statistical comparisons with 90% or 95% UCLs from compliance wells as discussed previously. Also, with the UCL method, the null hypothesis is reversed from that of assessment monitoring, assuming contamination is above the GWPS. A UCL falling below the background GWPS offers evidence of a return to concentrations below the GWPS. The Unified Guidance refers to this approach as a *single-sample* testing method, since the compliance well population is tested against a defined fixed standard.

The Unified Guidance discusses tradeoffs between the two approaches and does not necessarily prescribe either approach over the other. The Unified Guidance suggests that both approaches may be used, where "the background GWPS would be a range based on the two testing methods rather than a single value."

Normality

For calculation of confidence intervals, Sanitas® v10.0 software is again used to check distributional assumptions, perform Kaplan-Meier estimation in the case of 50% to 85% detects, and calculate either parametric or nonparametric confidence limits. "Corrective Action Mode" is selected for this analysis.

Non-Corrective Action Constituents

As recommended in the Unified Guidance (USEPA, 2009), confidence intervals in corrective action mode will be utilized to evaluate only constituents and monitoring locations with previously identified SSLs over the GWPS. Other compliance constituents (i.e., those without SSLs over the GWPS during prior statistical evaluations) will continue to be evaluated using the "1. Comparison to Background" and "2. Comparison to Groundwater Protection Standard – Assessment Monitoring" methods described above.

Note: The Unified Guidance (USEPA, 2009) states: "it should be recognized that once corrective action or remediation activities are initiated, there will be a considerable time during which the GWPS may still be exceeded. As provided in the RCRA regulations, it is at the conclusion of remediation activities that formal corrective action monitoring evaluation is appropriate. However, in the intervening period of remedial activity, well constituents can still be monitored, and the relative efficacy of remediation measures tracked. The same corrective action hypothesis can be assumed for the targeted constituents; techniques such as trend testing may be appropriate interim applications." Given the statement above and the intentions of 567 IAC 113.10(6)g, as soon as an SSL is identified for an assessment monitoring constituent/location, then the next statistical evaluation will utilize corrective action monitoring (confidence intervals in corrective action mode).

Data Concentration Shifts During Corrective Action

Confidence intervals assume that the population is stable over time. As a result, confidence intervals may not accurately represent the current well concentrations if increasing or decreasing trends are observed (i.e., during a release or under active remediation). Per the Unified Guidance (USEPA, 2009), lower or upper confidence limits constructed on accumulated data may be overly wide (due to high sample variability caused by combining pre- and post-shift data) and may not be reflective of more recent upward/downward shifts in the contaminant distribution.

Alternative procedures may be applied to data sets with shifting distributions. For example, where trends tests are significant, pre-shift data may be removed from the well/parameter data set for the purposes of constructing the confidence interval. "The reduction in sample size will often be more than offset by the gain in statistical power. More recent measurements may exhibit less variation around the shifted mean value, resulting in a shorter confidence interval" (USEPA, 2009).

Another alternative is to construct confidence bands around the trend line to track progress towards exceeding or meeting a fixed standard. As suggested in the Unified Guidance (Chapter 22), if a trend is present, a 90% confidence band (upper 95% confidence limit) is placed on the linear trend line. If the upper 95% confidence limit on the trend line falls below the GWPS, the well is found to have reduced to levels statistically below the GWPS.

As the discussed in the Unified Guidance, "inferences concerning a linear regression are generally appropriate when two conditions hold: 1) the residuals from the regression are approximately normal or at least reasonably symmetric in distribution; and 2) a plot of residuals versus concentrations indicates a scatter cloud of essentially uniform vertical thickness or width." These conditions are assessed through normal probability plots of the regression residuals and plots of residuals against the predicted concentrations.

Data Adjustments Due to Exiting Corrective Action

When analyte/well pairs exit corrective action and return to assessment constituents, the hypothesis testing structure is reversed again. In corrective action mode, compliance point concentrations were presumed to exceed the GWPS, and evidence must be presented to demonstrated regulatory compliance (i.e., UCLs below the GWPS for three consecutive years). With the return to assessment constituents, analyte/well pairs have demonstrated regulatory compliance. The hypothesis testing structure reverts to the assessment monitoring structure where compliance point concentrations are presumed to not exceed the GWPS unless sampling

data indicates otherwise (i.e., LCL is above the GWPS). With this reversion in hypothesis, the focus shifts to evaluating concentration changes in the analyte/well pair that would indicate an increase over the GWPS and re-trigger corrective action. For constituents with historical SSLs, earlier concentrations that had previously triggered corrective action are no longer providing useful information regarding the current assessment monitoring hypothesis. Retaining the historical data during the timeframe in which the GWPS was exceeded will result in the regression or confidence interval methods being slower to respond to new increases. As a result, the historical data prior to when statistical compliance with the GWPS was first achieved will be removed when analyte/well pairs exit corrective action and return to assessment constituents.

N/A = Not applicable. Monitoring points were under routine parameter sampling per 567 IAC 113.2(5) prior to initiation of Appendix II.

[1] Except for MW-26, the five-year resampling for the full Appendix II list was conducted at the assessment, corrective action, and background monitoring locations in Aug. 2025. MW-26 was sampled for Appendix I and detected Appendix II constituents in Aug. 2025.

(2) In accordance with 567 IAC 113.10(9)e(2), cobalt in MW-35 returned to an assessment constituent in 2025 since compliance with the GWPS was maintained for three consecutive years. Since cobalt was the only corrective action constituent in MW-35, MW-35 returned to an assessment monitoring location.
(3) Six rounds of background monitoring for the Appendix II metals were conducted at MW-101A between Sep. 2013 and Mar. 2015. Background monitoring for the full Appendix II list was conducted in Sep. 2015, Mar. 2016, and Aug. 2020.

N/A = Not applicable. Monitoring points were under routine parameter sampling per 567 IAC 113.2(5) prior to initiation of Appendix II.
(1) In accordance with Permit Amendment #6, the five-year resampling for the full Appendix II list was conducted at the assessment and corrective action monitoring locations in Aug.2025. In addition, background wells were sampled for the full Appendix II list in Aug. 2025.
(2) Six rounds of background monitoring for the Appendix II metals were conducted at MW-101B between Sep. 2013 and Mar. 2015. Two rounds of background monitoring for the full Appendix II list were conducted in Sep. 2015 and Mar. 2016.
(3) IDNR approved retaining MW-104B as an arsenic delineation monitoring well in the letter dated May 12, 2016 (IDNR, 2016).
(4) IDNR approved the removal of cobalt from the list of analytes at MW-108B in the letter dated Apr. 16, 2019 (IDNR, 2019).

In August 2025, semiannual corrective action, background, and delineation monitoring were conducted at upper bedrock wells MW-12, MW-13, MW-16, MW-17, MW-32, MW-37, and MW-101A and deeper bedrock wells MW-14, MW-33, MW-38, MW-101B, and MW-109B. In accordance with Permit Amendment #16, annual detection, assessment, corrective action, and delineation monitoring was also conducted in August 2025 at upper bedrock wells AW-1, AW-2, AW-3, AW-4, AW-5, MW-20, MW-21, MW-23, MW-24, MW-26, MW-28, MW-30, MW-34, MW-35, VP-3, VP-4, MW-105A, MW-106A, MW-107A, and MW-109A and deeper bedrock wells AW-6, CRL-9, MW-11, MW-15, MW-18, MW-19, MW-22, MW-25, MW-31, MW-36, MW-102B, MW-104B, MW-105B, MW-107B, and MW-108B. In accordance with Permit Amendment #6, the five-year resampling for the full Appendix II list was conducted at the assessment and corrective action monitoring locations, except for MW-26, in August 2025. In addition, background wells were sampled for the full Appendix II list in August 2025. The next full Appendix II resampling dates will be provided in Table 2 of the 2025 Annual Water Quality Report (AWQR).

As noted in the data validation report, which will be submitted with the 2025 AWQR, the laboratory inadvertently stored the cyanide sample for MW-11 at room temperature; therefore, the August 2025 cyanide result for MW-11 was rejected and not evaluated in this statistical evaluation. Resampling was not recommended since cyanide has not been detected at MW-11 historically.

Under the detection and assessment monitoring programs of 567 IAC 113.10(5) and 113.10(6), Appendix I and II monitoring results are statistically compared to background levels as given in 567 IAC 113.10(6)e and to the groundwater protection standard (GWPS) as given in 567 IAC 113.10(6)g and h. A well may return to detection monitoring when all Appendix II constituents are “shown to be at or below background values, using the statistical procedures in paragraph 113.10(4)g for two consecutive sampling events.” Consequently, to return to detection monitoring in accordance with 567 IAC 113.10(6)e, all Appendix II constituents must be below the interwell prediction limit (for constituents which are detected in the background data set) or below the laboratory reporting limit (for constituents which are not detected in the background data set) during two consecutive sampling events. As mentioned in previous memos, three consecutive sampling events may be utilized to make the determination to return to detection monitoring to limit frequent fluctuation of wells moving between the detection and assessment monitoring programs. Assessment monitoring continues when Appendix II concentrations are above background values but below the GWPS using the statistical procedures in paragraph 113.10(4)g.

If Appendix II constituents are detected at statistically significant levels (SSLs) above the GWPS, characterization [567 IAC 113.10(6)g] is initiated and the owners or operators are required to begin an assessment of corrective measures, select a remedy, and implement a remedy in accordance with 567 IAC 113.10(7), (8), and (9). For remedy completion [567 IAC 113.10(9)e(2)], compliance with the GWPS is considered achieved by demonstrating that concentrations of Appendix II constituents have not exceeded the GWPS for a period of three consecutive years or an alternate length of time established by the IDNR.

Based on the August 2008 through August 2025 results, this memo presents an evaluation of statistically significant increases (SSIs) and SSLs under the requirements of paragraphs 113.10(4)g and h of 567 IAC.

3 Statistical Methodology

The statistical methods utilized for locations in detection, delineation, assessment, and corrective action monitoring were consistent with the methods used in previous statistical evaluations. Detailed descriptions of the statistical methods are provided in Attachment 1. Sanitas® v10.1 (Sanitas Technologies) software was utilized to complete the statistical comparisons.

The combined background data sets (MW-37 and MW-101A for the upper bedrock, and MW-38 and MW-101B for the deeper bedrock) were utilized to evaluate SSIs over background.

3.1 Background Data Set Adjustments

3.1.1 Adjustments Associated with Turbidity and Total Suspended Solids

No background data set adjustments are recommended for MW-37, MW-38, MW-101A, and MW-101B based on review of the field turbidity and total suspended solids (TSS) data from the August 2025 sampling event. The August 2025 TSS concentrations at MW-38, MW-101A, and MW-101B were below the 5 mg/L limit for acceptable sample quality, and the August 2025 TSS concentration of 7.13 mg/L at MW-37 only slightly exceeded the 5 mg/L limit.

The background data set adjustments previously recommended and incorporated based on review of turbidity data include:

- Removal of the high volume September 2009 through September 2014 metals data at MW-101A (initiated with Fall 2016 statistical evaluation).
- Removal of the high volume September 2009 through September 2014 and the initial low-flow March 2015 metals data at MW-101B (initiated with Fall 2016 statistical evaluation).
- Removal of the March 2019 barium concentration in MW-38 due to elevated TSS and the potential for turbidity to contribute to the higher barium concentration identified (initiated with Spring 2019 statistical evaluation).
- Removal of the March 2023 barium, cadmium, cobalt, copper, nickel, selenium, and vanadium concentrations in MW-101A due to elevated TSS and the potential for turbidity to contribute to the higher concentrations identified (initiated with the Spring 2023 statistical evaluation).

These data set adjustments were maintained in the current statistical evaluation. The removed background data will be listed as crossed-out concentrations in Table 14 of the 2025 AWQR.

Note that the historical high-volume data at the downgradient wells continue to be reviewed on a case-by-case basis. The downgradient data set review is discussed in Section 5.1.

3.1.2 Adjustments Associated with Practical Quantitation Limits

Due to lowering of the practical quantitation limits (PQLs), background data set adjustments were approved to remove earlier non-detect data with elevated PQLs for barium, cobalt, copper, and lead in the upper bedrock and for barium, beryllium, cadmium, cobalt, copper, lead, and nickel in the deeper bedrock due to the increased uncertainty the elevated PQLs added. IDNR approved the background dataset adjustments due to elevated PQLs in the letters dated May

12, 2016 and November 20, 2017 (IDNR, 2016 and 2017). These data set adjustments were maintained in the current statistical evaluation.

3.1.3 Review of Single Background Detections

During the September 2015 event, m/p-cresol and phenol were detected above the laboratory reporting limit at upper bedrock background well MW-37. These two constituents have not been detected in either background well prior to or after the September 2015 event. As a result, m/p-cresol and phenol will not be evaluated using prediction limits unless additional background detections are identified. Downgradient m/p-cresol and phenol results will be evaluated using the double quantification rule (DQR).

Single volatile organic compound (VOC) detections were identified for carbon disulfide and toluene in MW-37 in August 2017. In November 2017, retest samples were collected, which did not confirm the November 2017 detections. As a result, it was determined that MW-37 remained suitable as a background well. The only other detections in MW-37 during the August 2017 event were for barium and cobalt. The August 2017 barium and cobalt concentrations were within the range of historical concentrations for these constituents at MW-37. Therefore, the barium and cobalt results were maintained in the background data set for calculating interwell prediction limits. Since VOCs are considered “never detected” constituents, carbon disulfide and toluene were not added as prediction limit constituents. Downgradient carbon disulfide and toluene results continue to be evaluated using the DQR.

Similarly, single VOC detections were identified for benzene, ethylbenzene, toluene, and total xylenes (BTEX) in MW-37 during the Fall 2018 sampling event. The August 2018 detected metals data at MW-37 was removed from the background dataset due to the potential impact indicated by the BTEX detections. A retest sample was collected for BTEX in background well MW-37 in November 2018. The retest results did not confirm the August 2018 BTEX detections; therefore, SSIs were not declared. In addition, the retest results indicated that MW-37 remained suitable for continued use as a background well for the upper bedrock system. Since VOCs are considered “never detected” constituents, the BTEX constituents were not added as prediction limit constituents. Downgradient BTEX results continue to be evaluated using the DQR.

3.2 Corrective Action Constituents

In accordance with the Unified Guidance (USEPA, 2009), corrective action statistics are conducted for analyte/well pairs with previously identified SSLs, as listed in Table 3. No new corrective action constituents were added based on the results of the previous Spring 2025 statistical evaluation. As noted in the Spring 2025 statistical evaluation, cobalt in MW-35 returned to an assessment constituent in 2025 in accordance with 567 IAC 113.10(9)e(2) since compliance with the GWPS was maintained for three consecutive years. Since cobalt was the only corrective action constituent in MW-35, MW-35 returned to an assessment monitoring location.

Under corrective action statistics, comparisons to background are not conducted (except for cobalt in the upper bedrock under the corrective action hypothesis, further discussed in Section 5.2); therefore, the analyte/well pairs listed in Table 3 were not included in the Section 4 comparisons to background.

Table 3
Corrective Action Constituents [1]

Monitoring Location	Corrective Action Constituents [2]
Upper Bedrock Monitoring Locations	
AW-1	Arsenic
AW-2	Arsenic, Thallium
MW-12	Arsenic
MW-13	Arsenic
MW-16	Arsenic
MW-17	Arsenic
MW-20	Thallium
MW-24	Arsenic
MW-30	Arsenic
MW-32	Arsenic
MW-34	Arsenic, Vinyl Chloride
MW-105A	Cobalt
MW-106A	Arsenic, Cobalt
Deeper Bedrock Monitoring Locations	
AW-6	Cobalt
CRL-9	Arsenic, Cobalt
MW-14	Arsenic
MW-22	Arsenic, Cobalt
MW-33	Arsenic
MW-36	Arsenic
MW-105B	Cobalt
MW-109B	Arsenic; Cobalt; Thallium

[1] Table 3 lists the analyte/well pairs identified as corrective action constituents regardless of whether the monitoring location was sampled during the current event.
[2] Corrective action constituents are analyte/well pairs with SSLs over the GWPS identified during previous statistical evaluations and have not achieved compliance with the GWPS in accordance with 567 IAC 113.10(9)e(2).

4 Comparison to Background Levels

Comparisons to background levels were conducted using interwell prediction limits and the DQR. As noted in Section 3.2, comparisons to background were not conducted for the corrective action constituents listed in Table 3.

4.1 Interwell Prediction Limits

Interwell prediction limits were used for formal statistical assessment of SSIs over background for analytes that have been detected above the reporting limit in the combined background data set (MW-37 and MW-101A for the upper bedrock system; MW-38 and MW-101B for the deeper bedrock system). For the upper bedrock, these analytes included antimony, arsenic, barium, cobalt, copper, lead, nickel, tin, and zinc. For the deeper bedrock, these analytes included antimony, arsenic, barium, bis(2-ethylhexyl)phthalate, cadmium, cobalt, copper, nickel, tin, and zinc.

4.1.1 Upper Bedrock

The upper bedrock prediction limits calculated utilizing August 2008 through August 2025 sample data are summarized in Table 4. The background data set adjustments discussed in Section 3.1 were used.

Table 4
Prediction Limit Summary - Upper Bedrock
Aug. 2008 – Aug. 2025 Interwell Data [1]

Chemical Name	Prediction Limit	Units	Prediction Limit Type	Retesting Plan	Prediction Limit Method
Antimony	0.00739	mg/L	Non-Parametric	1-of-2	Maximum Order Statistic
Arsenic	0.00205	mg/L	Non-Parametric	1-of-2	Maximum Order Statistic
Barium	0.1415	mg/L	Parametric (Lognormal)	1-of-2	$\exp(\bar{y} + k \cdot s_y)$
Cobalt	0.008	mg/L	Non-Parametric	1-of-2	Maximum Order Statistic
Copper	0.0225	mg/L	Non-Parametric	1-of-2	Maximum Order Statistic
Lead	0.00695	mg/L	Non-Parametric	1-of-2	Maximum Order Statistic
Nickel	0.0522	mg/L	Non-Parametric	1-of-2	Maximum Order Statistic
Tin [2]	0.152	mg/L	Non-Parametric	1-of-2	Maximum Order Statistic
Zinc	0.0805	mg/L	Non-Parametric	1-of-2	Maximum Order Statistic

[1] Interwell data consists of the Appendix I and II parameters that have been detected in the combined background data set (MW-37 and MW-101A). Note that background data set adjustments were incorporated in accordance with Section 3.1.
[2] Tin was included for the assessment and corrective action monitoring locations, and for delineation wells MW-105A and MW-109A, where tin was analyzed by the lab inadvertently.

Non-parametric prediction limits were used for antimony, arsenic, cobalt, copper, lead, nickel, tin, and zinc since either normality assumptions could not be met or there were less than 50% detects in the combined background data. A parametric lognormal prediction limit was used with barium since there were greater than 50% detects in the combined background data set, the assumptions of normality were met with a lognormal transformation, and the lognormal limit was accepted as being representative of the background distribution.

4.1.2 Deeper Bedrock

Deeper bedrock prediction limits calculated from August 2008 through August 2025 sample data are summarized in Table 5. The background data set adjustments discussed in Section 3.1 were utilized.

Table 5
Prediction Limit Summary - Deeper Bedrock
Aug. 2008 – Aug. 2025 Interwell Data [1]

Chemical Name	Prediction Limit	Units	Prediction Limit Type	Retesting Plan	Prediction Limit Method
Antimony	0.0101	mg/L	Non-Parametric	1-of-2	Maximum Order Statistic
Arsenic	0.00225	mg/L	Non-Parametric	1-of-2	Maximum Order Statistic
Barium	0.138	mg/L	Non-Parametric	1-of-2	Maximum Order Statistic
Bis(2-ethylhexyl) phthalate [2]	25.4	ug/L	Non-Parametric	1-of-2	Maximum Order Statistic
Cadmium	0.000824	mg/L	Non-Parametric	1-of-2	Maximum Order Statistic
Cobalt	0.0008303	mg/L	Parametric (Lognormal with Kaplan-Meier Adjustment)	1-of-2	$\exp(\hat{\mu}_{KM} + k \cdot \hat{\sigma}_{KM})$
Copper	0.0108	mg/L	Non-Parametric	1-of-2	Maximum Order Statistic
Nickel	0.00735	mg/L	Non-Parametric	1-of-2	Maximum Order Statistic
Tin [3]	0.109	mg/L	Non-Parametric	1-of-2	Maximum Order Statistic
Zinc	0.0366	mg/L	Non-Parametric	1-of-2	Maximum Order Statistic

[1] Interwell data consists of the Appendix I and II parameters that have been detected in the combined background data set (MW-38 and MW-101B). Note that background data set adjustments were incorporated in accordance with Section 3.1.
[2] Bis(2-ethylhexyl)phthalate and tin were included only for assessment and corrective action monitoring locations.

[3] Tin was included for the assessment and corrective action monitoring locations, and for delineation wells MW-105B and MW-109B, where tin was analyzed by the lab inadvertently.

Non-parametric prediction limits were used for antimony, arsenic, barium, bis(2-ethylhexyl)phthalate, cadmium, copper, nickel, tin, and zinc since either normality assumptions could not be met or there were less than 50% detects in the combined background data. A parametric lognormal prediction limit was used with cobalt since there were greater than 50% detects in the combined background data set, the assumptions of normality were met with a lognormal transformation, and the lognormal limit was accepted as being representative of the background distribution.

4.1.3 Prediction Limit Exceedances

A summary of the monitoring locations exhibiting a prediction limit exceedance during the August 2025 event is given in Table 6 for the upper bedrock system and Table 7 for the deeper bedrock system. Detailed prediction limit output for each analyte/well pair is included in Attachment 2.

Table 6
Aug. 2025 Prediction Limit Exceedances – Upper Bedrock

Prediction Limit	Arsenic (mg/L) 0.00205	Barium (mg/L) 0.1415	Cobalt (mg/L) 0.008	Copper (mg/L) 0.0225	Nickel (mg/L) 0.0522

4.2 Double Quantification Rule

The DQR was used to evaluate SSIs over background for the remaining Appendix I and II constituents (i.e., constituents which have not been detected above the reporting limit in the combined background data set). The DQR output is included in Attachment 3, with a summary of the August 2025 DQR detections listed in Table 8 for the upper bedrock wells and in Table 9 for the deeper bedrock wells.

4.3 Summary of Comparison to Background

4.3.1 Detection Monitoring Locations

No wells in the upper bedrock system are in detection monitoring. For the deeper bedrock system, no prediction limit exceedances or DQR detections were identified at MW-31.

4.3.2 Delineation Monitoring Locations – Assessment Constituents

For the upper bedrock system, no prediction limit exceedances or DQR detections were identified at MW-105A. Prediction limit exceedances and/or DQR detections were identified at MW-106A, MW-107A, and MW-109A as listed in Tables 6 and 8. In lieu of retesting for the prediction limit exceedances and DQR detection, SSIs were declared and evaluated for SSLs in Section 5.

