Good afternoon, I am checking in to see if you have any comments regarding the proposed change in sampling at the JDDW Landfill as described below.

We will be performing semiannual sampling this April (correction made below).

Please feel free to give me a call if you have questions.

Thank you,

Erica Lawson, PE (WI)

Hello, attached is the 2025 Annual Water Quality Report for the John Deere Dubuque Works Landfill.

John Deere has been voluntarily sampling the underliner liquid from both stages of the landfill since Fall of 2023 to better understand the composition of the underliner liquid and evaluate the leachate collection system. The semiannual sampling events have provided consistent data that indicates that the underliner liquid from each stage is primarily composed of leachate from that stage. This finding is consistent with the function of the underliner being secondary containment. As such, continued sampling of the underliner liquid is no longer necessary.

We are requesting Iowa DNR's concurrence with this change prior to the next sampling event, which will occur in ~~March~~ April of 2026.

The leachate sample results will continue to be used for comparing to groundwater sample results in the evaluation of groundwater quality impacts from the landfill.

Thank you,

**Erica Lawson, PE (WI)**
