Accreditation/Certification Summary

Client: Winneshiek Co Solid Waste
Project/Site: Winneshiek County Sanitary Landfill

Job ID: 310-318534-1
SDG: 25W024.00

Laboratory: Eurofins Cedar Falls

Unless otherwise noted, all analytes for this laboratory were covered under each accreditation/certification below.

Authority	Program	Identification Number	Expiration Date
Iowa	State	007	12-01-25

The following analytes are included in this report, but the laboratory is not certified by the governing authority. This list may include analytes for which the agency does not offer certification.

Analysis Method	Prep Method	Matrix	Analyte
8260D		Water	1,2,4-Trichlorobenzene
8260D		Water	Allyl chloride
8260D		Water	Ethyl methacrylate
8260D		Water	m,p-Xylene
8260D		Water	o-Xylene
SM 1030E		Water	Anion/Cation Balance

Laboratory: Eurofins Cleveland

All accreditations/certifications held by this laboratory are listed. Not all accreditations/certifications are applicable to this report.

Cooler/Sample Receipt and Temperature Log Form

Client Information

Client: Foth

City/State. CITY: STATE: IA Project:

Receipt Information

Date/Time Received: DATE 10/21/25 TIME 1800 Received By: N

Delivery Type: ☐ UPS ☐ FedEx ☐ FedEx Ground ☐ US Mail ☐ Spee-Dee
☐ Lab Courier ☐ Lab Field Services ☒ Client Drop-off ☐ Other:_____

Condition of Cooler/Containers

Sample(s) received in Cooler? ☒ Yes ☐ No *If yes:* Cooler ID:

Multiple Coolers? ☒ Yes ☐ No *If yes:* Cooler # 1 of 4

Cooler Custody Seals Present? ☐ Yes ☒ No *If yes:* Cooler custody seals intact? ☐ Yes ☐ No

Sample Custody Seals Present? ☐ Yes ☒ No *If yes:* Sample custody seals intact? ☐ Yes ☐ No

Trip Blank Present? ☐ Yes ☒ No *If yes:* Which VOA samples are in cooler? ↓

Temperature Record

Coolant: ☒ Wet ice ☐ Blue ice ☐ Dry ice ☐ Other:_____ ☐ NONE

Thermometer ID: R Correction Factor (°C): +0.0

• **Temp Blank Temperature** – If no temp blank, or temp blank temperature above criteria, proceed to Sample Container Temperature

Uncorrected Temp (°C): 0.4 Corrected Temp (°C): 0.4

• **Sample Container Temperature**

Container(s) used:	CONTAINER 1	CONTAINER 2
Uncorrected Temp (°C):		
Corrected Temp (°C):		

Exceptions Noted

1) If temperature exceeds criteria, was sample(s) received same day of sampling? ☐ Yes ☐ No
   a) *If yes:* Is there evidence that the chilling process began? ☐ Yes ☐ No

2) If temperature is <0°C, are there obvious signs that the integrity of sample containers is compromised? (e g., bulging septa, broken/cracked bottles, frozen solid?) ☐ Yes ☐ No

NOTE If yes, contact PM before proceeding If no, proceed with login

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	N/A	
Sample custody seals, if present, are intact.	N/A	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

Question	Answer	Comment
The cooler's custody seal is intact.	N/A	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature acceptable,where thermal pres is required(</=6C, not frozen).	True	
Cooler Temperature is recorded.	True	
WV:Container Temp acceptable,where thermal pres is required (</=6C, not frozen).	N/A	
WV: Container Temperature is recorded.	N/A	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
There are no discrepancies between the containers received and the COC.	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
There is sufficient vol. for all requested analyses.	True	
Is the Field Sampler's name present on COC?	False	Received project as a subcontract.
Sample custody seals are intact.	N/A	
VOA sample vials do not have headspace >6mm in diameter (none, if from WV)?	N/A

Job Notes

This report may not be reproduced except in full, and with written approval from the laboratory. The results relate only to the samples tested. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

The test results in this report relate only to the samples as received by the laboratory and will meet all requirements of the methodology, with any exceptions noted. This report shall not be reproduced except in full, without the express written approval of the laboratory. All questions should be directed to the Eurofins Environment Testing North Central, LLC Project Manager.

Job Narrative
310-318779-1

The analytical test results presented in this report meet all requirements of the associated regulatory program listed on the Accreditation/Certification Summary Page, unless otherwise noted. Data qualifiers and/or narrative comments are included to explain any exceptions, if applicable. Regulated compliance samples (e.g. SDWA, NPDES) must comply with associated agency requirements/permits.