For the deeper bedrock system, a prediction limit exceedance was not identified for arsenic at MW-104B. Prediction limit exceedances and/or DQR detections were identified at MW-102B, MW-105B, MW-107B, MW-108B, and MW-109B as listed in Tables 7 and 9. In lieu of retesting for the prediction limit exceedances and DQR detections, SSIs were declared and evaluated for SSLs in Section 5.

4.3.3 Assessment Monitoring Locations

For the upper bedrock system, prediction limit exceedances and/or DQR detections were identified at AW-3, AW-4, AW-5, MW-21, MW-23, MW-26, MW-28, MW-35, VP-3, and VP-4 as listed in Tables 6 and 8. For the deeper bedrock system, prediction limit exceedances and/or DQR detections were identified at MW-11, MW-15, MW-18, MW-19, and MW-25 as listed in Tables 7 and 9. In lieu of retesting for the prediction limit exceedances and DQR detections, SSIs were declared and evaluated for SSLs in Section 5, except for methoxychlor in MW-18.

The five-year resampling for the full Appendix II list was conducted at the assessment monitoring locations, except for MW-26, in August 2025. Other than deeper bedrock well MW-18, no new Appendix II constituents were detected at the assessment monitoring locations during the 5-year resampling event. Methoxychlor in MW-18 was newly detected above the PQL. Since methoxychlor was newly detected in MW-18, retesting is recommended. Under the retesting plan, an SSI is not declared until one subsequent resample result confirms the DQR detection. Therefore, a retest sample will be collected for methoxychlor in MW-18 prior to the next semiannual sampling event. If the retest confirms the initial detection identified, consideration will be given to re-establishing baseline (i.e., at least four new quarterly results) prior to conducting a comparison to the GWPS.

4.3.3.1 Exiting Assessment Monitoring

Table 10 presents a summary of the assessment monitoring locations and statistical comparisons required for exiting assessment monitoring. As discussed in Section 1, assessment monitoring locations will return to detection monitoring when Appendix II constituents fall below the current interwell prediction limit (for constituents which are detected in the background data set) and below the laboratory reporting limit (for constituents which are not detected in the background data set) for three consecutive sampling events. In accordance with 567 IAC 113.10(9)e(2), MW-35 returned to an assessment monitoring location. MW-35 will be evaluated to exit assessment monitoring when three samples have been collected in assessment monitoring.

As shown in Table 10, the upper and deeper bedrock assessment monitoring locations have not had all Appendix II constituents below background values for three consecutive sampling events. Therefore, these locations will not exit assessment monitoring at this time.

4.3.4 Corrective Action Monitoring Locations – Assessment Constituents

For the upper bedrock system, no prediction limit exceedances or DQR detections were identified at MW-17. Prediction limit exceedances and/or DQR detections were identified at AW-1, AW-2, MW-12, MW-13, MW-16, MW-20, MW-24, MW-30, MW-32, and MW-34 as listed in Tables 6 and 8, respectively. For the deeper bedrock system, prediction limit exceedances and DQR detections were identified at AW-6, CRL-9, MW-14, MW-22, MW-33, and MW-36 as listed in Tables 7 and 9, respectively. In lieu of retesting for the prediction limit exceedances and DQR detections, SSIs were declared and evaluated for SSLs in Section 5, with the exceptions of m/p-cresol in MW-32 and o-toluidine and sulfide in CRL-9.

The five-year resampling for the full Appendix II list was conducted at the corrective action monitoring locations in August 2025. Except for upper bedrock well MW-32 and deeper bedrock well CRL-9, no new Appendix II constituents were detected at the corrective action monitoring locations during the 5-year resampling event. M/p-cresol in MW-32 and o-toluidine and sulfide in CRL-9 were newly detected above the PQL. Since these analytes were newly detected in MW-32 and CRL-9, retesting is recommended. Under the retesting plan, an SSI is not declared until one subsequent resample result confirms the DQR detections. Therefore, retest samples will be collected for m/p-cresol in MW-32 and o-toluidine and sulfide in CRL-9 prior to the next scheduled sampling event. If the retests confirm the initial detections identified, consideration will be given to re-establishing baseline (i.e., at least four new quarterly results) prior to conducting comparisons to the GWPS.

5 Comparison to Groundwater Protection Standard

Except for m/p-cresol in MW-32, o-toluidine and sulfide in CRL-9, and methoxychlor in MW-18, the prediction limit exceedances and DQR detections listed in Tables 6 through 9 were declared SSIs and evaluated for SSLs over the GWPS per 567 IAC 113.10(6)f and g. Comparisons to the GWPS were evaluated through statistical confidence intervals under the assessment monitoring null hypothesis. SSLs were declared to exist with statistical certainty when the lower confidence

limit exceeds the GWPS. Statistical outputs for confidence intervals in assessment mode are included in Attachment 4.

In contrast, corrective action analyte/well pairs (i.e., those where SSLs have been previously declared) were evaluated to determine compliance with the GWPS per 567 IAC 113.10(9)e. A summary of the upper and deeper bedrock corrective action constituents was provided in Table 3. Comparisons to the GWPS in this case were evaluated through statistical confidence intervals under the corrective action monitoring null hypothesis, or in the case of downward trending data, confidence bands (upper 95% confidence limits) placed around the linear trend line. For corrective action constituents, compliance with the GWPS has been achieved with statistical certainty when the UCL or the upper 95% confidence limit on the trend line is lower than the GWPS for a period of three consecutive years or an alternate length of time established by the IDNR. Statistical outputs for regression statistics, confidence bands, and confidence intervals in corrective action mode are included in Attachment 5.

5.1 Compliance Data Set Review for Confidence Intervals

5.1.1 Adjustments Due to Changes in PQLs

As noted in Section 3.1, downgradient data set adjustments were approved to remove earlier non-detect data with elevated PQLs for upper bedrock cobalt data at AW-5, MW-13, MW-17, MW-23, and MW-35; to remove earlier non-detect and J-flagged data with elevated PQLs for deeper bedrock cobalt data at AW-6, CRL-9, MW-11, MW-14, MW-15, MW-22, MW-33 MW-36, MW-102B, MW-105B, and MW-107B; and to remove earlier non-detect and J-flagged data with elevated PQLs for the deeper bedrock nickel data at AW-6, CRL-9, MW-14, MW-15, MW-18, MW-19, MW-22, MW-33, and MW-36 due to the increased uncertainty the elevated PQLs added. IDNR approved the downgradient cobalt dataset adjustments due to elevated PQLs in the letters dated May 12, 2016 and November 20, 2017 (IDNR, 2016 and 2017). These data set adjustments were maintained in the current statistical evaluation.

5.1.2 Adjustments Due to Sampling Technique Changes

As noted in Section 3.1, the downgradient metals data sets continued to be reviewed on a case-by-case basis to determine whether data set adjustments are recommended based on the change in sampling technique from high-volume to low-flow sampling methods. In the letter dated November 20, 2017 (IDNR, 2017), IDNR concurred with the strategy to analyze wells on a case-by-case basis for a statistical correlation between newer and older sampling techniques.

No data set adjustments are currently recommended for the SSIs listed in Tables 6 through 9 and the corrective action constituents in Table 3. To date, downgradient data set adjustments include removal of the high-volume August 2008 through September 2014 zinc data at AW-7, MW-20, and MW-30 and removal of the high-volume August 2008 through September 2014 nickel data at MW-13. IDNR approved the zinc and nickel data set adjustments in the letter dated November 20, 2017 (IDNR, 2017). These data set adjustments were maintained in the current statistical evaluation.

5.1.3 Adjustments Due to Exiting Corrective Action

As further detailed in Attachment 1, the historical data prior to when statistical compliance with the GWPS was first achieved will be removed when analyte/well pairs exit corrective action and return to assessment constituents. Nickel in MW-12; cobalt, nickel, and vinyl chloride in MW-13; cobalt in MW-23; and arsenic in VP-3 exited corrective action and returned to assessment constituents during the Fall 2019 or Spring 2020 statistical evaluations. Cobalt in AW-5 and MW-

17 exited corrective action and returned to assessment constituents during the Fall 2020 statistical evaluation. Arsenic in MW-20 exited corrective action and returned to an assessment constituent during the Fall 2023 statistical evaluation. Cobalt in MW-35 exited corrective action and returned to an assessment constituent during this Fall 2025 statistical evaluation. Compliance with the GWPS was first achieved in Spring 2015 for nickel in MW-12 and vinyl chloride in MW-13; in Fall 2016 for cobalt and nickel in MW-13 and cobalt in MW-23; in Spring 2017 for arsenic in VP-3; in Fall 2017 for cobalt in AW-5 and MW-17, in Spring 2020 for arsenic in MW-20, and in Fall 2022 for cobalt in MW-35. The historical data prior to these initial compliance dates have been removed.

The following data set adjustments due to exiting corrective action were maintained for Site 1. Note that the decision to return cobalt in MW-35 to assessment monitoring was made in the Fall 2024 statistical evaluation. Since MW-35 is analyzed annually in the Fall, MW-35 returned to assessment monitoring this statistical evaluation; however, the corresponding data was removed during the Spring 2025 statistical evaluation.

- Removal of the Sep. 2010 through March 2017 cobalt data in AW-5. Note that earlier non-detect cobalt data had already been removed as discussed in Section 5.1.1.
- Removal of the Aug. 2008 through Sep. 2014 nickel data in MW-12.
- Removal of the Sep. 2009 through Mar. 2016 cobalt data in MW-13.
- Removal of the Mar. 2015 through Mar. 2016 nickel data in MW-13. Note that nickel data prior to Mar. 2015 had already been removed as discussed in Section 5.1.2.
- Removal of the Aug. 2008 through Sep. 2014 vinyl chloride data in MW-13.
- Removal of the Sep. 2009 through March 2017 cobalt data in MW-17. Note that earlier non-detect cobalt data had already been removed as discussed in Section 5.1.1.
- Removal of the Aug. 2008 through Aug. 2019 arsenic data in MW-20.
- Removal of the Sep. 2010 through Mar. 2016 cobalt data in MW-23. Note that earlier non-detect cobalt data had already been removed as discussed in Section 5.1.1.
- Removal of the Aug. 2008 through Aug. 2016 arsenic data in VP-3.
- Removal of the Aug. 2008 through Aug. 2021 cobalt data in MW-35.

5.2 Background as the Cobalt GWPS

Background cobalt concentrations in the upper bedrock data set exceeded the 567 IAC Chapter 137 Statewide Standard. Therefore, pursuant to 567 IAC 113.10(6)h, the GWPS for cobalt becomes background. The GWPS for cobalt in corrective action monitoring was evaluated with the statistical methods described in Attachment 1 and as recommended in the Unified Guidance (USEPA, 2009). Both the prediction limit (i.e., *two-sample*) and confidence interval (i.e., *one-sample*) methods were evaluated. Where concentration shifts were detected in the data, the *one-sample* confidence interval method was evaluated utilizing the linear trend line approach further detailed in Section 5.3 below. With background as the GWPS, the upper confidence limit is compared to the background upper tolerance limit with 95% confidence and 95% coverage (discussed in detail in Attachment 1).

Statistical outputs for the prediction limit and confidence interval methods with background as the GWPS for cobalt in upper bedrock wells MW-105A and MW-106A are included in Attachment 5. Note that the confidence interval method for cobalt in MW-105A was evaluated as 90% confidence bands placed around the linear trend line due to a statistically significant decreasing trend identified at this location, as further discussed in Section 5.3 below.

5.3 Data Concentration Shifts During Corrective Action

Statistically significant decreasing linear trends continued to be identified for arsenic in AW-1 (since 2008), in MW-12 (since 2008), in MW-17 (since 2018), in MW-24 (since 2012), in MW-30 (since 2008), and in MW-34 (since 2011); cobalt in MW-105A (since 2013) and in MW-109B (since 2017); for thallium in AW-2 (since 2013), MW-20 (since 2012), and MW-109B (since 2017); and for vinyl chloride in MW-34 (since 2008). In addition, statistically significant decreasing linear trends were newly identified for arsenic in MW-13 (since 2019), MW-16 (since 2016), and MW-109B (since 2020) in this Fall 2025 statistical evaluation. Consistent with previous memos, 90% confidence bands (upper 95% confidence limits) placed around the linear trend line were used since significantly decreasing linear trends were identified for these well/analyte pairs.

Conversely, beginning this statistical evaluation, arsenic in MW-106A no longer has a statistically significant decreasing linear trend; therefore, arsenic in MW-106A was evaluated through statistical confidence intervals under the corrective action monitoring null hypothesis.

With confidence bands placed around the linear trend line for upper bedrock cobalt, the GWPS was calculated as the background upper tolerance limit with 95% confidence and 95% coverage. Regression statistics and confidence band outputs for these analyte/well pairs are provided in Attachment 5.

The upper 95% confidence limit remained below the GWPS for cobalt in MW-105A and thallium in MW-20. Conversely, the upper 95% confidence limits were above the GWPS for arsenic in AW-1, MW-12, MW-13, MW-16, MW-17, MW-24, MW-30, MW-34, and MW-109B; for cobalt in MW-109B; for thallium in AW-2 and MW-109B; and for vinyl chloride in MW-34.

5.4 First Order Regression Calculations

Table 11 of the AWQR lists a projected year to completion for each analyte/well pair in corrective action (i.e., those listed in Table 3 of this memo). As initiated with the Fall 2019 statistical evaluation, remedy completion timeframes were estimated for the individual analyte/well pairs in corrective action for inclusion in Table 11 of the 2025 AWQR.

For the corrective action constituents that have achieved compliance with the GWPS (i.e., cobalt in MW-105A and thallium in MW-20), first order regression calculations were not utilized. The projected year to completion is three years after compliance with the GWPS was first statistically achieved and will remain that date as long as concentrations remain statistically below the GWPS during the interim statistical evaluations.

For the remaining corrective constituents (i.e., those that have not achieved compliance with the GWPS), the projected year to completion was based on the first order regression calculations for each individual analyte/well pair. The projected years to completion are three years after the first order regression calculations projected initial compliance with the GWPS. For the corrective action constituents with decreasing trends, the first order regression calculations and projected year to completion are included in the regression statistics output in Attachment 5. The first order regression calculations for the remaining corrective action constituents are included on “Sample Values and Corresponding 1st-Order Regression Calculations for Date to Completion” table in Attachment 5.

5.5 SSL Summary

Confidence interval output for the upper and deeper bedrock assessment constituents is included in Attachment 4, and for the upper and deeper bedrock corrective action constituents is included in Attachment 5. The results for the upper bedrock are summarized in Table 11 and the results for the deeper bedrock are summarized in Table 11.

Table 11
Upper Bedrock SSL Summary
Aug. 2008 – Aug. 2025 Appendix II Data

Chemical Name	Wells with SSL (1)	SSL Not Identified or Rejected (1)	GWPS (2)
Delineation Monitoring Locations - Assessment Constituents			
Barium (mg/L)		MW-106A, MW-107A, MW-109A	2
Selenium (mg/L)		MW-109A	0.05
Assessment Monitoring Locations			
Arsenic (mg/L)		AW-3, AW-4, AW-5, MW-35, VP-3, VP-4	0.01
Barium (mg/L)		AW-5, MW-26, MW-28, MW-35, VP-3	2
Cadmium (mg/L)		AW-4	0.005
Cobalt (mg/L)		AW-4	0.008
Copper (mg/L)		AW-4	1.3
Nickel (mg/L)		AW-4	0.1
Selenium (mg/L)		AW-5	0.05
Silver (mg/L)		AW-4	0.1
Thallium (mg/L)		MW-21, MW-23	0.002
Corrective Action Monitoring Locations - Assessment Constituents			
1,1-Dichloroethane (ug/L)		AW-2, MW-12, MW-16	140
1,2-Dichlorobenzene (ug/L)		MW-12, MW-13, MW-24	600
1,4-Dichlorobenzene (ug/L)		MW-12, MW-13, MW-16, MW-24, MW-32, MW-34	75
Acetone (ug/L)		MW-32, MW-34	
Arsenic (mg/L)		MW-20	0.01
Barium (mg/L)		AW-2, MW-12, MW-13, MW-24, MW-30, MW-32, MW-34	2
Benzene (ug/L)		MW-13, MW-24, MW-30, MW-32, MW-34	5
Chlorobenzene (ug/L)		AW-1, AW-2, MW-12, MW-13, MW-24, MW-32, MW-34	100
Chloroethane (ug/L)		MW-30	2800
cis-1,2-Dichloroethene (ug/L)		AW-2, MW-12, MW-30	70
Nickel (mg/L)		MW-12, MW-24	0.1
Thallium (mg/L)		AW-1, MW-12, MW-24	0.002
Toluene (ug/L)		MW-32, MW-34	100

Table 11 Continued
Upper Bedrock SSL Summary
Aug. 2008 – Aug. 2025 Appendix II Data

Chemical Name	Wells with SSL [1]	SSL Not Identified or Rejected [1]	GWPS [2]
Corrective & Delineation Action Monitoring Locations – Corrective Action Constituents			
Arsenic (mg/L)	AW-1, AW-2, MW-12, MW-13, MW-16, MW-17, MW-24, MW-30, MW-32, MW-34, MW-106A		0.01
Cobalt (mg/L)	MW-106A (Both Methods)	MW-105A (Both Methods)	0.008 [3]
Thallium (mg/L)	AW-2	MW-20	0.002
Vinyl Chloride (ug/L)	MW-34		2

[1] Under the assessment null hypothesis, an SSL is indicated when the lower confidence limit exceeds the GWPS. Under corrective action null hypothesis, an SSL remains when the upper confidence limit exceeds the GWPS.
[2] Values are the 40 CFR Part 141 Safe Drinking Water Act MCL or the 567 IAC Chapter 137 Statewide Standard for a Protected Groundwater Source.
[3] GWPS for cobalt is background. The hypothesis was evaluated through the both the two-sample prediction limit method (GWPS = 0.008 mg/L) and the *one-sample* confidence limit method where the fixed GWPS was based on the background upper tolerance limit with 95% confidence and 95% coverage (GWPS = 0.008 mg/L).

Table 12 Continued
Deeper Bedrock SSL Summary
Aug. 2008 – Aug. 2025 Appendix II Data

Chemical Name	Wells with SSL [1]	SSL Not Identified or Rejected [1]	GWPS [2]
Corrective & Delineation Action Monitoring Locations – Corrective Action Constituents			
Arsenic (mg/L)	CRL-9, MW-14, MW-22, MW-33, MW-36, MW-109B		0.01
Cobalt (mg/L)	AW-6, CRL-9, MW-22, MW-105B, MW-109B		0.0021
Thallium (mg/L)	MW-109B		0.002

[1] Under the assessment null hypothesis, an SSL is indicated when the lower confidence limit exceeds the GWPS. Under corrective action null hypothesis, an SSL remains when the upper confidence limit exceeds the GWPS.
[2] Values are the 40 CFR Part 141 Safe Drinking Water Act MCL or the 567 IAC Chapter 137 Statewide Standard for a Protected Groundwater Source.

5.6 Summary of Comparison to Groundwater Protection Standard

5.6.1 Delineation Monitoring Locations

No SSLs were identified for the assessment constituents in the upper bedrock delineation monitoring locations. Cobalt in MW-105A and arsenic and cobalt in MW-106A were evaluated as corrective action constituents. Compliance with the GWPS was achieved for cobalt in MW-105A starting with the Fall 2024 statistical evaluation and remained during the current statistical evaluation. In accordance with IAC 113.10(9)e(2), cobalt in MW-105A will return to an assessment constituent in 2027 if the constituent/well pair remains below the GWPS in the interim statistical evaluations. SSLs continued to be identified for arsenic and cobalt in MW-106A; therefore, compliance with the GWPS has not been achieved. In previous evaluations, a statistically decreasing trend was identified for arsenic in MW-106A. However, in this statistical evaluation, arsenic in MW-106A no longer has a statistically significant decreasing trend; therefore, arsenic in MW-106A was evaluated through statistical confidence intervals under the corrective action monitoring null hypothesis.

No SSLs were identified for the assessment constituents in the deeper bedrock delineation monitoring locations. Cobalt in MW-105B and arsenic, cobalt, and thallium in MW-109B were evaluated as corrective action constituents. SSLs continued to be identified for these analyte/well pairs; therefore, compliance with the GWPS has not been achieved. Note that statistically significant decreasing trends have been identified for cobalt and thallium in MW-109B. In addition, a statistically significant decreasing trend was newly identified for arsenic in MW-109B in this Fall 2025 statistical evaluation.

5.6.2 Assessment Monitoring Locations

No SSLs were identified in the upper or deeper bedrock assessment monitoring locations.

5.6.3 Corrective Action Monitoring Locations

No SSLs were identified for the assessment constituents in the upper and deeper bedrock corrective action monitoring locations.

For the upper bedrock corrective action constituents listed in Table 3, SSLs over the GWPS remained for arsenic in AW-1, AW-2, MW-12, MW-13, MW-16, MW-17, MW-24, MW-30, MW-32, and MW-34; for thallium in AW-2; and for vinyl chloride in MW-34. While compliance with the GWPS was not achieved, statistically significant decreasing trends were identified for arsenic in

AW-1, MW-12, MW-13, MW-16, MW-17, MW-24, MW-30, and MW-34; thallium in AW-2; and vinyl chloride in MW-34. Note that statistically significant decreasing trends were newly identified for arsenic in MW-13 and MW-16 in this Fall 2025 statistical evaluation.

Compliance with the GWPS was achieved for thallium in MW-20 starting with the Fall 2024 statistical evaluation and remained during the current statistical evaluation. In accordance with IAC 113.10(9)e(2), thallium in MW-20 will return to an assessment constituent in 2027 if the constituent/well pair remains below the GWPS in the interim statistical evaluations.

For the deeper bedrock corrective action constituents listed in Table 3, SSLs continued to be identified for arsenic in CRL-9, MW-14, MW-22, MW-33, and MW-36; and for cobalt in AW-6, CRL-9, and MW-22.

6 Effective Power and Site-Wide False Positive Rate

Statistical power calculations, effective power curves for the 1-of-2 prediction limit plan, and the current site-wide false positive rate (SWFPR) are discussed in detail in Attachment 6. Based on the power curves, the parametric and non-parametric prediction limits have good power. The current cumulative annual SWFPR for the plan is approximately 22%. The current annual SWFPR is higher than the Unified Guidance target 10% false positive rate due to moving from a 1-of-3 to the 1-of-2 prediction plan starting with the Spring 2021 statistical evaluation and the relatively large number of downgradient comparisons with non-parametric prediction limits. Given the number of non-parametric prediction limit evaluations, a background sample size of approximately 80-90 is needed to reduce the SWFPR once again to the 10% target level.

Statistical power calculations for confidence limits compared to the GWPS under assessment monitoring (or assessment mode under corrective action) are included in the confidence interval output of Attachment 4. Details regarding the purpose and procedures for these calculations are provided in Attachment 1. Confidence limits are calculated to meet statistical power levels of 50% for increases in the true concentration mean of 1.5 times a fixed standard, and 80% for increases in the true concentration mean of 2.0 times a fixed standard, as discussed in Unified Guidance Chapter 22 (USEPA, 2009).

7 Conclusions

The methodology described in Attachment 1 was utilized to conduct the statistical evaluations for the upper and deeper bedrock locations in the delineation and corrective action monitoring programs.

In August 2025, semiannual corrective action, background, and delineation monitoring was conducted at upper bedrock wells MW-12, MW-13, MW-16, MW-17, MW-32, MW-37, and MW-101A and deeper bedrock wells MW-14, MW-33, MW-38, MW-101B, and MW-109B. In accordance with Permit Amendment #16, annual detection, assessment, corrective action, and delineation monitoring was also conducted in August 2025 at upper bedrock wells AW-1, AW-2, AW-3, AW-4, AW-5, MW-20, MW-21, MW-23, MW-24, MW-26, MW-28, MW-30, MW-34, MW-35, VP-3, VP-4, MW-105A, MW-106A, MW-107A, and MW-109A and deeper bedrock wells AW-6, CRL-9, MW-11, MW-15, MW-18, MW-19, MW-22, MW-25, MW-31, MW-36, MW-102B, MW-104B, MW-105B, MW-107B, and MW-108B.

7.1 Upper Bedrock Monitoring Locations

A summary of the Fall 2025 statistical evaluation results for the upper bedrock system is presented in Table 13.

Table 13
Summary of the Fall 2025 Evaluation - Upper Bedrock

Monitoring Location	Monitoring Program	Current Schedule [1] (Aug. 2025)	Current SSIs	Corrective Action Constituents		Retesting Parameter	Monitoring Program Changes
				Current SSLs [2]	Achieved Compliance with GWPS		
Downgradient Monitoring Locations							
AW-1	Corrective Action	Appendix II	Chlorobenzene; Thallium	Arsenic			
AW-2	Corrective Action	Appendix II	1,1-Dichloroethane; Barium; Chlorobenzene; cis-1,2-Dichloroethene	Arsenic; Thallium			
AW-3	Assessment	Appendix II	Arsenic				
AW-4	Assessment	Appendix II	Arsenic; Cadmium; Cobalt; Copper; Nickel; Silver				
AW-5	Assessment	Appendix II	Arsenic; Barium; Selenium				
MW-12	Corrective Action	Appendix II	1,1-Dichloroethane; 1,2-Dichlorobenzene; 1,4-Dichlorobenzene; Barium; Chlorobenzene; cis-1,2-Dichloroethene; Nickel; Thallium	Arsenic			
MW-13	Corrective Action	Appendix II	1,2-Dichlorobenzene; 1,4-Dichlorobenzene; Barium; Benzene; Chlorobenzene	Arsenic			
MW-16	Corrective Action	Appendix II	1,1-Dichloroethane; 1,4-Dichlorobenzene	Arsenic			
MW-17	Corrective Action	Appendix II		Arsenic			
MW-20	Corrective Action	Appendix II	Arsenic		Thallium		
MW-21	Assessment	Appendix II	Thallium				
MW-23	Assessment	Appendix II	Thallium				
MW-24	Corrective Action	Appendix II	1,2-Dichlorobenzene; 1,4-Dichlorobenzene; Barium; Benzene; Chlorobenzene; Nickel; Thallium	Arsenic			
MW-26	Assessment	Appendix II	Barium				
MW-28	Assessment	Appendix II	Barium				
MW-30	Corrective Action	Appendix II	Barium; Benzene; Chloroethane; cis-1,2-Dichloroethene	Arsenic			
MW-32	Corrective Action	Appendix II	1,4-Dichlorobenzene; Acetone; Barium; Benzene; Chlorobenzene; Toluene	Arsenic		m/p-Cresol [3]	
MW-34	Corrective Action	Appendix II	1,4-Dichlorobenzene; Acetone; Barium; Benzene; Chlorobenzene; Toluene	Arsenic; Vinyl Chloride			
MW-35	Assessment [4]	Appendix II	Arsenic; Barium				
VP-3	Assessment	Appendix II	Arsenic; Barium				
VP-4	Assessment	Appendix II	Arsenic				

Table 13 Continued
Summary of the Fall 2025 Evaluation - Upper Bedrock

Monitoring Location	Monitoring Program	Current Schedule [1] (Aug. 2025)	Current SSIs	Corrective Action Constituents		Retesting Parameter	Monitoring Program Changes
				Current SSLs [2]	Achieved Compliance with GWPS		
Background Monitoring Locations							
MW-37	Background	Appendix II					
MW-101A	Background	Appendix II					
Delineation Monitoring Locations							
MW-105A	Delineation	Appendix I			Cobalt		
MW-106A	Delineation	Appendix I	Barium	Arsenic; Cobalt			
MW-107A	Delineation	Appendix I	Barium				
MW-109A	Delineation	Appendix I	Barium; Selenium				

[1] Except for MW-26, the five-year resampling for the full Appendix II list was conducted at the assessment, corrective action, and background monitoring locations in Aug. 2025. MW-26 was sampled for Appendix I and detected Appendix II constituents in Aug. 2025.

[2] Analyte/well pairs with SSLs over the GWPS identified during previous statistical evaluations and have not achieved compliance with the GWPS for 3 consecutive years in accordance with 567 IAC 113.10(9)e(2).

[3] m/p-Cresol in MW-32 was newly detected during the five-year resampling for the full Appendix II list conducted in Aug. 2025; therefore, retesting is recommended. Under the retesting plan, an SSI is not declared until one subsequent resample result confirms the detections. A retest sample will be collected for m/p-cresol in MW-32 prior to the next scheduled sampling event.

[4] In accordance with 567 IAC 113.10(9)e(2), cobalt in MW-35 returned to an assessment constituent in 2025 since compliance with the GWPS was maintained for three consecutive years. Since cobalt was the only corrective action constituent in MW-35, MW-35 returned to an assessment monitoring location.

7.1.1 Delineation Monitoring

In August 2025, annual delineation monitoring for the Appendix I list was conducted at MW-105A, MW-106A, MW-107A, and MW-109A. No SSIs were identified at MW-105A. The SSIs identified for the assessment constituents in MW-106A, MW-107A, and MW-109A are summarized in Table 13. No SSLs were identified for the assessment constituents in the upper bedrock delineation monitoring locations.

Cobalt in MW-105A and arsenic and cobalt in MW-106A were evaluated as corrective action constituents due to previously identified SSLs for these analyte/well pairs. The GWPS for cobalt was taken as background since background cobalt concentrations exceeded the 567 IAC Chapter 137 Statewide Standard for a Protected Groundwater Source. Both the *two-sample* prediction limit and the *one-sample* confidence interval or confidence band on the linear trend line testing methods were utilized to compare cobalt in MW-105A and MW-106A to the background GWPS. Compliance with the GWPS was achieved for cobalt in MW-105A starting with the Fall 2024 statistical evaluation and remained during the current statistical evaluation. In accordance with IAC 113.10(9)e(2), cobalt in MW-105A will return to an assessment constituent in 2027 if the constituent/well pair remains below the GWPS in the interim statistical evaluations. SSLs continued to be identified for arsenic and cobalt in MW-106A; therefore, compliance with the GWPS has not been achieved.

Annual delineation monitoring for the Appendix I list will be conducted at MW-105A, MW-106A, MW-107A, and MW-109A in Fall 2026.

7.1.2 Assessment Monitoring

In August 2025, annual assessment monitoring was conducted at AW-3, AW-4, AW-5, MW-21, MW-23, MW-26, MW-28, VP-3, and VP-4. In addition, MW-35 exited corrective action and returned to an assessment monitoring location in August 2025 in accordance with 567 IAC 113.10(9)e(2). In accordance with Permit Amendment #6, the five-year resampling for the full Appendix II list was conducted at the assessment monitoring locations, except for MW-26. In August 2025, MW-26 was sampled for Appendix I and detected Appendix II constituents.

The SSIs identified at the upper bedrock assessment monitoring locations are summarized in Table 13. No SSLs were identified for the upper bedrock assessment monitoring locations.

The Fall 2025 statistical evaluation did not identify upper bedrock assessment monitoring locations with all Appendix II constituents below the interwell prediction limit or laboratory reporting limit for three consecutive sampling events. As a result, none of the upper bedrock locations may exit assessment monitoring at this time.

Annual assessment monitoring for Appendix I and detected Appendix II constituents will be conducted at the assessment monitoring locations in Fall 2026. No new Appendix II constituents were detected above the PQL at the upper bedrock assessment monitoring locations during the 5-year resampling event; therefore, no new constituents will be added to the detected Appendix II constituents during annual assessment monitoring events for the Appendix I and detected Appendix II constituents. In accordance with Permit Amendment #6, the next five-year resampling for the full Appendix II list will be conducted at MW-26 in Fall 2028 and AW-3, AW-4, AW-5, MW-21, MW-23, MW-28, MW-35, VP-3, and VP-4 in Fall 2030.

7.1.3 Corrective Action Monitoring

In August 2025, semiannual corrective action monitoring was conducted at MW-12, MW-13, MW-16, MW-17, and MW-32 and annual corrective action monitoring was conducted at AW-1, AW-2, MW-20, MW-24, MW-30, and MW-34. In accordance with Permit Amendment #6, the five-year resampling for the full Appendix II list was conducted at the corrective action monitoring locations in August 2025.

No SSIs were identified at MW-17. The SSIs identified for the assessment constituents in AW-1, AW-2, MW-12, MW-13, MW-16, MW-20, MW-24, MW-30, MW-32, and MW-34 are summarized in Table 13. No SSLs were identified for the assessment constituents in the upper bedrock corrective action monitoring locations.

For the upper bedrock corrective action constituents listed in Table 3, SSLs over the GWPS remained for arsenic in AW-1, AW-2, MW-12, MW-13, MW-16, MW-17, MW-24, MW-30, MW-32, and MW-34; for thallium in AW-2; and for vinyl chloride in MW-34. While compliance with the GWPS was not achieved, statistically significant decreasing trends were identified for arsenic in AW-1, MW-12, MW-13, MW-16, MW-17, MW-24, MW-30, and MW-34; thallium in AW-2; and vinyl chloride in MW-34.

Compliance with the GWPS was achieved for thallium in MW-20 starting with the Fall 2024 statistical evaluation and remained during the current statistical evaluation. In accordance with IAC 113.10(9)e(2), thallium in MW-20 will return as an assessment constituent in 2027 if the constituent/well pair remains below the GWPS in the interim statistical evaluations.

m/p-Cresol was newly detected above the PQL in MW-32 during the five-year resampling for the full Appendix II list in August 2025; therefore, retesting is recommended. Under the retesting plan, an SSI is not declared until one subsequent resample result confirms the detection. A retest sample will be collected for m/p-cresol in MW-32 prior to the next scheduled sampling event.

Semiannual corrective action monitoring for the Appendix I and detected Appendix II constituents will be conducted at MW-12, MW-13, MW-16, MW-17, and MW-32 in Spring and Fall 2026. Annual corrective action monitoring for the Appendix I and detected Appendix II constituents will be conducted AW-1, AW-2, MW-20, MW-24, MW-30, and MW-34 in Fall 2026. No new Appendix II constituents were detected above the PQL at AW-1, AW-2, MW-12, MW-13, MW-16, MW-17, MW-20, MW-24, MW-30, and MW-34 during the 5-year resampling event; therefore, no new constituents will be added to the detected Appendix II constituents during semiannual or annual corrective action monitoring events for the Appendix I and detected Appendix II constituents. m/p-Cresol will be added as a detected Appendix II constituent for MW-32 during annual corrective monitoring events for the Appendix I and detected Appendix II constituents. In accordance with Permit Amendment #6, the next five-year resampling for the full Appendix II list will be conducted at the corrective action monitoring locations in Fall 2030.

7.1.4 Background Monitoring

Semiannual background monitoring for the full Appendix II list was conducted at MW-37 and MW-101A in August 2025. No new Appendix II constituents were detected at the background monitoring locations during the 5-year resampling event. Semiannual background monitoring for the Appendix I and detected Appendix II constituents will be continued at MW-37 and MW-

101A in Spring and Fall 2026. The next five-year resampling for the full Appendix II list will be conducted at background wells MW-37 and MW-101A in Fall 2030.

7.2 Deeper Bedrock Monitoring Locations

A summary of the Fall 2025 statistical evaluation results for the deeper bedrock system is presented in Table 14.

Table 14
Summary of the Fall 2025 Evaluation - Deeper Bedrock

Monitoring Location	Monitoring Program	Current Schedule [1] (Aug. 2025)	Current SSIs	Corrective Action Constituents		Retesting Parameter	Monitoring Program Changes
				Current SSLs [2]	Achieved Compliance with GWPS		
Downgradient Monitoring Locations							
AW-6	Corrective Action	Appendix II	1,1-Dichloroethane; Barium; Nickel	Cobalt			
CRL-9	Corrective Action	Appendix II	Barium; Benzene; Nickel	Arsenic; Cobalt		o-Toluidine, Sulfide [3]	
MW-11	Assessment	Appendix II	Cobalt				
MW-14	Corrective Action	Appendix II	1,1-Dichloroethane; 1,2-Dichlorobenzene; 1,4-Dichlorobenzene; Barium; Benzene; Chlorobenzene; Cobalt; Nickel	Arsenic			
MW-15	Assessment	Appendix II	Cobalt; Nickel				
MW-18	Assessment	Appendix II	Arsenic; Nickel			Methoxychlor [3]	
MW-19	Assessment	Appendix II	Nickel				
MW-22	Corrective Action	Appendix II	1,1-Dichloroethane; 1,4-Dichlorobenzene; Barium; Chlorobenzene; Nickel	Arsenic; Cobalt			
MW-25	Assessment	Appendix II	Barium				
MW-31	Detection	Appendix I					
MW-33	Corrective Action	Appendix II	Barium; Chlorobenzene; Cobalt	Arsenic			
MW-36	Corrective Action	Appendix II	1,4-Dichlorobenzene; Barium; Chlorobenzene; Cobalt; Nickel	Arsenic			
Background Monitoring Locations							
MW-38	Background	Appendix II					
MW-101B	Background	Appendix II					
Delineation Monitoring Locations							
MW-102B	Delineation	Appendix I	Cobalt				
MW-104B	Delineation	Arsenic [4]					
MW-105B	Delineation	Appendix I	1,1-Dichloroethane; Arsenic; Nickel	Cobalt			
MW-107B	Delineation	Appendix I	Barium; Cobalt; Nickel; Thallium				
MW-108B	Delineation	Appendix I without Cobalt [5]	Barium; Nickel				
MW-109B	Delineation	Appendix I	1,4-Dichlorobenzene; Barium; Chlorobenzene; Nickel	Arsenic; Cobalt; Thallium			

[1] The five-year resampling for the full Appendix II list was conducted at the assessment, corrective action, and background monitoring locations in Aug. 2025.
[2] Analyte/well pairs with SSLs over the GWPS identified during previous statistical evaluations and have not achieved compliance with the GWPS for 3 consecutive years in accordance with 567 IAC 113.10(9)e(2).

(3) o-Toluidine and sulfide in CRL-9 and methoxychlor in MW-18 were newly detected during the five-year resampling for the full Appendix II list conducted in Aug. 2025; therefore, retesting is recommended. Under the retesting plan, an SSI is not declared until one subsequent resample result confirms the detections. Retest samples will be collected for o-toluidine and sulfide in CRL-9 and methoxychlor in MW-18 prior to the next scheduled sampling event.
(4) IDNR approved retaining MW-104B as an arsenic delineation monitoring well in the letter dated May 12, 2016 (IDNR, 2016).
(5) IDNR approved the removal of cobalt from the list of analytes at MW-108B in the letter dated Apr. 16, 2019 (IDNR, 2019).

7.2.1 Detection Monitoring

In August 2025, annual detection monitoring for the Appendix I constituents was conducted at MW-31. No SSIs were identified at MW-31. Annual detection monitoring for the Appendix I list will be conducted at MW-31 in Fall 2026.

7.2.2 Delineation Monitoring

In August 2025, semiannual delineation monitoring was conducted at MW-109B for the Appendix I constituents. In addition, annual delineation monitoring was conducted at MW-102B, MW-105B, and MW-107B for the Appendix I list, at MW-104B for arsenic, and at MW-108B for the Appendix I list without cobalt.

An SSI was not identified for arsenic at MW-104B. The SSIs identified for the assessment constituents in the remaining deeper bedrock delineation monitoring locations are summarized in Table 14. No SSLs were identified for the assessment constituents in the deeper bedrock delineation monitoring locations.

Cobalt in MW-105B and arsenic, cobalt, and thallium in MW-109B were evaluated as corrective action constituents due to previously identified SSLs for these analyte/well pairs. SSLs continued to be identified for these analyte/well pairs; therefore, compliance with the GWPS has not been achieved. While compliance with the GWPS was not achieved, statistically significant decreasing trends were identified for arsenic, cobalt, and thallium in MW-109B.

Semiannual delineation monitoring for the Appendix I constituents will be conducted at MW-109B in Spring and Fall 2026. In Fall 2026, annual delineation monitoring will be conducted at MW-102B, MW-105B, and MW-107B for the Appendix I list, at MW-104B for arsenic, and at MW-108B for the Appendix I list without cobalt.

7.2.3 Assessment Monitoring

In August 2025, annual assessment monitoring was conducted at MW-11, MW-15, MW-18, MW-19, and MW-25. In accordance with Permit Amendment #6, the five-year resampling for the full Appendix II list was conducted at the assessment monitoring locations in August 2025.

The SSIs identified at the deeper bedrock assessment monitoring locations are summarized in Table 14. No SSLs were identified in the deeper bedrock assessment monitoring locations.

The Fall 2025 statistical evaluation did not identify deeper bedrock assessment monitoring locations with all Appendix II constituents below the interwell prediction limit or laboratory reporting limit for three consecutive sampling events. As a result, none of the deeper bedrock locations may exit assessment monitoring at this time.

Methoxychlor was newly detected above the PQL in MW-18 during the five-year resampling for the full Appendix II list in August 2025; therefore, retesting is recommended. Under the retesting plan, an SSI is not declared until one subsequent resample result confirms the detection. A retest sample will be collected for methoxychlor in MW-18 prior to the next scheduled sampling event.

Annual assessment monitoring for Appendix I and detected Appendix II constituents will be conducted at the assessment monitoring locations in Fall 2026. No new Appendix II constituents were detected above the PQL at MW-11, MW-15, MW-19, and MW-25 during the 5-year resampling event; therefore, no new constituents will be added to the detected Appendix II

constituents for these locations during annual assessment monitoring events for the Appendix I and detected Appendix II constituents. Methoxychlor will be added as a detected Appendix II constituent for MW-18 during annual assessment monitoring events for the Appendix I and detected Appendix II constituents. In accordance with Permit Amendment #6, the next five-year resampling for the full Appendix II list will be conducted at the corrective action monitoring locations in Fall 2030.

7.2.4 Corrective Action Monitoring

In August 2025, semiannual corrective action monitoring was conducted at MW-14 and MW-33, and annual corrective action monitoring was conducted at AW-6, CRL-9, MW-22, and MW-36. In accordance with Permit Amendment #6, the five-year resampling for the full Appendix II list was conducted at the corrective action monitoring locations in August 2025.

The SSIs identified for the assessment constituents in the deeper bedrock corrective action monitoring locations are summarized in Table 14. No SSLs were identified for the assessment constituents in the deeper bedrock corrective action monitoring locations.

For the deeper bedrock corrective action constituents listed in Table 3, SSLs continued to be identified for arsenic in CRL-9, MW-14, MW-22, MW-33, and MW-36; and for cobalt in AW-6, CRL-9, and MW-22.

o-Toluidine and sulfide were newly detected above the PQL in CRL-9 during the five-year resampling for the full Appendix II list in August 2025; therefore, retesting is recommended. Under the retesting plan, an SSI is not declared until one subsequent resample result confirms the detections. A retest sample will be collected for o-toluidine and sulfide in CRL-9 prior to the next scheduled sampling event.

Semiannual corrective action monitoring for the Appendix I and detected Appendix II constituents will be conducted at MW-14 and MW-33 in Spring 2026 and Fall 2026. Annual corrective action monitoring for the Appendix I and detected Appendix II constituents will be conducted at AW-6, CRL-9, MW-22, and MW-36 in Fall 2026. No new Appendix II constituents were detected above the PQL at AW-6, MW-14, MW-22, MW-33, and MW-36 during the 5-year resampling event; therefore, no new constituents will be added to the detected Appendix II constituents during semiannual corrective action monitoring events for the Appendix I and detected Appendix II constituents. o-Toluidine and sulfide will be added as detected Appendix II constituents for CRL-9 during semiannual corrective action monitoring events for the Appendix I and detected Appendix II constituents. In accordance with Permit Amendment #6, the next five-year resampling for the full Appendix II list will be conducted at the corrective action monitoring locations in Fall 2030.

7.2.5 Background Monitoring

Semiannual background monitoring for the Appendix I and detected Appendix II constituents was conducted at MW-38 and MW-101B in August 2025. No new Appendix II constituents were detected at the background monitoring locations during the 5-year resampling event. Semiannual background monitoring for the Appendix I and detected Appendix II constituents will be continued at MW-38 and MW-101B in Spring and Fall 2026. The next five-year resampling for the full Appendix II list will be conducted at background wells MW-37 and MW-101A in Fall 2030.

Attachment 1
Detailed Discussion of Statistical Methods

Foth

Memorandum

Statistical Methodology

1. Comparison to Background

For determining which parameters will need a formal statistical treatment, the Unified Guidance (USEPA, 2009) suggests splitting monitoring parameters into three distinct groups: a) reliable indicators selected for formal testing; b) other analytes which are monitored for general groundwater quality information but not statistically tested; and c) those meeting the "never-detected" criteria. Only those parameters with some historically detected presence in background need to be included in the first group and treated with a formal statistical test. Any parameter that has never been detected in background is eligible for the third group of "never-detected" constituents. Constituents with detections below the reporting limit (J-flagged data) will be considered "never-detected." As a means of evaluating the third group, the Unified Guidance suggests the Double Quantification Rule (DQR). The DQR is stated in the Unified Guidance as:

"A confirmed exceedance is registered if any well-constituent pair in the '100% non-detect' group exhibits quantified measurements [i.e., at or above the reporting limit (RL)] in two consecutive sample and resample events."

The Unified Guidance also recommends establishing background sample sizes as large as feasible. The guidance recognizes that small sample sizes in background can be "particularly" troublesome, especially in controlling statistical test false positive and negative rates. With parametric tests (such as parametric prediction limits), the false positive rate may be controlled, but at the expense of statistical power. With non-parametric tests (such as non-parametric prediction limits or the "quasi-statistical" DQR), the false positive rate may be unacceptably high. The Unified Guidance suggests that generally at least 8 to 10 separate background measurements be available, recognizing that statistical power continues to increase with larger sample sizes.