- Matrix-specific batch QC (e.g., MS, MSD, SD) may not be reported when insufficient sample volume is available or when site-specific QC samples are not submitted. In such cases, a Laboratory Control Sample Duplicate (LCSD) may be analyzed to provide precision data for the batch.
- For samples analyzed using surrogate and/or isotope dilution analytes, any recoveries falling outside of established acceptance criteria are re-prepared and/or re-analyzed to confirm results, unless the deviation is due to sample dilution or otherwise explained in the case narrative.

Receipt
The samples were received on 10/23/2025 3:10 PM. Unless otherwise noted below, the samples arrived in good condition, and, where required, properly preserved and on ice. The temperatures of the 7 coolers at receipt time were 0.4°C, 0.9°C, 1.6°C, 1.8°C, 2.1°C, 3.4°C and 3.6°C.

GC/MS VOA
Method 8260D: The initial calibration verification (ICV) result for batch 310-472433 was above the upper control limit. The affected analytes are: Vinyl acetate. Sample results were non-detects, and have been reported as qualified data.

Method 8260D: The method requirement for no headspace was not met. The following volatile sample was analyzed with headspace in the sample container: MW-29A_25_10 (310-318779-5).

Method 8260D: The continuing calibration verification (CCV) associated with batch 310-471555 recovered outside of the control limits for Bromomethane (-25%D). A CCV standard at or below the reporting limit (RL) was analyzed with the affected samples and found to be acceptable. The samples associated with this CCV were non-detects for the affected analyte; therefore, the data have been reported. The associated sample is impacted: (CCV 310-471555/4).

Method 8260D: The continuing calibration verification (CCV) associated with batch 310-471692 recovered outside of the control limits for Xylenes, Total (-21%D) and o-Xylene (-24%D). The LCS associated with this CCV passed CCV criteria for the affected analytes; therefore, the data have been reported. The associated sample is:(CCV 310-471692/3).

Method 8260D: The continuing calibration verification (CCV) associated with batch 310-471692 recovered outside of the control limits for Chlorodibromomethane (-23%D). A CCV standard at or below the reporting limit (RL) was analyzed with the affected samples and found to be acceptable. The samples associated with this CCV were non-detects for the affected analyte; therefore, the data have been reported. The associated sample is impacted: (CCV 310-471692/3).

Method 8260D: The continuing calibration verification (CCV) associated with batch 310-471692 recovered outside of the control limits for Chloroethane (-26%D), Dichlorodifluoromethane (-24%D), Chloromethane (-24%D), and Trichlorofluoromethane (-24%D). The LCS associated with this CCV passed CCV criteria for the affected analytes; therefore, the data have been reported. The associated sample is:(CCV 310-471692/4).

Method 8260D: The continuing calibration verification (CCV) associated with batch 310-471692 recovered outside of the control limits for Bromomethane (-33%D). A CCV standard at or below the reporting limit (RL) was analyzed with the affected samples and found to be acceptable. The samples associated with this CCV were non-detects for the affected analyte; therefore, the data have been reported. The associated sample is impacted: (CCV 310-471692/4).

Method 8260D: Surrogate recovery for the following sample was outside the upper control limit: MW-44A_25_10 (310-318779-9). This sample did not contain any target analytes; therefore, re-analysis was not performed.

Method 8260D: Internal standard (ISTD) response for the following method blank was outside of acceptance limits: (MB 310-471301/7). The sample was not re-analyzed due to holding time expired. The internal standard failed low which creates a high bias, and all analytes were non-detects. Therefore, the data have been reported.

Method 8260D: Internal standard (ISTD) response for the following sample was outside of acceptance limits: MW-44A_25_10

(310-318779-9). The sample was not re-analyzed due to holding time expired. The internal standard failed low which creates a high bias, and all analytes were non-detects. Therefore, the data have been reported.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

GC/MS Semi VOA
Method 8270E: The continuing calibration verification (CCV) analyzed in batch 310-472246 was outside the method criteria for the following analyte(s): Di-n-octyl phthalate(-30%D), Famphur(-82%D) and 1,4-phenylenediamine(-80%D). A CCV standard at or below the reporting limit (RL) was analyzed with the affected samples and found to be acceptable. As indicated in the reference method, sample analysis may proceed; however, any detection for the affected analyte(s) is considered estimated.