In reports prior to the *2011 Annual Water Quality Report* (Foth, 2012), the ANOVA and a "2x2 contingency table" methods were used to evaluate statistically significant increases (SSIs) over background. These methods met the criteria of 567 Iowa Administrative Code (IAC) 113.10(4)g and h. The ANOVA and "2x2 contingency table" methods were used to maximize the statistical power while minimizing potentially large false positive rates as a result of the smaller sample sizes.

Starting with the *2011 Annual Water Quality Report* (Foth, 2012), the statistical analysis methods utilized for comparison to background were the DQR and "1-of-3" interwell prediction limits as recommended in the Unified Guidance (USEPA, 2009). Note that a "1-of-2" retesting plan was not selected as it would have resulted in a 'low' effective statistical power level for the site based on USEPA reference power curves as defined in the Unified Guidance.

Starting with the Spring 2021 statistical evaluation, the interwell prediction limit retesting plan was modified to a "1-of-2" plan. With increases in the number of background samples, a "1-of-2" plan was able to achieve a 'good' effective statistical power level for the site based on the USEPA reference power curves.

Expansion of the Background Data Set

The background data set was modified in 2013 to add MW-101A and MW-101B to the upper bedrock and deeper bedrock background data sets, respectively. The statistical analysis methods continued the DQR and "1-of-2" interwell prediction limits as recommended in the Unified Guidance (USEPA, 2009), utilizing the pooled data from MW-37 and MW-101A for the upper bedrock system and MW-38 and MW-101B for the deeper bedrock system.

Double Quantification Rule

The DQR will be used to evaluate SSIs over background for the Appendix I and II constituents that were not detected above the reporting limit in the background data sets. An SSI will be indicated for any well-constituent pair with quantified measurements at or above the reporting limit noted for two consecutive sample and resample events. If applicable, the resample will be collected prior to next semiannual sampling event.

Interwell Prediction Limits

Interwell prediction limits will be used to statistically evaluate SSIs over background for the Appendix I and II constituents which have been detected above the reporting limit in the background data set. A "1-of-2" retesting plan will be utilized on individual sample results. The 1-of-2 retesting plan as defined in the Unified Guidance concludes that an SSI has occurred when two out of two sample results exceed the prediction limit, while no SSI is concluded if 1-of-2 are below the limit. If applicable, the resample will be collected prior to next semiannual sampling event. The prediction limit for each constituent will be recalculated semiannually.

For interwell constituents with less than or equal to 50% detects in the background data set, a non-parametric prediction limit will be utilized. The non-parametric prediction limit will be taken as the maximum order statistic (maximum value) of the background data.

For interwell constituents with greater than 50% detects in the background data set, normality assumptions will be verified using the Shapiro-Wilk normality test. If the background data is not normally distributed, a non-parametric prediction limit will be utilized (as described in the paragraph above). If the background data is normally distributed or can be fit to a normal distribution utilizing a normalizing transformation, then a normal-based parametric prediction limit will be applied.

When considering a lognormal prediction limit, a comparison will be made to the maximum order statistic for the background data set. Lognormal prediction limits can be sensitive to smaller departures from lognormality. That is, if data are not truly lognormal, but also not rejected as lognormal, the prediction limit may be inflated because of the transformation. In choosing a lognormal limit, in addition to the percent detections and lognormal goodness of fit criteria, an additional convention will be applied. If the lognormal limit exceeds the level of twice the maximum background concentration, it is assumed that the lognormal model does not adequately fit the background distribution and a non-parametric prediction limit will be selected.

For interwell constituents with 50% to 85% detects in the background data set, Kaplan-Meier estimation will be applied to manage statistical bias introduced by non-detects. For interwell constituents with over 85% detects in the background data set, half the reporting limit will be used for non-detect data. These estimation methods follow Unified Guidance recommendations and are given in detail in Unified Guidance Chapter 15 (USEPA, 2009).

The parametric prediction limit will be calculated as:

$$PL = \bar{x} + k \cdot s$$

where $\bar{x}$ is the sample mean of the August 2008 through current event background data, *s* is the sample standard deviation, and *k* is the multiplier obtained from the Unified Guidance Table 19-1 (USEPA, 2009) for 1-of-2 interwell prediction limits on observations. In determining *k*, the number of constituents of concern (COCs) for formal statistical evaluation along with the number of downgradient wells need to be identified. Per the basic subdivision discussion presented in Section 19.2.1 of the Unified Guidance, along with the discussion regarding the use of the appendix tables for parametric retesting plans given on pages 19-13 through 19-15 of the Unified Guidance (USEPA, 2009), the *k*-multiplier is chosen based on the number of constituents, wells, and evaluations performed annually. When an exact well and COC configuration is not given in the appendix tables, the *k*-multiplier is linearly interpolated as described on page 19-14 of the Unified Guidance (USEPA, 2009).

Sanitas® v10.1. software (Sanitas Technologies) will be used to check distributional assumptions, perform Kaplan-Meier in the case of 50% to 85% detects in the background data set, and calculate the *k*-multipliers and subsequent prediction limits.

Intrawell Prediction Limits

Intrawell prediction limits are calculated in a similar manner to that described above for the interwell case. A main difference between the two methods is the intrawell limit is calculated from a collection of background measurements within the compliance well. A minimum of eight compliance well background samples will be used when calculating the limit.

A second difference is for the parametric prediction limit, in which the *k*-multiplier is modified from the interwell case, as given in Appendix D Tables 19-10 through 19-18 of the Unified Guidance (USEPA, 2009).

Updating intrawell background is performed periodically. The Unified Guidance (Section 5.3.2) recommends that 4 to 8 new compliance observations be collected prior to updating the background dataset. The guidance also states that "a potential update is predicated on there being no statistically significant increase [SSI] recorded for that well constituent, including since the last update." A two-sample t-test or Wilcoxon rank-sum test between existing intrawell background data and the potential set of newer background data is performed, and a non-significant result (α = 0.05) implies that the newer compliance data can be re-classified as background measurements.

For Wilcoxon rank-sum tests, non-detect results cannot be ranked with certainty and the problem is compounded with multiple PQLs and/or J-flagged values (USEPA, 2009). In comparisons where a substantial fraction of non-detect and/or J-flagged measurements or changing PQLs occur, professional judgment will be utilized for evaluating significant differences between the existing intrawell background data and the potential newer set of background data. Consideration will be given to whether significant differences are due to artificial variation introduced by censored data.

2. Comparison to Groundwater Protection Standard – Assessment Monitoring

According to 567 IAC 113.10(6)f and g, under the assessment monitoring program Appendix II results which have been determined to be statistically above background are also statistically compared to the GWPS. If "Appendix II constituents are detected at statistically significant levels above the GWPS" a notice is placed in the operating record and characterization is begun.

Under 567 IAC 113.10(6)h, the GWPS is the maximum contaminant level (MCL) promulgated under Section 1412 of the Safe Drinking Water Act in 40 Code of Federal Regulations (CFR) Part 141. If no MCL exists, or if background concentrations are higher than the MCL, the GWPS is defined as background. Also, per 567 IAC 113.10(6)i, an alternative GWPS may be established by the department for constituents for which there is no MCL such as the "health-based concentrations that comply with the statewide standards for groundwater established pursuant to 567 IAC Chapter 137."

When the GWPS is background concentrations, the statistical methods discussed in the above "1. Comparison to Background" are used. When the GWPS is the MCL or an alternative health-based concentration, per the Unified Guidance (USEPA, 2009), "confidence intervals are the recommended general statistical strategy in compliance/assessment or corrective action monitoring." In the case of normally distributed data, a normal-based parametric confidence interval is used. If the data are not normally distributed a non-parametric confidence interval on the median is used. A lower 99% confidence limit falling above the GWPS implies that concentrations are detected at statistically significant levels above the GWPS with an α-level of 0.01, which is the minimum RCRA regulatory limit from §264.97(i)(2) for an individual test false positive error rate.

The Unified Guidance recognizes that statistical power is also of prime concern to USEPA and that there "should be a high probability that the statistical test will positively identify concentrations that have exceeded a fixed regulatory standard." In compliance/assessment monitoring, instead of pre-specifying the false positive rate prior to computing confidence interval limits, the Unified Guidance suggests the desired level of power (1-β) should be set as an initial target.

For compliance/assessment monitoring purposes, the Unified Guidance (Chapter 22) suggests evaluating increases in the true concentration mean of 1.5 and 2.0 times a fixed standard. (This is similar in concept to the critical power targets in detection monitoring, i.e., 55-60% power at 3σ above background and 80-85% power at 4σ over background). As a general guide, the Unified Guidance suggests there should be at least 70-80% statistical power for detecting increases of 2 times a fixed standard. Specifically, the Unified Guidance recommends there be 50% power of detecting increases in the true concentration mean of 1.5 times a fixed standard (risk ratio of 1.5) and 80% power of detecting increases in the true concentration mean of 2.0 times a fixed standard (risk ratio of 2.0).

To meet these levels of statistical power, α is chosen based on either Unified Guidance Equation 22.1:

$$1 - \beta = G_{T,n-1}\left(t_{1-\alpha,n-1}\middle|\Delta - \sqrt{n}(R-1)\right);$$

where R is the desired risk ratio, $t_{(1-\alpha,n-1)}$ is the $(1-\alpha)$ Student's t-quantile with ($n-1$) degrees of freedom and *G* represents the cumulative non-central t-distribution with ($n-1$) degrees of freedom and noncentrality parameter Δ;

or Unified Guidance Equation 22.2:

$$\alpha \sim 1 - F_{T,n-1}\left(\frac{(R-1)\sqrt{n}}{R \cdot \widehat{CV}} - t_{1-\beta,n-1}\right);$$

where R is the desired risk ratio, n is the sample size, CV is the estimated sample coefficient of variation, $t_{(1-\beta,n-1)}$ is the $(1-\beta)$ Student's t-quantile with (n−1) degrees of freedom, and *F* is the cumulative (central) Student's t-distribution function.

The first equation (Unified Guidance Equation 22.1) assumes a coefficient of variation (CV) =1. This version is used if only poorer estimates of the true CV are available. In practice, a convention has been adopted with the statistical updates to utilize Unified Guidance Equation 22.2 in all cases where a parametric confidence interval is calculated and use Unified Guidance Equation 22.1 when non-parametric confidence intervals are calculated. Since a non-parametric confidence interval is based on the median, it is not as sensitive to departures from normality, and the assumption of a CV=1 in Unified Guidance Equation 22.1 should provide a conservative estimate.

Since 0.01 is the minimum RCRA regulatory limit for α, it is never set lower than this. Conversely, the Unified Guidance recognizes the "difficulty of simultaneously attaining the recommended level of power while controlling the false positive rate, especially for small sample sizes and highly variable data." The Unified Guidance suggests a maximum false positive rate of α=0.2 is a reasonable upper bound.

Finally, like the need for defining a SWFPR under detection monitoring, the Unified Guidance (Chapter 7) recognizes there may be concern about the "use of relatively high individual test-wise false positive rates (α) in order to meet a pre-specified power, especially when considering the cumulative false positive error rate across multiple wells and/or constituents." However, "the Unified Guidance considers computation of cumulative SWFPRs in compliance/assessment testing to be problematic, and reliance on individual test false positive rates preferable." Notwithstanding, if several confidence limit calculations are compared to the GWPS with high α-levels, caution should be taken in the interpretation.

For calculation of confidence intervals, Sanitas® v10.1 software is again used to check distributional assumptions, perform Kaplan-Meier estimation in the case of 50% to 85% detects, and calculate either parametric or nonparametric confidence limits.

3. <u>Comparison to Groundwater Protection Standard – Corrective Action Monitoring</u>

As stated above, if "Appendix II constituents are detected at statistically significant levels above the GWPS" a notice is placed in the operating record and characterization is begun. Owners or operators are required to initiate an assessment of corrective measures, select a remedy, and implement a remedy in accordance with 567 IAC 113.10(7), (8), and (9). For remedy completion in accordance with 567 IAC 113.10(9)e(2), compliance with the GWPS is considered achieved by demonstrating that concentrations of Appendix II constituents have not exceeded the GWPS

for a period of three consecutive years or an alternate length of time established by the Department.

Starting with the Fall 2019 statistical evaluation, individual analyte/well pairs may return to assessment constituents (at the corrective action monitoring location) once compliance with the GWPS has been achieved for a period of 3 years. Note that monitoring wells will not move out of the corrective action monitoring program until all Appendix II constituents have achieved compliance with the GWPS for a period of three consecutive years.

Confidence Intervals in Corrective Action Mode

In the case of the GWPS being a fixed standard as either the 40 CFR Part 141 Safe Drinking Water Act MCL or the 567 IAC Chapter 137 Statewide Standard for a Protected Groundwater Source, "confidence intervals are the recommended general statistical strategy in compliance/assessment or corrective action monitoring" (USEPA, 2009). However, a primary difference between confidence intervals as used under assessment monitoring and confidence intervals used under corrective action is reversal of the null hypothesis. As detailed in Section 7.2 of the Unified Guidance (USEPA, 2009), the hypothesis testing structure under assessment monitoring is to presume compliance point concentrations do not to exceed the fixed standard unless sampling data indicates otherwise. As a formal statistical hypothesis, this is written as:

$$H_0: \Theta \leq G \quad \text{vs.} \quad H_A: \Theta > G$$

In corrective action mode, the hypothesis is reversed. Namely, compliance point concentrations are presumed to exceed the fixed standard and evidence must be presented to demonstrate regulatory compliance. In the case of corrective action, the statistical hypothesis is written as:

$$H_0: \Theta > G \quad \text{vs.} \quad H_A: \Theta \leq G$$

For testing under assessment monitoring, a lower confidence limit (LCL) is compared to the compliance standard *G*. If the LCL is larger than the standard *G*, it is concluded that the compliance standard has been violated.

However, under corrective action monitoring, the upper confidence limit (UCL) is compared to the compliance standard G. In this case, the UCL should lie below the standard to accept the alternative hypothesis that concentration levels are in compliance.

The UCL α-level under corrective action monitoring is set so that a high degree of confidence is achieved in declaring successful remediation. Per the Unified Guidance (Section 7.4.2) "USEPA's overriding concern in corrective action is that remediation efforts are not declared successful without sufficient statistical proof." The Unified Guidance "recommends the use of a reasonably low, fixed test-wide false positive rate (e.g., α = 0.05 or 0.10)." In this case, α = 0.10 corresponds to a 90% UCL.

GWPS as Background

Pursuant to 567 IAC 113.10(6)h, when background concentrations of an analyte exceed the applicable MCL or 567 IAC Statewide Standard for a Protected Groundwater Source, the GWPS is the background concentration. In this case, the GWPS is not a fixed standard but based on a distribution of background sample results.

Section 7.5 of the Unified Guidance (USEPA, 2009) details statistical hypothesis testing under corrective action when the GWPS is background. The Unified Guidance offers two alternative statistical approaches to hypothesis testing in this case. These alternatives are as follows:

A. The first represents a *two-sample* test of two distinct populations, namely the compliance well to background populations. Similar to the statistical tests used under detection and assessment monitoring, with this alternative under corrective action, the Unified Guidance states that "one highly recommended statistical test approach is a prediction limit." The Unified Guidance also states, "whatever the critical value for a selected background test, it becomes the GWPS under compliance/assessment or corrective action monitoring." Further, "the only allowable hypothesis test structure for the two-sample approach follows that of detection and compliance monitoring. Once exceeded and in corrective action, a return to compliance is through evidence that future samples lie below the GWPS using the same hypothesis structure." Therefore, with this approach in corrective action, prediction limits are calculated similarly as in assessment monitoring. Compliance well concentrations below a prediction limit indicate a return to concentrations below the background GWPS.

B. The second involves computation of a fixed statistic from the background data as the GWPS. The Unified Guidance recommendation in this case is to define a fixed GWPS based on a background upper tolerance limit with 95% confidence and 95% coverage. This is designed to be a "reasonable maximum on the likely range of background concentrations." This upper tolerance limit based on background data is then used as a fixed standard in statistical comparisons with 90% or 95% UCLs from compliance wells as discussed previously. Also, with the UCL method, the null hypothesis is reversed from that of assessment monitoring, assuming contamination is above the GWPS. A UCL falling below the background GWPS offers evidence of a return to concentrations below the GWPS. The Unified Guidance refers to this approach as a *single-sample* testing method, since the compliance well population is tested against a defined fixed standard.

The Unified Guidance discusses tradeoffs between the two approaches and does not necessarily prescribe either approach over the other. The Unified Guidance suggests that both approaches may be used, where "the background GWPS would be a range based on the two testing methods rather than a single value."

Normality

For calculation of confidence intervals, Sanitas® v10.1 software is again used to check distributional assumptions, perform Kaplan-Meier estimation in the case of 50% to 85% detects, and calculate either parametric or nonparametric confidence limits. "Corrective Action Mode" is selected for this analysis.

Non-Corrective Action Constituents

As recommended in the Unified Guidance (USEPA, 2009), confidence intervals in corrective action mode will be utilized to evaluate only constituents and monitoring locations with previously identified SSLs over the GWPS. Other compliance constituents (i.e., those without SSLs over the GWPS during prior statistical evaluations) will continue to be evaluated using the "1. Comparison to Background" and "2. Comparison to Groundwater Protection Standard – Assessment Monitoring" methods described above.

Note: The Unified Guidance (USEPA, 2009) states: “it should be recognized that once corrective action or remediation activities are initiated, there will be a considerable time during which the GWPS may still be exceeded. As provided in the RCRA regulations, it is at the conclusion of remediation activities that formal corrective action monitoring evaluation is appropriate. However, in the intervening period of remedial activity, well constituents can still be monitored, and the relative efficacy of remediation measures tracked. The same corrective action hypothesis can be assumed for the targeted constituents; techniques such as trend testing may be appropriate interim applications.” Given the statement above and the intentions of 567 IAC 113.10(6)g, as soon as an SSL is identified for an assessment monitoring constituent/location, then the next statistical evaluation will utilize corrective action monitoring (confidence intervals in corrective action mode).

Data Concentration Shifts During Corrective Action

Confidence intervals assume that the population is stable over time. As a result, confidence intervals may not accurately represent the current well concentrations if increasing or decreasing trends are observed (i.e., during a release or under active remediation). Per the Unified Guidance (USEPA, 2009), lower or upper confidence limits constructed on accumulated data may be overly wide (due to high sample variability caused by combining pre- and post-shift data) and may not be reflective of more recent upward/downward shifts in the contaminant distribution.

Alternative procedures may be applied to data sets with shifting distributions. For example, where trends tests are significant, pre-shift data may be removed from the well/parameter data set for the purposes of constructing the confidence interval. “The reduction in sample size will often be more than offset by the gain in statistical power. More recent measurements may exhibit less variation around the shifted mean value, resulting in a shorter confidence interval” (USEPA, 2009).

Another alternative is to construct confidence bands around the trend line to track progress towards exceeding or meeting a fixed standard. As suggested in the Unified Guidance (Chapter 22), if a trend is present, a 90% confidence band (upper 95% confidence limit) is placed on the linear trend line. If the upper 95% confidence limit on the trend line falls below the GWPS, the well is found to have reduced to levels statistically below the GWPS.

As the discussed in the Unified Guidance, “inferences concerning a linear regression are generally appropriate when two conditions hold: 1) the residuals from the regression are approximately normal or at least reasonably symmetric in distribution; and 2) a plot of residuals versus concentrations indicates a scatter cloud of essentially uniform vertical thickness or width.” These conditions are assessed through normal probability plots of the regression residuals and plots of residuals against the predicted concentrations.

Data Adjustments Due to Exiting Corrective Action

When analyte/well pairs exit corrective action and return to assessment constituents, the hypothesis testing structure is reversed again. In corrective action mode, compliance point concentrations were presumed to exceed the GWPS, and evidence must be presented to demonstrated regulatory compliance (i.e., UCLs below the GWPS for three consecutive years). With the return to assessment constituents, analyte/well pairs have demonstrated regulatory compliance. The hypothesis testing structure reverts to the assessment monitoring structure where compliance point concentrations are presumed to not exceed the GWPS unless sampling

data indicates otherwise (i.e., LCL is above the GWPS). With this reversion in hypothesis, the focus shifts to evaluating concentration changes in the analyte/well pair that would indicate an increase over the GWPS and re-trigger corrective action. For constituents with historical SSLs, earlier concentrations that had previously triggered corrective action are no longer providing useful information regarding the current assessment monitoring hypothesis. Retaining the historical data during the timeframe in which the GWPS was exceeded will result in the regression or confidence interval methods being slower to respond to new increases. As a result, the historical data prior to when statistical compliance with the GWPS was first achieved will be removed when analyte/well pairs exit corrective action and return to assessment constituents.

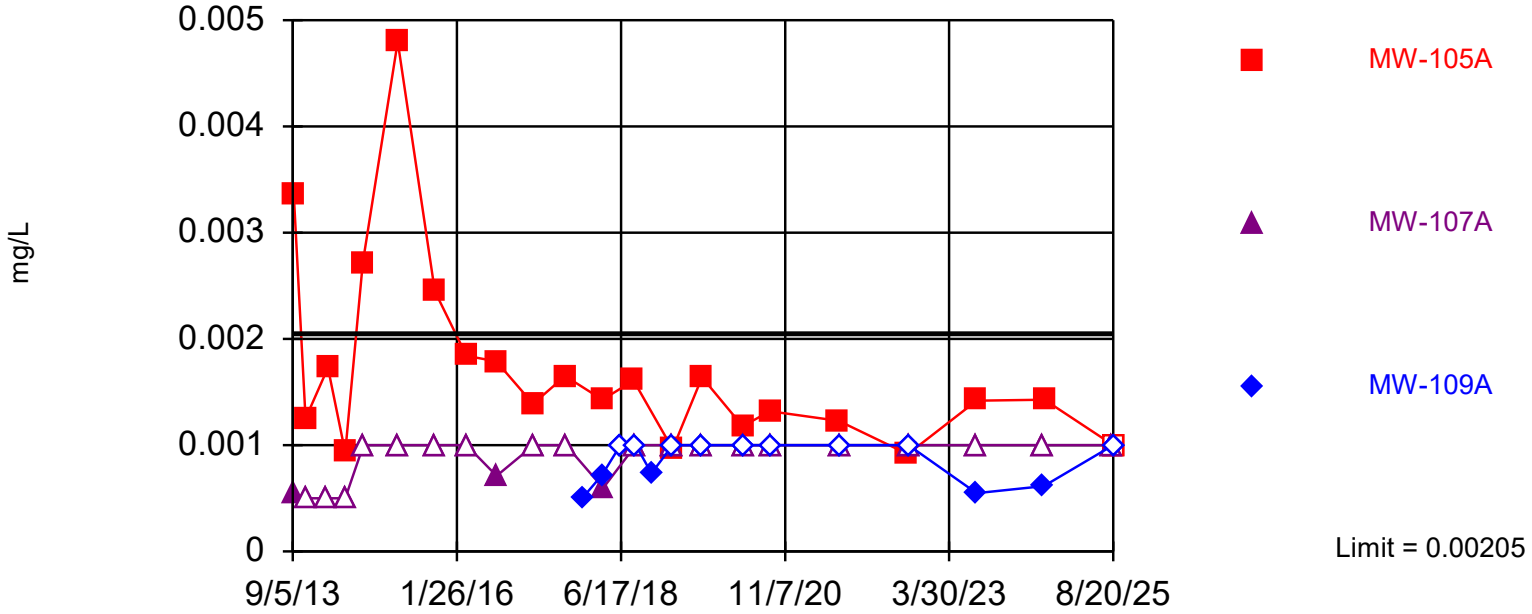
Hollow symbols indicate censored values.

Within Limit

Prediction Limit - Delineation Monitoring
Interwell Non-parametric - Assessment Constituents



Non-parametric test used in lieu of parametric prediction limit because censored data exceeded 50%. Limit is highest of 57 background values. 78.95% NDs. Annual per-constituent alpha = 0.02345. Individual comparison alpha = 0.0005648 (1 of 2).

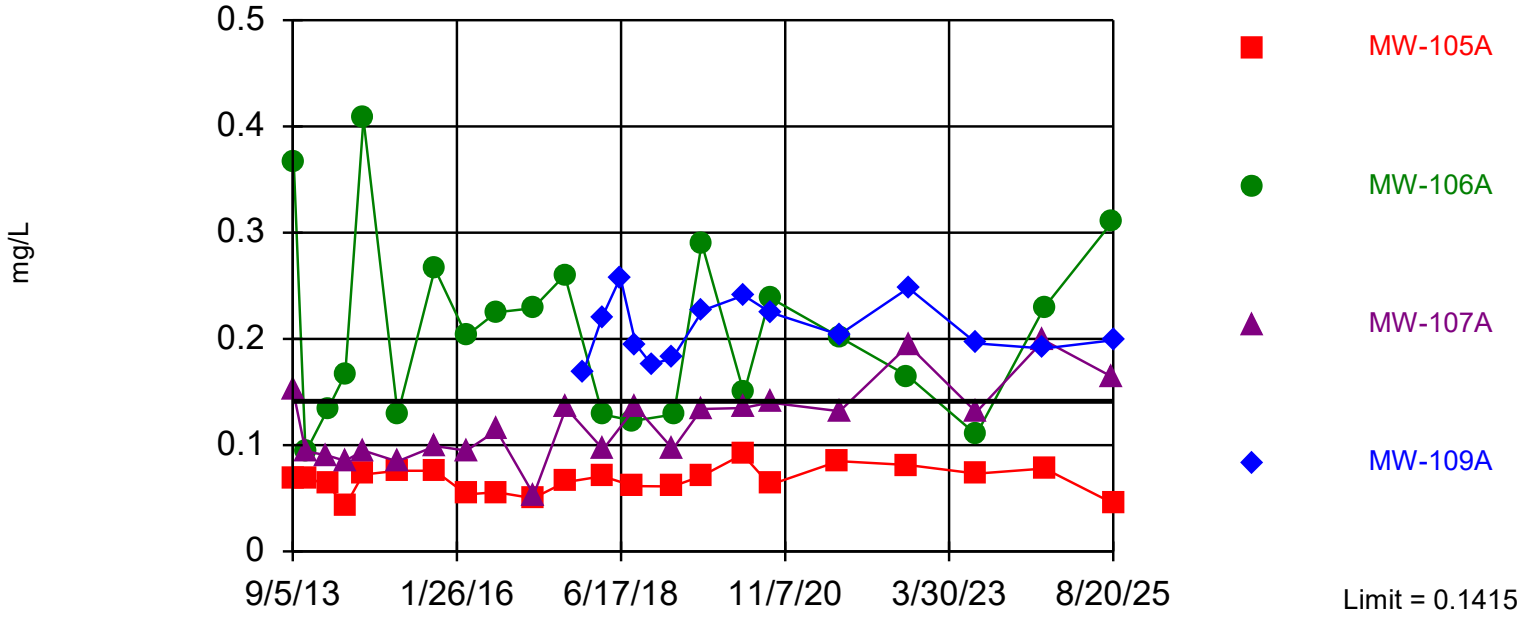
Constituent: Arsenic Analysis Run 10/20/2025 2:57 PM

Linn County SWAL Client: Foth Data: Site 1 Upper Bedrock - Fall 2025 Evaluation

Exceeds Limit: MW-106A, MW-107A, MW-109A

Prediction Limit - Delineation Monitoring - Assessment Constituents

Interwell Parametric



Background Data Summary (based on natural log transformation): Mean=-3.015, Std. Dev.=0.4585, n=53. Normality test: Shapiro Francia @alpha = 0.01, calculated = 0.9417, critical = 0.938. Kappa = 2.311 (c=10, w=42, 1 of 2, event alpha = 0.1). Report alpha = 0.01048. Individual comparison alpha = 0.0002508.

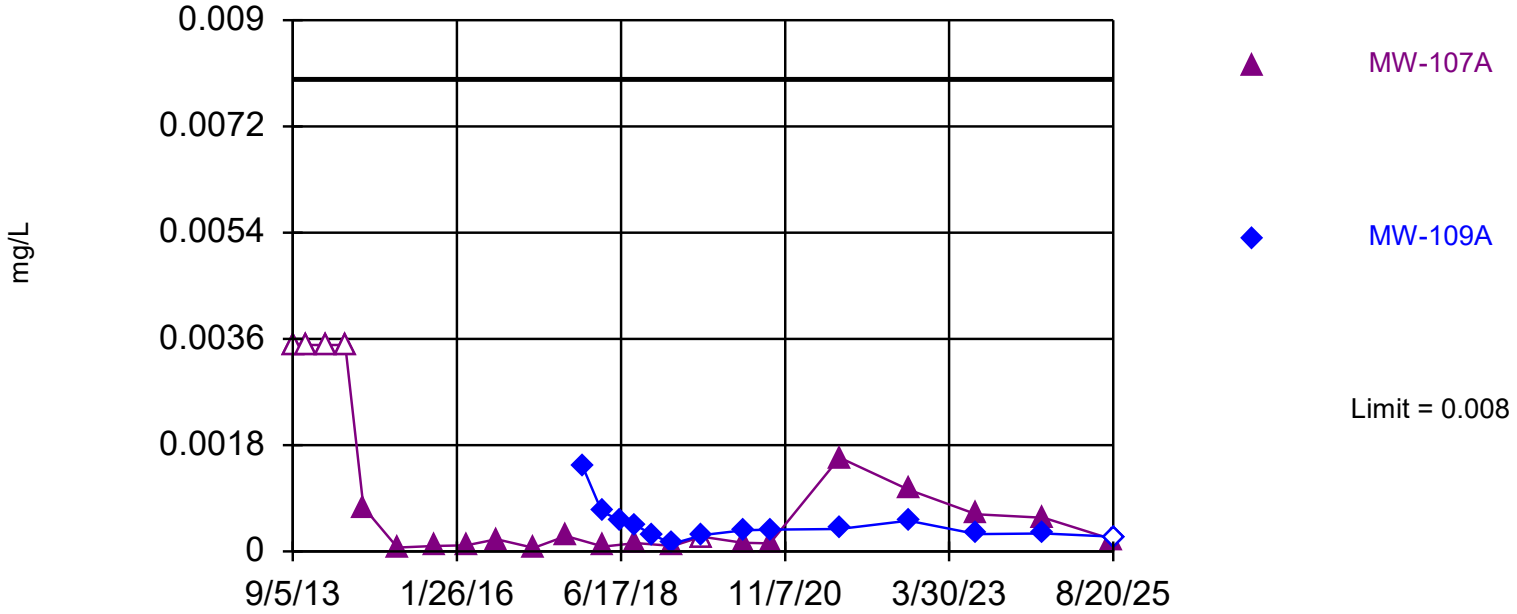
Constituent: Barium Analysis Run 10/20/2025 2:57 PM

Linn County SWAL Client: Foth Data: Site 1 Upper Bedrock - Fall 2025 Evaluation

Sanitas™ v.10.1.01 Software licensed to Foth Infrastructure & Environment, LLC. UG
Hollow symbols indicate censored values.

Within Limit

Prediction Limit - Delineation Monitoring
Interwell Non-parametric - Assessment Constituents



Non-parametric test used in lieu of parametric prediction limit because the Shapiro Wilk normality test showed the data to be non-normal at the 0.01 alpha level. Limit is highest of 44 background values. 29.55% NDs. Annual per-constituent alpha = 0.03775. Individual comparison alpha = 0.0009157 (1 of 2).

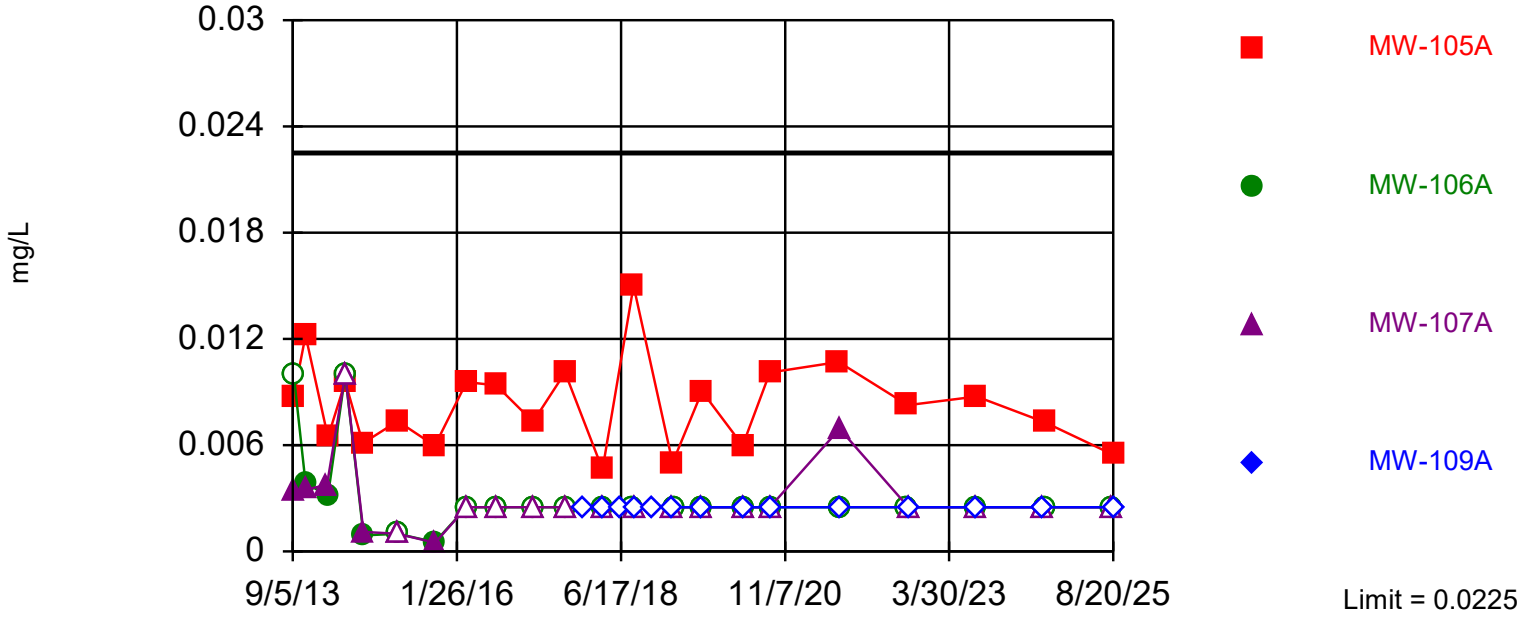
Constituent: Cobalt Analysis Run 10/20/2025 2:57 PM

Linn County SWAL Client: Foth Data: Site 1 Upper Bedrock - Fall 2025 Evaluation

Sanitas™ v.10.1.01 Software licensed to Foth Infrastructure & Environment, LLC. UG
Hollow symbols indicate censored values.

Within Limit

Prediction Limit - Delineation Monitoring
Interwell Non-parametric - Assessment Constituents



Non-parametric test used in lieu of parametric prediction limit because censored data exceeded 50%. Limit is highest of 56 background values. 94.64% NDs. Annual per-constituent alpha = 0.02428. Individual comparison alpha = 0.000585 (1 of 2).

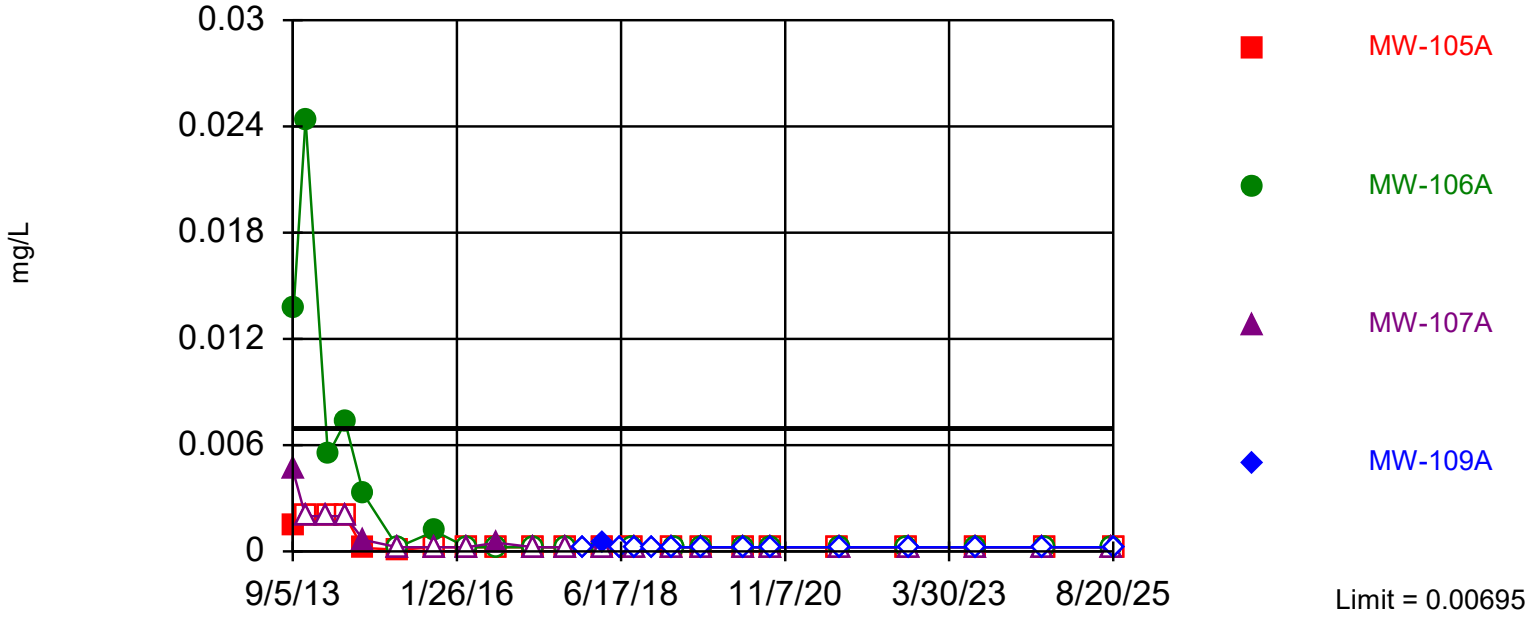
Constituent: Copper Analysis Run 10/20/2025 2:57 PM

Linn County SWAL Client: Foth Data: Site 1 Upper Bedrock - Fall 2025 Evaluation

Sanitas™ v.10.1.01 Software licensed to Foth Infrastructure & Environment, LLC. UG
Hollow symbols indicate censored values.

Within Limit

Prediction Limit - Delineation Monitoring
Interwell Non-parametric - Assessment Constituents



Non-parametric test used in lieu of parametric prediction limit because censored data exceeded 50%. Limit is highest of 55 background values. 80% NDs. Annual per-constituent alpha = 0.02511. Individual comparison alpha = 0.0006052 (1 of 2).

Constituent: Lead Analysis Run 10/20/2025 2:57 PM

Linn County SWAL Client: Foth Data: Site 1 Upper Bedrock - Fall 2025 Evaluation

Non-parametric test used in lieu of parametric prediction limit because censored data exceeded 50%. Limit is highest of 56 background values. 98.21% NDs. Annual per-constituent alpha = 0.02428. Individual comparison alpha = 0.000585 (1 of 2).

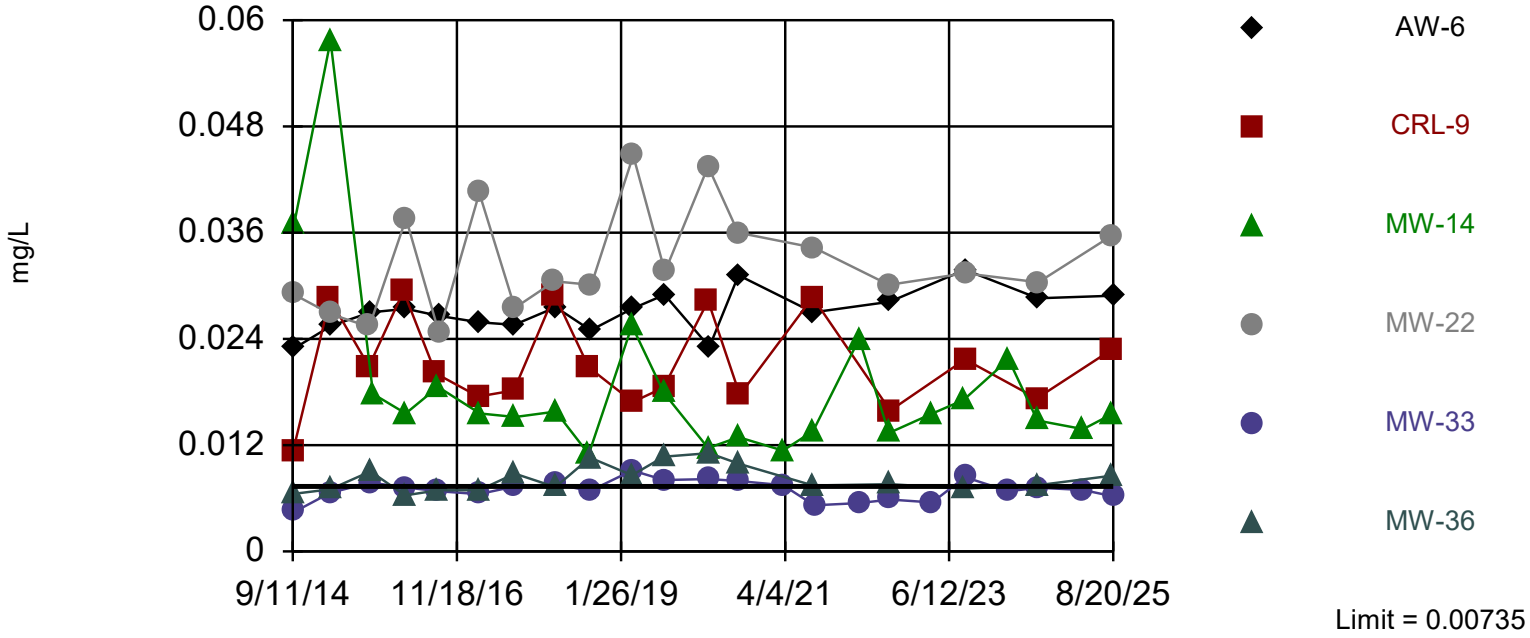
Constituent: Copper Analysis Run 10/21/2025 2:33 PM

Linn County SWAL Client: Foth Data: Site 1 Deeper Bedrock - Fall 2025 Evaluation

Exceeds Limit: AW-6, CRL-9, MW-14, MW-22, MW-36

Prediction Limit - Corrective Action Monitoring

Interwell Non-parametric - Assessment Constituents



Non-parametric test used in lieu of parametric prediction limit because censored data exceeded 50%. Limit is highest of 44 background values. 56.82% NDs. Annual per-constituent alpha = 0.03775. Individual comparison alpha = 0.0009157 (1 of 2).

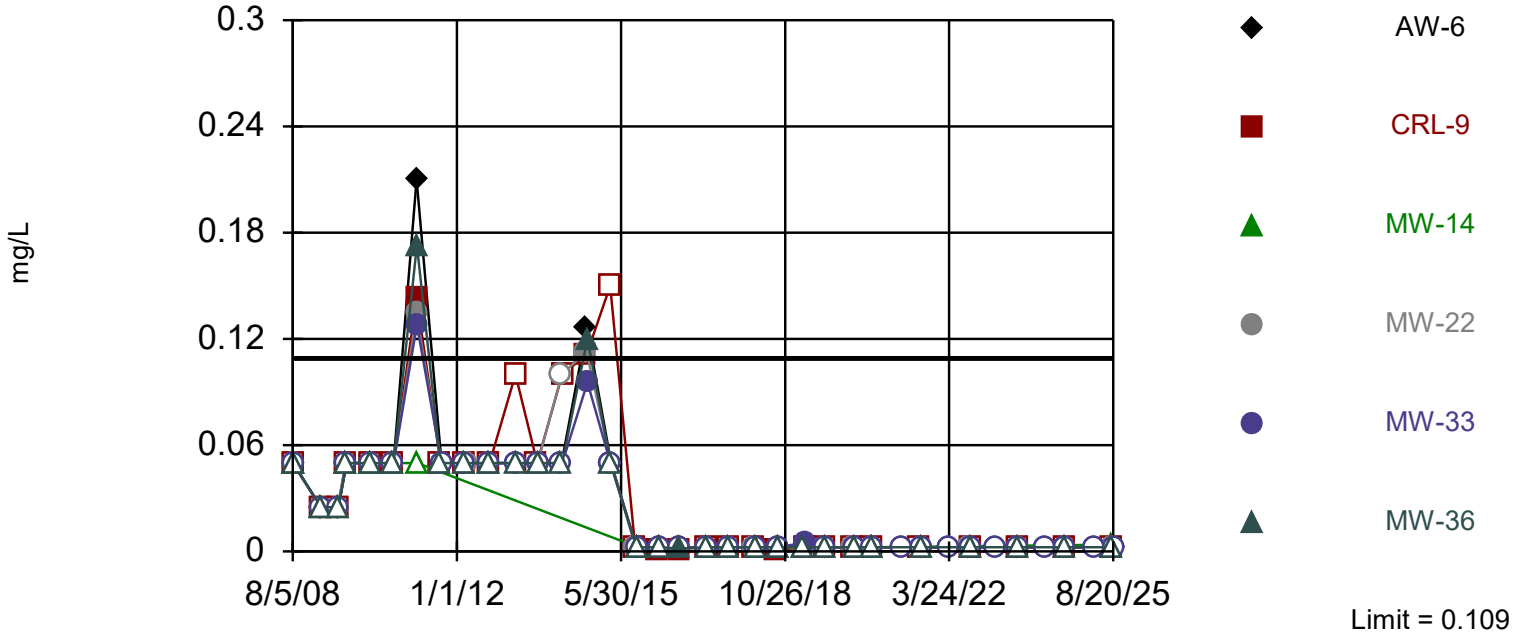
Constituent: Nickel Analysis Run 10/21/2025 2:33 PM

Linn County SWAL Client: Foth Data: Site 1 Deeper Bedrock - Fall 2025 Evaluation

Sanitas™ v.10.1.01 Software licensed to Foth Infrastructure & Environment, LLC. UG
Hollow symbols indicate censored values.

Within Limit

Prediction Limit - Corrective Action Monitoring
Interwell Non-parametric - Assessment Constituents



Non-parametric test used in lieu of parametric prediction limit because censored data exceeded 50%. Limit is highest of 57 background values. 94.74% NDs. Annual per-constituent alpha = 0.02345. Individual comparison alpha = 0.0005648 (1 of 2).

Constituent: Tin Analysis Run 10/21/2025 2:33 PM

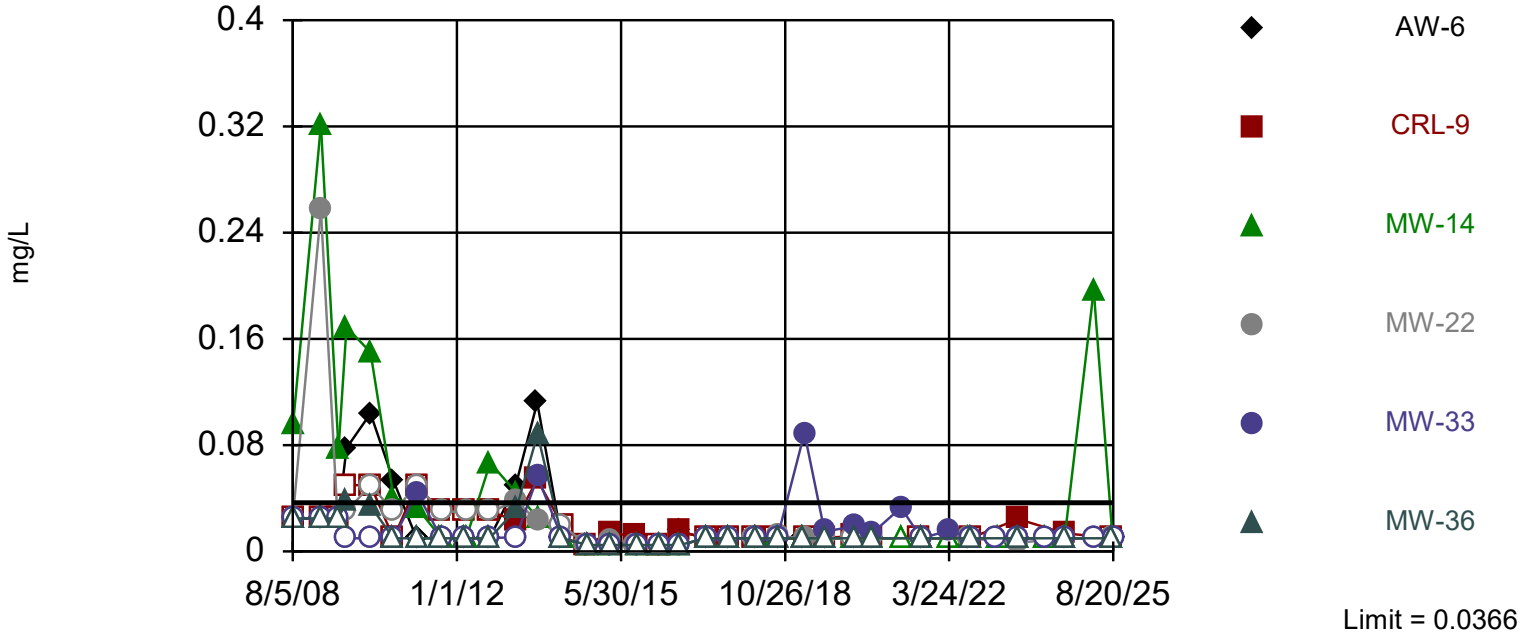
Linn County SWAL Client: Foth Data: Site 1 Deeper Bedrock - Fall 2025 Evaluation

Sanitas™ v.10.1.01 Software licensed to Foth Infrastructure & Environment, LLC. UG
Hollow symbols indicate censored values.

Within Limit

Prediction Limit - Corrective Action Monitoring

Interwell Non-parametric - Assessment Constituents



Non-parametric test used in lieu of parametric prediction limit because censored data exceeded 50%. Limit is highest of 57 background values. 91.23% NDs. Annual per-constituent alpha = 0.02345. Individual comparison alpha = 0.0005648 (1 of 2).

Constituent: Zinc Analysis Run 10/21/2025 2:33 PM

Linn County SWAL Client: Foth Data: Site 1 Deeper Bedrock - Fall 2025 Evaluation

[1] Under assessment mode, an SSL is indicated when the lower confidence limit exceeds the groundwater protection standard (compliance limit).

[2] Value is the 40 CFR Part 141 Safe Drinking Water Act MCL or the IAC 567 Chapter 137 Statewide Standard for a Protected Groundwater Source.

[3] For parametric confidence intervals: Except where otherwise indicated, based on Unified Guidance Equation 22.2, i.e., $\alpha \sim 1 - F_{T,n-1}\left(\frac{(R-1)\sqrt{n}}{R \cdot \overline{CV}} - t_{1-\beta,n-1}\right)$

where R is the desired risk ratio, n is the sample size, CV is the estimated sample coefficient of variation, $t_{1-b,n-1}$ is the (1−b) Student's t-quantile with (n−1) degrees of freedom, and F is the cumulative (central) Student's t-distribution function.

[4] For non-parametric confidence intervals: Based on Unified Guidance Equation 22.1, i.e., $1-\beta = G_{T,n-1}\left(t_{1-\alpha,n-1} \middle| \Delta = \sqrt{n}(R-1)\right)$

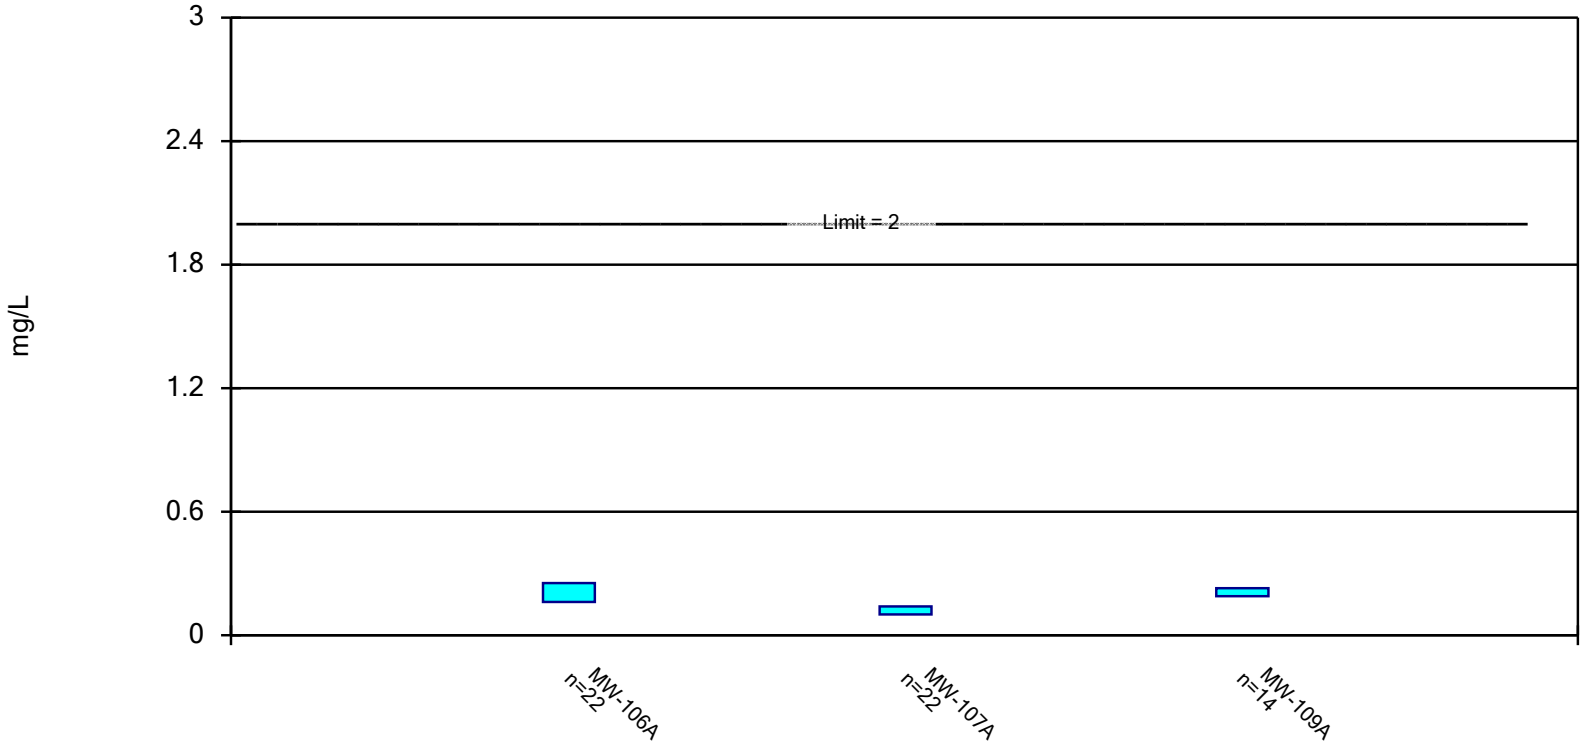
where R is the desired risk ratio, $t_{1-a,n-1}$ is the (1−a) Student's t-quantile with (n−1) degrees of freedom and G represents the cumulative non-central t-distribution with (n−1) degrees of freedom and noncentrality parameter D.

[5] While an alpha of 0.27 was suggested for achieving 80% power of detecting increases in the true concentration mean of 2.0 times a fixed standard, the Unified Guidance suggests a maximum false positive rate of a=0.2 as a reasonable upper bound. Therefore, the maximum a=0.2 was utilized. Additional discussion is provided in Attachment 1.

Sanitas™ v.10.1.01 Software licensed to Foth Infrastructure & Environment, LLC. UG

Parametric Confidence Interval - Delineation Monitoring - Assessment Constituents

Compliance Limit is not exceeded. Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.



Constituent: Barium Analysis Run 10/22/2025 2:58 PM

Linn County SWAL Client: Foth Data: Site 1 Upper Bedrock - Fall 2025 Evaluation

Sanitas™ v.10.1.01 Software licensed to Foth Infrastructure & Environment, LLC. UG

Non-Parametric Confidence Interval - Delineation Monitoring - Assessment Constituents

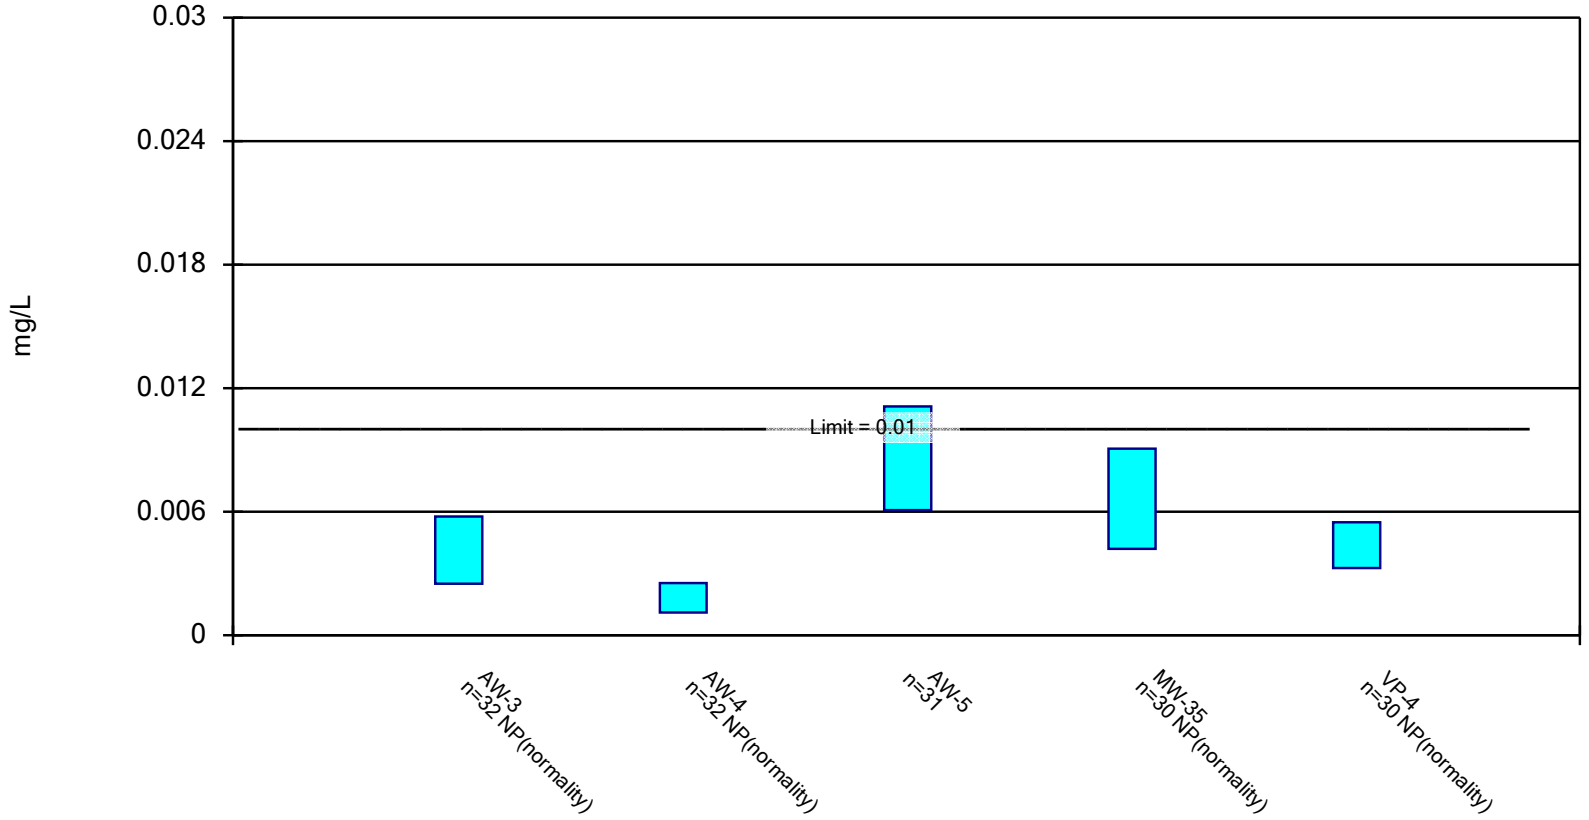
Constituent: Selenium Analysis Run 10/22/2025 3:08 PM

Linn County SWAL Client: Foth Data: Site 1 Upper Bedrock - Fall 2025 Evaluation

Sanitas™ v.10.1.01 Software licensed to Foth Infrastructure & Environment, LLC. UG

Parametric and Non-Parametric (NP) Confidence Interval - Assessment Monitoring

Compliance Limit is not exceeded. Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.



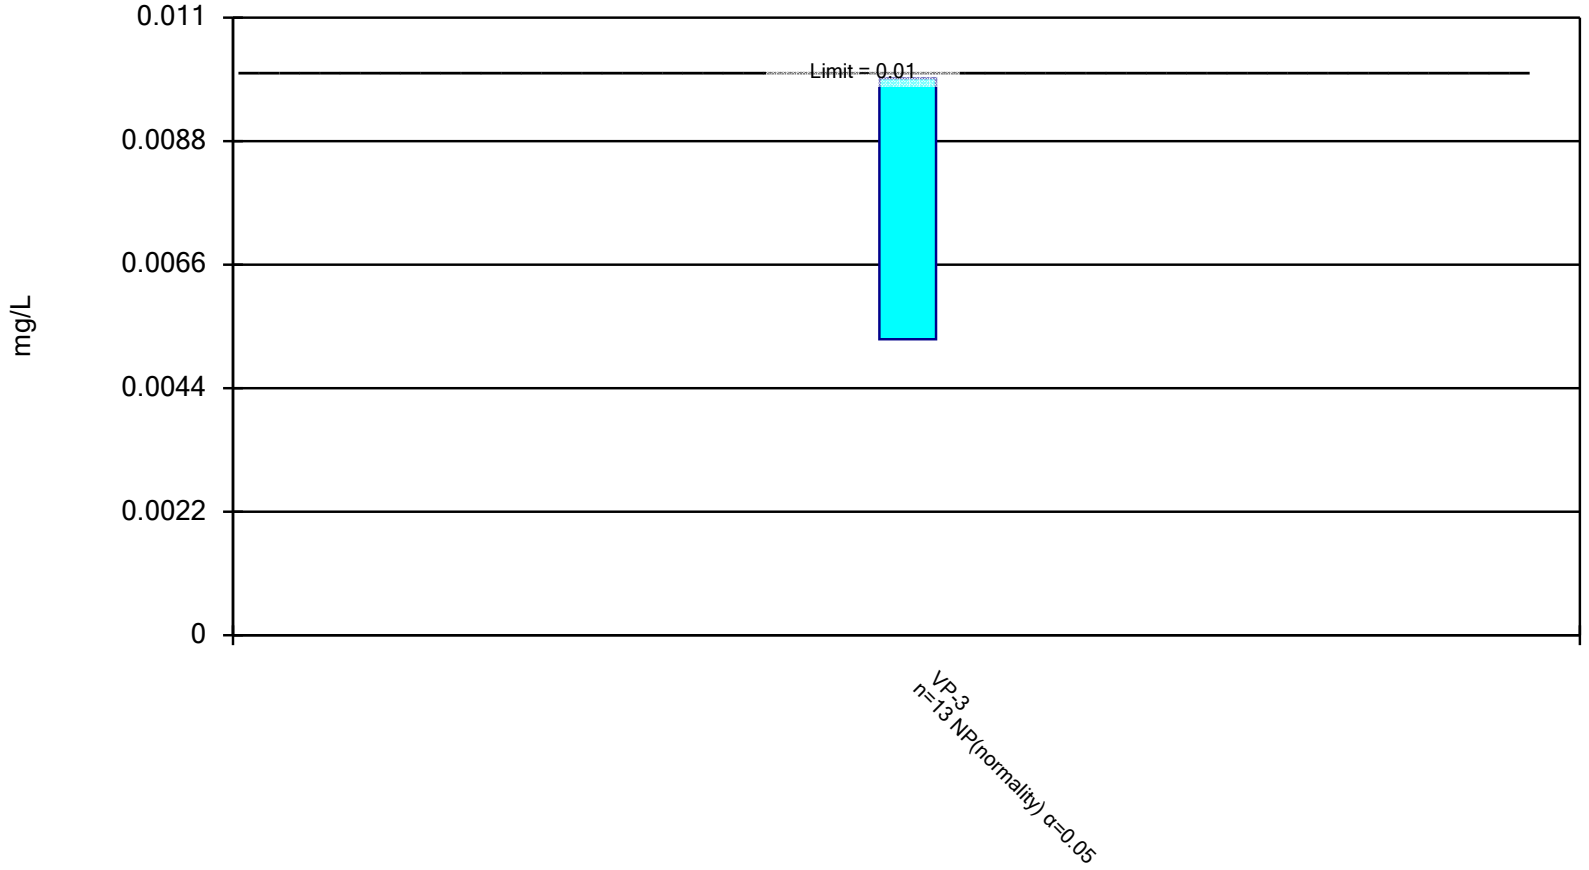
Constituent: Arsenic Analysis Run 10/22/2025 4:13 PM

Linn County SWAL Client: Foth Data: Site 1 Upper Bedrock - Fall 2025 Evaluation

Sanitas™ v.10.1.01 Software licensed to Foth Infrastructure & Environment, LLC. UG

Non-Parametric Confidence Interval - Assessment Monitoring

Compliance Limit is not exceeded.



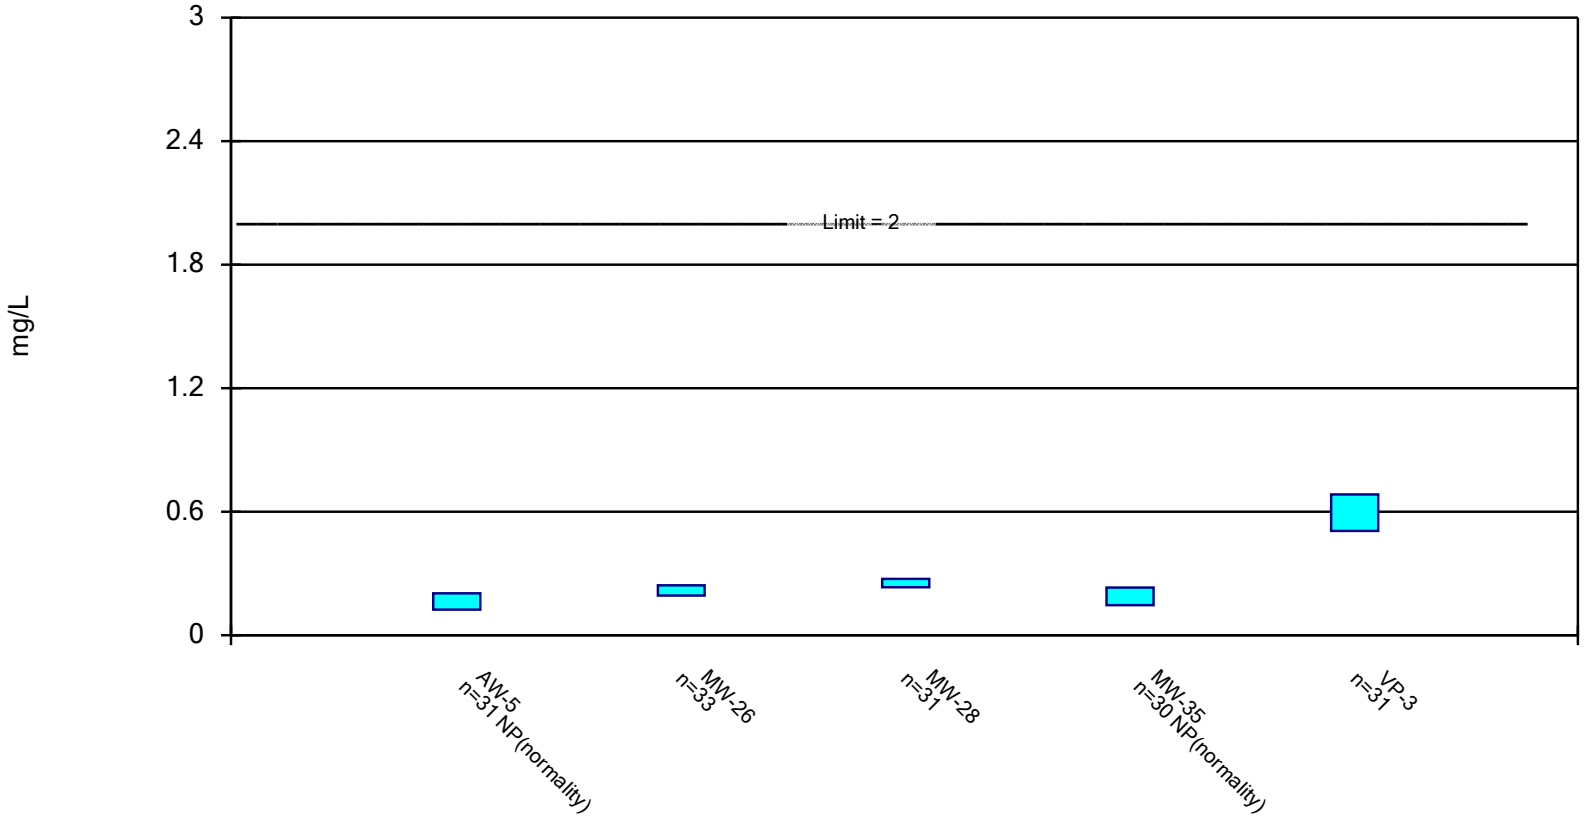
Constituent: Arsenic Analysis Run 10/22/2025 4:15 PM

Linn County SWAL Client: Foth Data: Site 1 Upper Bedrock - Fall 2025 Evaluation

Sanitas™ v.10.1.01 Software licensed to Foth Infrastructure & Environment, LLC. UG

Parametric and Non-Parametric (NP) Confidence Interval - Assessment Monitoring

Compliance Limit is not exceeded. Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.



Constituent: Barium Analysis Run 10/22/2025 3:14 PM

Linn County SWAL Client: Foth Data: Site 1 Upper Bedrock - Fall 2025 Evaluation

Sanitas™ v.10.1.01 Software licensed to Foth Infrastructure & Environment, LLC. UG

Non-Parametric Confidence Interval - Assessment Monitoring

[1] Under assessment mode, an SSL is indicated when the lower confidence limit exceeds the groundwater protection standard (compliance limit).

[2] Value is the 40 CFR Part 141 Safe Drinking Water Act MCL or the IAC 567 Chapter 137 Statewide Standard for a Protected Groundwater Source.

[3] For parametric confidence intervals: Except where otherwise indicated, based on Unified Guidance Equation 22.2, i.e., $\alpha \sim 1 - F_{T,n-1}\left(\frac{(R-1)\sqrt{n}}{R+\widehat{CV}} - t_{1-\beta,n-1}\right)$
where R is the desired risk ratio, n is the sample size, CV is the estimated sample coefficient of variation, $t_{1\text{-}b,n\text{-}1}$ is the (1−b) Student's t-quantile with (n−1) degrees of freedom, and F is the cumulative (central) Student's t-distribution function.

[4] For non-parametric confidence intervals: Based on Unified Guidance Equation 22.1, i.e., $1-\beta = G_{T,n-1}\left(t_{1-\alpha,n-1}\middle|\Delta = \sqrt{n}(R-1)\right)$
where R is the desired risk ratio, $t_{1\text{-}a,n\text{-}1}$ is the (1−a) Student's t-quantile with (n−1) degrees of freedom and G represents the cumulative non-central t-distribution with (n−1) degrees of freedom and noncentrality parameter D.

Thallium (mg/L)	AW-2	Evaluated with Linear Regression Confidence Band Testing Method. Significant Decreasing Trend in Data.											
Thallium (mg/L)	MW-20	Evaluated with Linear Regression Confidence Band Testing Method. Significant Decreasing Trend in Data.											
Vinyl Chloride (ug/l)	MW-34	Evaluated with Linear Regression Confidence Band Testing Method. Significant Decreasing Trend in Data.											

[1] Under corrective action mode, an SSL is rejected when the upper confidence limit lies below the groundwater protection standard (compliance limit).

[2] Value is the 40 CFR Part 141 Safe Drinking Water Act MCL or the IAC 567 Chapter 137 Statewide Standard for a Protected Groundwater Source.

[3] Using the one-sample testing method, the fixed GWPS for cobalt was calculated as the background upper tolerance limit with 95% confidence and 95% coverage. Note that a nonparametric tolerance limit was utilized in the cobalt background calculation. The nonparametric limit achieves 90% coverage.

GWPS (Background) [(1)] = 0.008 mg//L

[(1)] Using the *one-sample* testing method, the fixed GWPS was calculated as the background upper tolerance limit with 95% confidence and 95% coverage.
Note that a nonparametric tolerance limit was utilized in the cobalt background calculation. The nonparametric limit achieves 90% coverage.

First Achieved Compliance with the GWPS

GWPS = 0.01 mg/L

Projected Year to Attain Compliance with the GWPS with First Order Attenuation

10/17/2023 -4.605 0.01

Projected Year to Completion*

2031

MW-30 Arsenic Regression Analysis Continued

*The first order attenuation rate projected that compliance with the GWPS has already been achieved. However, the confidence band placed around the linear trend line (above), has not yet indicated compliance with the GWPS (although it is noted that upper 95% confidence limit is close to statistically achieving compliance with the GWPS) . While a decreasing trend has been identifed, more recent data doesn't fit first order attenuation as well. Assuming future decreases and a better fit for first order attenuation will occur, it is estimated that compliance with the GWPS may be achieved in 2028 with a projected year to completion of 2031.

Projected Year to Completion

2029

MW-34 Vinyl Chloride Regression Analysis Continued

*The first order attenuation rate projected that compliance with the GWPS has already been achieved. However, the confidence band placed around the linear trend line (above), has not yet indicated compliance with the GWPS (although it is noted that upper 95% confidence limit is close to statistically achieving compliance with the GWPS, and the 2019, Apr. 2020, and Aug. 2024 and 2025 individual results were below the GWPS). While an overall decreasing trend has been identifed, individual results have fluctuated above and below the linear trend line. Individual results were below the GWPS between Mar. 2019 and Apr. 2020, above the GWPS between Aug. 2020 and Aug. 2023, and back below the GWPS in Aug. 2024 and Aug. 2025. Assuming future concentrations remain below the GWPS and below or near the linear trend line, it is estimated that compliance with the GWPS may be achieved in 2026 with a projected year to completion of 2029.

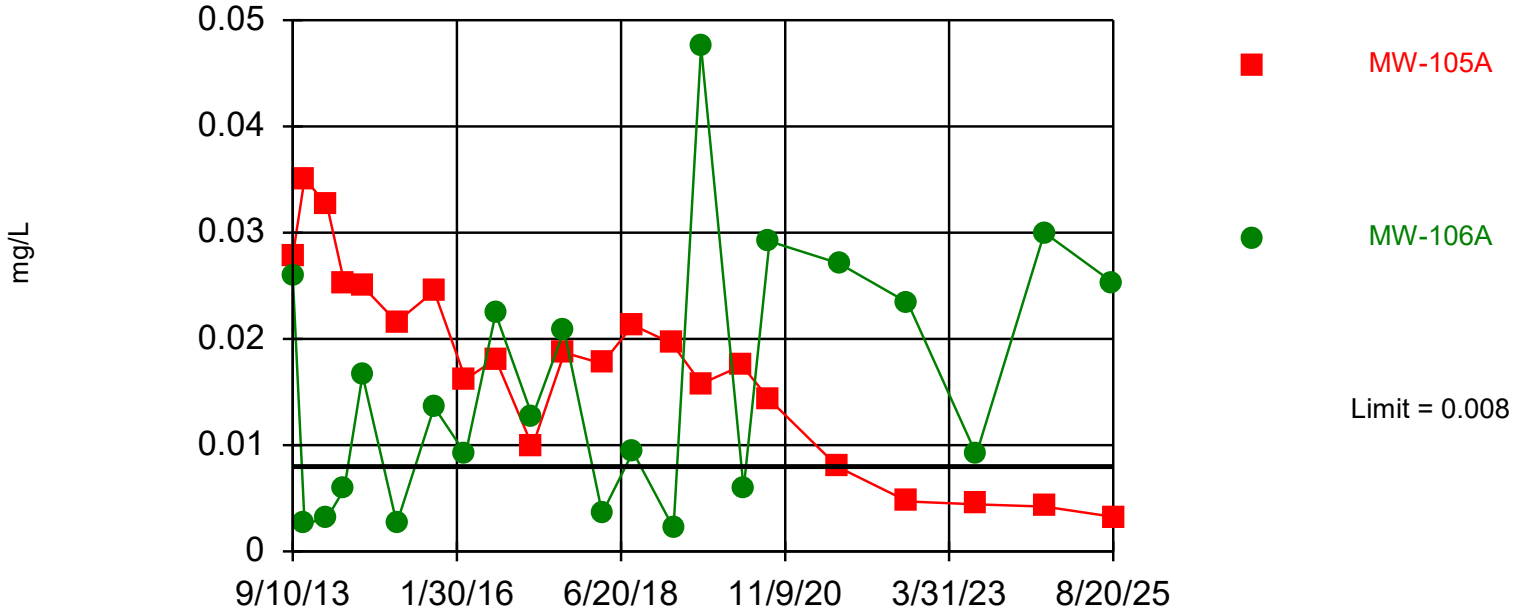
Exceeds Limit: MW-106A

Prediction Limit

Interwell Non-parametric



Non-parametric test used in lieu of parametric prediction limit because the Shapiro Wilk normality test showed the data to be non-normal at the 0.01 alpha level. Limit is highest of 44 background values. 29.55% NDs. Annual per-constituent alpha = 0.03775. Individual comparison alpha = 0.0009157 (1 of 2).

Effective Power and Site-Wide False Positive Rate Discussion

Effective Power and Site-Wide False Positive Rate

Statistical power refers to the ability of a test to identify real increases in concentration levels given they exist. The Unified Guidance defines the effective power as the "probability of detecting contamination in the monitoring network when one and only one well-constituent pair is contaminated." It further states that any statistical test procedure with effective power at least as high as the appropriate USEPA Reference Power Curve (ERPC) should be considered to have reasonable power.

The Unified Guidance gives the following criteria for comparing the effective power to the ERPC:

If the effective power first exceeds the ERPC at a mean concentration increase no greater than 3 background standard deviations, the power is labeled 'good;' if the effective power first exceeds the ERPC at a mean increase between 3 and 4 standard deviations, the power is considered 'acceptable;' and if the first exceedance of the ERPC does not occur until an increase greater than 4 standard deviations, the power is considered 'low.'

Effective power curves were developed with Sanitas for the 1-of-2 prediction limit plan, with power curves illustrated below. Based on the power curves, the parametric and non-parametric prediction limits have good power.

The Unified Guidance "strongly encourages use of a comprehensive design strategy to account for both the cumulative SWFPR and effective power to identify real exceedances." The Unified Guidance recommends and uses an annual SWFPR target of 10%. The current annual SWFPR based on the 1-of-2 prediction limit plan may be calculated using the basic subdivision principle discussed in Unified Guidance Sections 6.2.2, 19.2.1 and 19.4.

Currently, comparisons were made at 9 wells semiannually and 43 wells annually. Based on the Sanitas prediction limit output summarized in Attachment 2 of the Spring and Fall 2025 statistical evaluations, a total of 247 well/constituent pairs resulted for the upper bedrock, and 171 well/constituent pairs for the deeper bedrock, totaling 418 well/ constituent pairs annually for the site.

The cumulative annual SWFPR can be approximated directly from the α-levels reported in the Sanitas output as SWFPR $= 1 - \prod_{i=1}^{418}(1 - \alpha_i) = 0.219 \approx 22\%$. The current annual SWFPR is higher than the Unified Guidance target 10% false positive rate due to moving from a 1-of-3 to the 1-of-2 prediction plan starting with the Spring 2021 statistical evaluation and the relatively large number of downgradient comparisons with nonparametric prediction limits. Given the number of non-parametric prediction limit evaluations, a background sample size of approximately 80-90 is needed to reduce the SWFPR once again to the 10% target level.

Attachment 1 Detailed Discussion of Statistical Methods
Attachment 2 Sanitas Report Output for Double Quantification Rule Evaluations
Attachment 3 References

2 Background

In December 2025, resamples were collected for m/p-cresol in MW-32, o-toluidine and sulfide in CRL-9, and methoxychlor in MW-18 since the well/constituent pairs were newly detected during the five-year resampling for the full Appendix II list conducted in August 2025. The analytical results for the resamples will be provided in Table 14 of the 2025 Annual Water Quality Report (AWQR).

Under the detection monitoring program of 567 IAC 113.10(5), Appendix I monitoring results are statistically compared to background levels as given in 567 IAC 113.10(6)e. Based on the August 2008 through December 2025 results, this memo presents an evaluation of statistically significant increases (SSIs) under the requirements of paragraphs 113.10(4)g and h of 567 IAC.

3 Statistical Methodology

The statistical method utilized for evaluating the resample result was consistent with the methods used in previous statistical evaluations. Detailed descriptions of the statistical

methods are provided in Attachment 1. Sanitas® v10.1 (Sanitas Technologies) software was utilized to complete the statistical comparison.

4 Comparison to Background Levels

4.1 Double Quantification Rule

The Double Quantification Rule (DQR) was used to evaluate SSIs over background for m/p-cresol in MW-32, o-toluidine and sulfide in CRL-9, and methoxychlor in MW-18. The DQR output is included in Attachment 2. The December 2025 resample results did not confirm the single DQR detections identified during the Fall 2025 statistical evaluation; therefore, SSIs were not declared for m/p-cresol in MW-32, o-toluidine and sulfide in CRL-9, and methoxychlor in MW-18. m/p-Cresol in MW-32, o-toluidine and sulfide in CRL-9, and methoxychlor in MW-18 will be added as detected Appendix II constituents during semiannual/annual assessment and corrective action monitoring events for the Appendix I and detected Appendix II constituents.

5 Conclusions

In December 2025, resamples were collected for m/p-cresol in MW-32, o-toluidine and sulfide in CRL-9, and methoxychlor in MW-18 since the well/constituent pairs were newly detected during the five-year resampling for the full Appendix II list conducted in August 2025. The methodology described in Attachment 1 was utilized to conduct the statistical evaluation for the resamples collected at MW-32, CRL-9, and MW-18. SSIs were not identified for m/p-cresol in MW-32, o-toluidine and sulfide in CRL-9, and methoxychlor in MW-18. m/p-Cresol in MW-32, o-toluidine and sulfide in CRL-9, and methoxychlor in MW-18 will be added as detected Appendix II constituents during semiannual/annual assessment and corrective action monitoring events for the Appendix I and detected Appendix II constituents. MW-32 will continue semiannual corrective action monitoring for the Appendix I and detected Appendix II constituents in Spring 2026. In accordance with Permit Amendment #16, annual monitoring for the Appendix I and detected Appendix II constituents will continue for assessment monitoring well MW-18 and corrective action monitoring well CRL-9 in Fall 2026.

Attachment 1
Detailed Discussion of Statistical Methods

Foth

Memorandum

Statistical Methodology

1. Comparison to Background

For determining which parameters will need a formal statistical treatment, the Unified Guidance (USEPA, 2009) suggests splitting monitoring parameters into three distinct groups: a) reliable indicators selected for formal testing; b) other analytes which are monitored for general groundwater quality information but not statistically tested; and c) those meeting the "never-detected" criteria. Only those parameters with some historically detected presence in background need to be included in the first group and treated with a formal statistical test. Any parameter that has never been detected in background is eligible for the third group of "never-detected" constituents. Constituents with detections below the reporting limit (J-flagged data) will be considered "never-detected." As a means of evaluating the third group, the Unified Guidance suggests the Double Quantification Rule (DQR). The DQR is stated in the Unified Guidance as:

"A confirmed exceedance is registered if any well-constituent pair in the '100% non-detect' group exhibits quantified measurements [i.e., at or above the reporting limit (RL)] in two consecutive sample and resample events."

The Unified Guidance also recommends establishing background sample sizes as large as feasible. The guidance recognizes that small sample sizes in background can be "particularly" troublesome, especially in controlling statistical test false positive and negative rates. With parametric tests (such as parametric prediction limits), the false positive rate may be controlled, but at the expense of statistical power. With non-parametric tests (such as non-parametric prediction limits or the "quasi-statistical" DQR), the false positive rate may be unacceptably high. The Unified Guidance suggests that generally at least 8 to 10 separate background measurements be available, recognizing that statistical power continues to increase with larger sample sizes.

In reports prior to the *2011 Annual Water Quality Report* (Foth, 2012), the ANOVA and a "2x2 contingency table" methods were used to evaluate statistically significant increases (SSIs) over background. These methods met the criteria of 567 Iowa Administrative Code (IAC) 113.10(4)g and h. The ANOVA and "2x2 contingency table" methods were used to maximize the statistical power while minimizing potentially large false positive rates as a result of the smaller sample sizes.

Starting with the *2011 Annual Water Quality Report* (Foth, 2012), the statistical analysis methods utilized for comparison to background were the DQR and "1-of-3" interwell prediction limits as recommended in the Unified Guidance (USEPA, 2009). Note that a "1-of-2" retesting plan was not selected as it would have resulted in a 'low' effective statistical power level for the site based on USEPA reference power curves as defined in the Unified Guidance.

Starting with the Spring 2021 statistical evaluation, the interwell prediction limit retesting plan was modified to a "1-of-2" plan. With increases in the number of background samples, a "1-of-2" plan was able to achieve a 'good' effective statistical power level for the site based on the USEPA reference power curves.

Expansion of the Background Data Set

The background data set was modified in 2013 to add MW-101A and MW-101B to the upper bedrock and deeper bedrock background data sets, respectively. The statistical analysis methods continued the DQR and "1-of-2" interwell prediction limits as recommended in the Unified Guidance (USEPA, 2009), utilizing the pooled data from MW-37 and MW-101A for the upper bedrock system and MW-38 and MW-101B for the deeper bedrock system.

Double Quantification Rule

The DQR will be used to evaluate SSIs over background for the Appendix I and II constituents that were not detected above the reporting limit in the background data sets. An SSI will be indicated for any well-constituent pair with quantified measurements at or above the reporting limit noted for two consecutive sample and resample events. If applicable, the resample will be collected prior to next semiannual sampling event.

Interwell Prediction Limits

Interwell prediction limits will be used to statistically evaluate SSIs over background for the Appendix I and II constituents which have been detected above the reporting limit in the background data set. A "1-of-2" retesting plan will be utilized on individual sample results. The 1-of-2 retesting plan as defined in the Unified Guidance concludes that an SSI has occurred when two out of two sample results exceed the prediction limit, while no SSI is concluded if 1-of-2 are below the limit. If applicable, the resample will be collected prior to next semiannual sampling event. The prediction limit for each constituent will be recalculated semiannually.

For interwell constituents with less than or equal to 50% detects in the background data set, a non-parametric prediction limit will be utilized. The non-parametric prediction limit will be taken as the maximum order statistic (maximum value) of the background data.

For interwell constituents with greater than 50% detects in the background data set, normality assumptions will be verified using the Shapiro-Wilk normality test. If the background data is not normally distributed, a non-parametric prediction limit will be utilized (as described in the paragraph above). If the background data is normally distributed or can be fit to a normal distribution utilizing a normalizing transformation, then a normal-based parametric prediction limit will be applied.

When considering a lognormal prediction limit, a comparison will be made to the maximum order statistic for the background data set. Lognormal prediction limits can be sensitive to smaller departures from lognormality. That is, if data are not truly lognormal, but also not rejected as lognormal, the prediction limit may be inflated because of the transformation. In choosing a lognormal limit, in addition to the percent detections and lognormal goodness of fit criteria, an additional convention will be applied. If the lognormal limit exceeds the level of twice the maximum background concentration, it is assumed that the lognormal model does not adequately fit the background distribution and a non-parametric prediction limit will be selected.

For interwell constituents with 50% to 85% detects in the background data set, Kaplan-Meier estimation will be applied to manage statistical bias introduced by non-detects. For interwell constituents with over 85% detects in the background data set, half the reporting limit will be used for non-detect data. These estimation methods follow Unified Guidance recommendations and are given in detail in Unified Guidance Chapter 15 (USEPA, 2009).

The parametric prediction limit will be calculated as:

$$PL = \bar{x} + k \cdot s$$

where $\bar{x}$ is the sample mean of the August 2008 through current event background data, *s* is the sample standard deviation, and *k* is the multiplier obtained from the Unified Guidance Table 19-1 (USEPA, 2009) for 1-of-2 interwell prediction limits on observations. In determining *k*, the number of constituents of concern (COCs) for formal statistical evaluation along with the number of downgradient wells need to be identified. Per the basic subdivision discussion presented in Section 19.2.1 of the Unified Guidance, along with the discussion regarding the use of the appendix tables for parametric retesting plans given on pages 19-13 through 19-15 of the Unified Guidance (USEPA, 2009), the *k*-multiplier is chosen based on the number of constituents, wells, and evaluations performed annually. When an exact well and COC configuration is not given in the appendix tables, the *k*-multiplier is linearly interpolated as described on page 19-14 of the Unified Guidance (USEPA, 2009).

Sanitas® v10.1 software (Sanitas Technologies) will be used to check distributional assumptions, perform Kaplan-Meier in the case of 50% to 85% detects in the background data set, and calculate the *k*-multipliers and subsequent prediction limits.

Intrawell Prediction Limits

Intrawell prediction limits are calculated in a similar manner to that described above for the interwell case. A main difference between the two methods is the intrawell limit is calculated from a collection of background measurements within the compliance well. A minimum of eight compliance well background samples will be used when calculating the limit.

A second difference is for the parametric prediction limit, in which the *k*-multiplier is modified from the interwell case, as given in Appendix D Tables 19-10 through 19-18 of the Unified Guidance (USEPA, 2009).

Updating intrawell background is performed periodically. The Unified Guidance (Section 5.3.2) recommends that 4 to 8 new compliance observations be collected prior to updating the background dataset. The guidance also states that "a potential update is predicated on there being no statistically significant increase [SSI] recorded for that well constituent, including since the last update." A two-sample t-test or Wilcoxon rank-sum test between existing intrawell background data and the potential set of newer background data is performed, and a non-significant result (α = 0.05) implies that the newer compliance data can be re-classified as background measurements.

For Wilcoxon rank-sum tests, non-detect results cannot be ranked with certainty and the problem is compounded with multiple PQLs and/or J-flagged values (USEPA, 2009). In comparisons where a substantial fraction of non-detect and/or J-flagged measurements or changing PQLs occur, professional judgment will be utilized for evaluating significant differences between the existing intrawell background data and the potential newer set of background data. Consideration will be given to whether significant differences are due to artificial variation introduced by censored data.

2. Comparison to Groundwater Protection Standard – Assessment Monitoring

According to 567 IAC 113.10(6)f and g, under the assessment monitoring program Appendix II results which have been determined to be statistically above background are also statistically compared to the GWPS. If "Appendix II constituents are detected at statistically significant levels above the GWPS" a notice is placed in the operating record and characterization is begun.

Under 567 IAC 113.10(6)h, the GWPS is the maximum contaminant level (MCL) promulgated under Section 1412 of the Safe Drinking Water Act in 40 Code of Federal Regulations (CFR) Part 141. If no MCL exists, or if background concentrations are higher than the MCL, the GWPS is defined as background. Also, per 567 IAC 113.10(6)i, an alternative GWPS may be established by the department for constituents for which there is no MCL such as the "health-based concentrations that comply with the statewide standards for groundwater established pursuant to 567 IAC Chapter 137."

When the GWPS is background concentrations, the statistical methods discussed in the above "1. Comparison to Background" are used. When the GWPS is the MCL or an alternative health-based concentration, per the Unified Guidance (USEPA, 2009), "confidence intervals are the recommended general statistical strategy in compliance/assessment or corrective action monitoring." In the case of normally distributed data, a normal-based parametric confidence interval is used. If the data are not normally distributed a non-parametric confidence interval on the median is used. A lower 99% confidence limit falling above the GWPS implies that concentrations are detected at statistically significant levels above the GWPS with an α-level of 0.01, which is the minimum RCRA regulatory limit from §264.97(i)(2) for an individual test false positive error rate.

The Unified Guidance recognizes that statistical power is also of prime concern to USEPA and that there "should be a high probability that the statistical test will positively identify concentrations that have exceeded a fixed regulatory standard." In compliance/assessment monitoring, instead of pre-specifying the false positive rate prior to computing confidence interval limits, the Unified Guidance suggests the desired level of power (1-β) should be set as an initial target.

For compliance/assessment monitoring purposes, the Unified Guidance (Chapter 22) suggests evaluating increases in the true concentration mean of 1.5 and 2.0 times a fixed standard. (This is similar in concept to the critical power targets in detection monitoring, i.e., 55-60% power at 3σ above background and 80-85% power at 4σ over background). As a general guide, the Unified Guidance suggests there should be at least 70-80% statistical power for detecting increases of 2 times a fixed standard. Specifically, the Unified Guidance recommends there be 50% power of detecting increases in the true concentration mean of 1.5 times a fixed standard (risk ratio of 1.5) and 80% power of detecting increases in the true concentration mean of 2.0 times a fixed standard (risk ratio of 2.0).

To meet these levels of statistical power, α is chosen based on either Unified Guidance Equation 22.1:

$$1 - \beta = G_{T,n-1}\left(t_{1-\alpha,n-1}\middle|\Delta - \sqrt{n}(R-1)\right);$$

where R is the desired risk ratio, $t_{(1-\alpha,n-1)}$ is the (1−α) Student's t-quantile with (n−1) degrees of freedom and G represents the cumulative non-central t-distribution with (n−1) degrees of freedom and noncentrality parameter Δ;

or Unified Guidance Equation 22.2:

$$\alpha \sim 1 - F_{T,n-1}\left(\frac{(R-1)\sqrt{n}}{R \cdot \widehat{CV}} - t_{1-\beta,n-1}\right);$$

where R is the desired risk ratio, n is the sample size, CV is the estimated sample coefficient of variation, $t_{(1-\beta,n-1)}$ is the (1−β) Student's t-quantile with (n−1) degrees of freedom, and F is the cumulative (central) Student's t-distribution function.

The first equation (Unified Guidance Equation 22.1) assumes a coefficient of variation (CV) =1. This version is used if only poorer estimates of the true CV are available. In practice, a convention has been adopted with the statistical updates to utilize Unified Guidance Equation 22.2 in all cases where a parametric confidence interval is calculated and use Unified Guidance Equation 22.1 when non-parametric confidence intervals are calculated. Since a non-parametric confidence interval is based on the median, it is not as sensitive to departures from normality, and the assumption of a CV=1 in Unified Guidance Equation 22.1 should provide a conservative estimate.

Since 0.01 is the minimum RCRA regulatory limit for α, it is never set lower than this. Conversely, the Unified Guidance recognizes the "difficulty of simultaneously attaining the recommended level of power while controlling the false positive rate, especially for small sample sizes and highly variable data." The Unified Guidance suggests a maximum false positive rate of α=0.2 is a reasonable upper bound.

Finally, like the need for defining a SWFPR under detection monitoring, the Unified Guidance (Chapter 7) recognizes there may be concern about the "use of relatively high individual test-wise false positive rates (α) in order to meet a pre-specified power, especially when considering the cumulative false positive error rate across multiple wells and/or constituents." However, "the Unified Guidance considers computation of cumulative SWFPRs in compliance/assessment testing to be problematic, and reliance on individual test false positive rates preferable." Notwithstanding, if several confidence limit calculations are compared to the GWPS with high α-levels, caution should be taken in the interpretation.

For calculation of confidence intervals, Sanitas® v10.1 software is again used to check distributional assumptions, perform Kaplan-Meier estimation in the case of 50% to 85% detects, and calculate either parametric or nonparametric confidence limits.

3. Comparison to Groundwater Protection Standard – Corrective Action Monitoring

As stated above, if "Appendix II constituents are detected at statistically significant levels above the GWPS" a notice is placed in the operating record and characterization is begun. Owners or operators are required to initiate an assessment of corrective measures, select a remedy, and implement a remedy in accordance with 567 IAC 113.10(7), (8), and (9). For remedy completion in accordance with 567 IAC 113.10(9)e(2), compliance with the GWPS is considered achieved by demonstrating that concentrations of Appendix II constituents have not exceeded the GWPS

for a period of three consecutive years or an alternate length of time established by the Department.

Starting with the Fall 2019 statistical evaluation, individual analyte/well pairs may return to assessment constituents (at the corrective action monitoring location) once compliance with the GWPS has been achieved for a period of 3 years. Note that monitoring wells will not move out of the corrective action monitoring program until all Appendix II constituents have achieved compliance with the GWPS for a period of three consecutive years.

Confidence Intervals in Corrective Action Mode

In the case of the GWPS being a fixed standard as either the 40 CFR Part 141 Safe Drinking Water Act MCL or the 567 IAC Chapter 137 Statewide Standard for a Protected Groundwater Source, "confidence intervals are the recommended general statistical strategy in compliance/assessment or corrective action monitoring" (USEPA, 2009). However, a primary difference between confidence intervals as used under assessment monitoring and confidence intervals used under corrective action is reversal of the null hypothesis. As detailed in Section 7.2 of the Unified Guidance (USEPA, 2009), the hypothesis testing structure under assessment monitoring is to presume compliance point concentrations do not to exceed the fixed standard unless sampling data indicates otherwise. As a formal statistical hypothesis, this is written as:

$$H_0: \Theta \leq G \quad \text{vs.} \quad H_A: \Theta > G$$

In corrective action mode, the hypothesis is reversed. Namely, compliance point concentrations are presumed to exceed the fixed standard and evidence must be presented to demonstrate regulatory compliance. In the case of corrective action, the statistical hypothesis is written as:

$$H_0: \Theta > G \quad \text{vs.} \quad H_A: \Theta \leq G$$

For testing under assessment monitoring, a lower confidence limit (LCL) is compared to the compliance standard *G*. If the LCL is larger than the standard *G*, it is concluded that the compliance standard has been violated.

However, under corrective action monitoring, the upper confidence limit (UCL) is compared to the compliance standard G. In this case, the UCL should lie below the standard to accept the alternative hypothesis that concentration levels are in compliance.

The UCL α-level under corrective action monitoring is set so that a high degree of confidence is achieved in declaring successful remediation. Per the Unified Guidance (Section 7.4.2) "USEPA's overriding concern in corrective action is that remediation efforts are not declared successful without sufficient statistical proof." The Unified Guidance "recommends the use of a reasonably low, fixed test-wide false positive rate (e.g., α = 0.05 or 0.10)." In this case, α = 0.10 corresponds to a 90% UCL.

GWPS as Background

Pursuant to 567 IAC 113.10(6)h, when background concentrations of an analyte exceed the applicable MCL or 567 IAC Statewide Standard for a Protected Groundwater Source, the GWPS is the background concentration. In this case, the GWPS is not a fixed standard but based on a distribution of background sample results.

Section 7.5 of the Unified Guidance (USEPA, 2009) details statistical hypothesis testing under corrective action when the GWPS is background. The Unified Guidance offers two alternative statistical approaches to hypothesis testing in this case. These alternatives are as follows:

A. The first represents a *two-sample* test of two distinct populations, namely the compliance well to background populations. Similar to the statistical tests used under detection and assessment monitoring, with this alternative under corrective action, the Unified Guidance states that "one highly recommended statistical test approach is a prediction limit." The Unified Guidance also states, "whatever the critical value for a selected background test, it becomes the GWPS under compliance/assessment or corrective action monitoring." Further, "the only allowable hypothesis test structure for the two-sample approach follows that of detection and compliance monitoring. Once exceeded and in corrective action, a return to compliance is through evidence that future samples lie below the GWPS using the same hypothesis structure." Therefore, with this approach in corrective action, prediction limits are calculated similarly as in assessment monitoring. Compliance well concentrations below a prediction limit indicate a return to concentrations below the background GWPS.

B. The second involves computation of a fixed statistic from the background data as the GWPS. The Unified Guidance recommendation in this case is to define a fixed GWPS based on a background upper tolerance limit with 95% confidence and 95% coverage. This is designed to be a "reasonable maximum on the likely range of background concentrations." This upper tolerance limit based on background data is then used as a fixed standard in statistical comparisons with 90% or 95% UCLs from compliance wells as discussed previously. Also, with the UCL method, the null hypothesis is reversed from that of assessment monitoring, assuming contamination is above the GWPS. A UCL falling below the background GWPS offers evidence of a return to concentrations below the GWPS. The Unified Guidance refers to this approach as a *single-sample* testing method, since the compliance well population is tested against a defined fixed standard.

The Unified Guidance discusses tradeoffs between the two approaches and does not necessarily prescribe either approach over the other. The Unified Guidance suggests that both approaches may be used, where "the background GWPS would be a range based on the two testing methods rather than a single value."

Normality

For calculation of confidence intervals, Sanitas® v10.1 software is again used to check distributional assumptions, perform Kaplan-Meier estimation in the case of 50% to 85% detects, and calculate either parametric or nonparametric confidence limits. "Corrective Action Mode" is selected for this analysis.

Non-Corrective Action Constituents

As recommended in the Unified Guidance (USEPA, 2009), confidence intervals in corrective action mode will be utilized to evaluate only constituents and monitoring locations with previously identified SSLs over the GWPS. Other compliance constituents (i.e., those without SSLs over the GWPS during prior statistical evaluations) will continue to be evaluated using the "1. Comparison to Background" and "2. Comparison to Groundwater Protection Standard – Assessment Monitoring" methods described above.

Note: The Unified Guidance (USEPA, 2009) states: “it should be recognized that once corrective action or remediation activities are initiated, there will be a considerable time during which the GWPS may still be exceeded. As provided in the RCRA regulations, it is at the conclusion of remediation activities that formal corrective action monitoring evaluation is appropriate. However, in the intervening period of remedial activity, well constituents can still be monitored, and the relative efficacy of remediation measures tracked. The same corrective action hypothesis can be assumed for the targeted constituents; techniques such as trend testing may be appropriate interim applications.” Given the statement above and the intentions of 567 IAC 113.10(6)g, as soon as an SSL is identified for an assessment monitoring constituent/location, then the next statistical evaluation will utilize corrective action monitoring (confidence intervals in corrective action mode).

Data Concentration Shifts During Corrective Action

Confidence intervals assume that the population is stable over time. As a result, confidence intervals may not accurately represent the current well concentrations if increasing or decreasing trends are observed (i.e., during a release or under active remediation). Per the Unified Guidance (USEPA, 2009), lower or upper confidence limits constructed on accumulated data may be overly wide (due to high sample variability caused by combining pre- and post-shift data) and may not be reflective of more recent upward/downward shifts in the contaminant distribution.

Alternative procedures may be applied to data sets with shifting distributions. For example, where trends tests are significant, pre-shift data may be removed from the well/parameter data set for the purposes of constructing the confidence interval. “The reduction in sample size will often be more than offset by the gain in statistical power. More recent measurements may exhibit less variation around the shifted mean value, resulting in a shorter confidence interval” (USEPA, 2009).

Another alternative is to construct confidence bands around the trend line to track progress towards exceeding or meeting a fixed standard. As suggested in the Unified Guidance (Chapter 22), if a trend is present, a 90% confidence band (upper 95% confidence limit) is placed on the linear trend line. If the upper 95% confidence limit on the trend line falls below the GWPS, the well is found to have reduced to levels statistically below the GWPS.

As the discussed in the Unified Guidance, “inferences concerning a linear regression are generally appropriate when two conditions hold: 1) the residuals from the regression are approximately normal or at least reasonably symmetric in distribution; and 2) a plot of residuals versus concentrations indicates a scatter cloud of essentially uniform vertical thickness or width.” These conditions are assessed through normal probability plots of the regression residuals and plots of residuals against the predicted concentrations.

Data Adjustments Due to Exiting Corrective Action

When analyte/well pairs exit corrective action and return to assessment constituents, the hypothesis testing structure is reversed again. In corrective action mode, compliance point concentrations were presumed to exceed the GWPS, and evidence must be presented to demonstrated regulatory compliance (i.e., UCLs below the GWPS for three consecutive years). With the return to assessment constituents, analyte/well pairs have demonstrated regulatory compliance. The hypothesis testing structure reverts to the assessment monitoring structure where compliance point concentrations are presumed to not exceed the GWPS unless sampling

data indicates otherwise (i.e., LCL is above the GWPS). With this reversion in hypothesis, the focus shifts to evaluating concentration changes in the analyte/well pair that would indicate an increase over the GWPS and re-trigger corrective action. For constituents with historical SSLs, earlier concentrations that had previously triggered corrective action are no longer providing useful information regarding the current assessment monitoring hypothesis. Retaining the historical data during the timeframe in which the GWPS was exceeded will result in the regression or confidence interval methods being slower to respond to new increases. As a result, the historical data prior to when statistical compliance with the GWPS was first achieved will be removed when analyte/well pairs exit corrective action and return to assessment constituents.

Job Narrative
310-320370-1

The analytical test results presented in this report meet all requirements of the associated regulatory program listed on the Accreditation/Certification Summary Page, unless otherwise noted. Data qualifiers and/or narrative comments are included to explain any exceptions, if applicable. Regulated compliance samples (e.g. SDWA, NPDES) must comply with associated agency requirements/permits.

- Matrix-specific batch QC (e.g., MS, MSD, SD) may not be reported when insufficient sample volume is available or when site-specific QC samples are not submitted. In such cases, a Laboratory Control Sample Duplicate (LCSD) may be analyzed to provide precision data for the batch.
- For samples analyzed using surrogate and/or isotope dilution analytes, any recoveries falling outside of established acceptance criteria are re-prepared and/or re-analyzed to confirm results, unless the deviation is due to sample dilution or otherwise explained in the case narrative.

Receipt
The sample was received on 11/12/2025 4:30 PM. Unless otherwise noted below, the sample arrived in good condition, and, where required, properly preserved and on ice. The temperature of the cooler at receipt time was 0.7°C.

GC/MS VOA
Method 8260D: The continuing calibration verification (CCV) associated with batch 310-473627 recovered above the upper control limit for Bromomethane (56%D). The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported. The associated sample is:(CCV 310-473627/4).

Method 8260D: The continuing calibration verification (CCV) associated with batch 310-473791 recovered above the upper control limit for Dichlorodifluoromethane (22%D) and Bromomethane (63%D). The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported. The associated sample is:(CCV 310-473791/4).

Method 8260D: The laboratory control sample (LCS) for analytical batch 310-473791 recovered outside control limits for the following analytes: Bromomethane. These analytes were biased high in the LCS and were not detected in the associated samples; therefore, the data have been reported.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

GC/MS Semi VOA
Method 8270E: The continuing calibration verification (CCV) associated with batch 310-473905 recovered above the upper control limit for 2-Nitrophenol(23%D). The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported. The associated sample is:(CCV 310-473905/3).

Method 8270E: The continuing calibration verification (CCV) associated with batch 310-474293 recovered above the upper control limit for Benzo(k)fluoranthene(25%D) and Hexachloropropene(22%D). The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported. The associated sample is:(CCV 310-474293/3).

Method 8270E: The continuing calibration verification (CCV) analyzed in batch 310-474293 was outside the method criteria for the following analyte(s): Bis(2-ethylhexyl) phthalate(-24%D) and p-Dimethylamino azobenzene(-23%D). A CCV standard at or below the reporting limit (RL) was analyzed with the affected samples and found to be acceptable. As indicated in the reference method, sample analysis may proceed; however, any detection for the affected analyte(s) is considered estimated.

Method 8270E: The laboratory control sample and/or the laboratory control sample duplicate (LCS/LCSD) for preparation batch 310-473723 and analytical batch 310-474293 recovered outside control limits for the following analyte(s): Methapyrilene and 1,4-phenylenediamine. Methapyrilene and 1,4-phenylenediamine have been identified as a poor performing analyte when analyzed using this method; therefore, re-extraction/re-analysis was not performed.

Method 8270E: The laboratory control sample (LCS) for preparation batch 310-473723 and analytical batch 310-474293 recovered outside acceptance limits for Pyridine. There was insufficient sample and holding-time to perform a re-extraction or re-analysis; therefore, the data have been reported.

Method 8270E: The RPD of the laboratory control sample (LCS) and laboratory control sample duplicate (LCSD) for preparation batch 310-473723 and analytical batch 310-474293 recovered outside control limits for the following analytes: 3,3'-

Dimethylbenzidine, Methapyrilene, 4-Nitrophenol, Phenol, 1,4-phenylenediamine and Pyridine.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Herbicides
Method 8151A: The following sample was diluted due to the nature of the sample matrix: CRLCSWA1_Leachate_25_11 (310-320370-1). Elevated reporting limits (RLs) are provided.

Method 8151A: The continuing calibration verification (CCV) associated with batch 500-843799 recovered above the upper control limit for Silvex (2,4,5-TP). The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported. The associated sample is:(CCV 500-843799/20).

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

PCBs
No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Pesticides
No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Metals
Method 6020B: The laboratory control sample (LCS) for preparation batch 310-473632 and analytical batch 310-474577 recovered outside control limits for the following analytes: Silver. These analytes were biased high in the LCS and were not detected in the associated samples; therefore, the data have been reported.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

General Chemistry
Method 3500_CR_B - Dissolved: The matrix spike / matrix spike duplicate (MS/MSD) recoveries for Analytical Batch 473496 were outside control limits for one or more analytes. See QC Sample Results for detail. Sample matrix interference and/or non-homogeneity are suspected because the associated laboratory control sample (LCS) recovery is within acceptance limits.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
*+	LCS and/or LCSD is outside acceptance limits, high biased.
F1	MS and/or MSD recovery exceeds control limits.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

GC/MS Semi VOA

Qualifier	Qualifier Description
*-	LCS and/or LCSD is outside acceptance limits, low biased.
*1	LCS/LCSD RPD exceeds control limits.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Metals

Qualifier	Qualifier Description
*+	LCS and/or LCSD is outside acceptance limits, high biased.
4	MS, MSD: The analyte present in the original sample is greater than 4 times the matrix spike concentration; therefore, control limits are not applicable.
F1	MS and/or MSD recovery exceeds control limits.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

General Chemistry

Qualifier	Qualifier Description
4	MS, MSD: The analyte present in the original sample is greater than 4 times the matrix spike concentration; therefore, control limits are not applicable.
B	Compound was found in the blank and sample.
E	Result exceeded calibration range.
F1	MS and/or MSD recovery exceeds control limits.
F3	Duplicate RPD exceeds the control limit
HF	Parameter with a holding time of 15 minutes. Test performed by laboratory at client's request. Sample was analyzed outside of hold time.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
☼	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present

Glossary (Continued)

Abbreviation	These commonly used abbreviations may or may not be present in this report.
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Surrogate Summary

Client: Foth Infrastructure & Environment, LLC
Job ID: 310-320370-1
Project/Site: CRLCSWA 1 - Leachate

Method: 8260D - Volatile Organic Compounds by GC/MS

Matrix: Wastewater — **Prep Type: Total/NA**

		Percent Surrogate Recovery (Acceptance Limits)		
		DBFM	TOL	BFB
Lab Sample ID	Client Sample ID	(76-130)	(80-120)	(80-120)

Cooler/Sample Receipt and Temperature Log Form

Client Information

Client: Foth- I+E

City/State. CITY | STATE | Project:

Receipt Information

Date/Time Received: DATE 11/12/25 | TIME 1630 | Received By: JR

Delivery Type: ☐ UPS ☐ FedEx ☐ FedEx Ground ☐ US Mail ☐ Spee-Dee
☑ Lab Courier ☐ Lab Field Services ☐ Client Drop-off ☐ Other: _____

Condition of Cooler/Containers

Sample(s) received in Cooler? ☑ Yes ☐ No *If yes.* Cooler ID:

Multiple Coolers? ☐ Yes ☑ No *If yes* Cooler # _____ of _____

Cooler Custody Seals Present? ☑ Yes ☐ No *If yes* Cooler custody seals intact? ☑ Yes ☐ No

Sample Custody Seals Present? ☐ Yes ☑ No *If yes* Sample custody seals intact? ☐ Yes ☐ No

Trip Blank Present? ☐ Yes ☑ No *If yes* Which VOA samples are in cooler? ↓

Temperature Record

Coolant: ☑ Wet ice ☐ Blue ice ☐ Dry ice ☐ Other. _____ ☐ NONE

Thermometer ID: B3 | Correction Factor (°C): 0

• **Temp Blank Temperature** – If no temp blank, or temp blank temperature above criteria, proceed to Sample Container Temperature

Uncorrected Temp (°C) 0.7 | Corrected Temp (°C) 0.7

• **Sample Container Temperature**

	CONTAINER 1	CONTAINER 2
Container(s) used		
Uncorrected Temp (°C):		
Corrected Temp (°C).		

Exceptions Noted

1) If temperature exceeds criteria, was sample(s) received same day of sampling? ☐ Yes ☐ No
   a) *If yes:* Is there evidence that the chilling process began? ☐ Yes ☐ No

2) If temperature is <0°C, are there obvious signs that the integrity of sample containers is compromised? (e.g , bulging septa, broken/cracked bottles, frozen solid?) ☐ Yes ☐ No

NOTE If yes, contact PM before proceeding If no, proceed with login