Method 8270E: The laboratory control sample and/or the laboratory control sample duplicate (LCS/LCSD) for preparation batch 310-471206 and analytical batch 310-472246 recovered outside control limits for the following analyte(s): 1,4-phenylenediamine. 1,4-phenylenediamine have been identified as a poor performing analyte when analyzed using this method; therefore, re-extraction/re-analysis was not performed.

Method 8270E: The RPD of the laboratory control sample (LCS) and laboratory control sample duplicate (LCSD) for preparation batch 310-471206 and analytical batch 310-472246 recovered outside control limits for the following analytes: 2-Acetylaminofluorene, Kepone and Methapyrilene.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

GC Semi VOA
No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Herbicides
Method 8151A: Surrogate recovery for the following sample was outside the upper control limit: MW-46A_25_10 (310-318779-11). This sample did not contain any target analytes; therefore, re-extraction and/or re-analysis was not performed.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

PCBs
No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Pesticides
No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Metals
Method 6020B: The laboratory control sample (LCS) and CCV for preparation batch 310-471618 and analytical batch 310-472466 recovered outside control limits for the following analytes: thallium. These analytes were biased high in the LCS and CCV and were not detected in the associated samples; therefore, the data have been reported.

Method 6020B: The continuing calibration verification (CCV) associated with batch 310-472611 recovered above the upper control limit for thallium. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

General Chemistry
No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Client: Winneshiek Co Solid Waste
Job ID: 310-318779-1
Project/Site: Winneshiek County Sanitary Landfill

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
*3	ISTD response or retention time outside acceptable limits.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
S1+	Surrogate recovery exceeds control limits, high biased.

GC/MS Semi VOA

Qualifier	Qualifier Description
*-	LCS and/or LCSD is outside acceptance limits, low biased.
*1	LCS/LCSD RPD exceeds control limits.
E	Result exceeded calibration range.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

GC Semi VOA

Qualifier	Qualifier Description
p	The %RPD between the primary and confirmation column/detector is >40%. The lower value has been reported.
S1+	Surrogate recovery exceeds control limits, high biased.

Metals

Qualifier	Qualifier Description
*+	LCS and/or LCSD is outside acceptance limits, high biased.
^+	Continuing Calibration Verification (CCV) is outside acceptance limits, high biased.
4	MS, MSD: The analyte present in the original sample is greater than 4 times the matrix spike concentration; therefore, control limits are not applicable.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

General Chemistry

Qualifier	Qualifier Description
B	Compound was found in the blank and sample.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
☼	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present

Glossary (Continued)

Abbreviation	These commonly used abbreviations may or may not be present in this report.
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Accreditation/Certification Summary

Client: Winneshiek Co Solid Waste
Job ID: 310-318779-1
Project/Site: Winneshiek County Sanitary Landfill

Laboratory: Eurofins Cedar Falls

Unless otherwise noted, all analytes for this laboratory were covered under each accreditation/certification below.

Authority	Program	Identification Number	Expiration Date
Iowa	State	007	12-01-25

The following analytes are included in this report, but the laboratory is not certified by the governing authority. This list may include analytes for which the agency does not offer certification.

Analysis Method	Prep Method	Matrix	Analyte
8260D		Water	1,2,4-Trichlorobenzene
8260D		Water	Allyl chloride
8260D		Water	Ethyl methacrylate
8260D		Water	m,p-Xylene
8260D		Water	o-Xylene
SM 1030E		Water	Anion/Cation Balance

Laboratory: Eurofins Cleveland

All accreditations/certifications held by this laboratory are listed. Not all accreditations/certifications are applicable to this report.

Cooler/Sample Receipt and Temperature Log Form

Client Information

Client: Winneshiek County Landfill

City/State: CITY | STATE | Project:

Receipt Information

Date/Time Received: DATE 10-23-25 | TIME 1510 | Received By: CGC

Delivery Type: ☐ UPS ☐ FedEx ☐ FedEx Ground ☐ US Mail ☐ Spee-Dee ☐ Lab Courier ☐ Lab Field Services ☑ Client Drop-off ☐ Other:

Condition of Cooler/Containers

Sample(s) received in Cooler? ☑ Yes ☐ No *If yes:* Cooler ID:

Multiple Coolers? ☑ Yes ☐ No *If yes:* Cooler # 1 of 7

Cooler Custody Seals Present? ☐ Yes ☑ No *If yes:* Cooler custody seals intact? ☐ Yes ☐ No

Sample Custody Seals Present? ☐ Yes ☑ No *If yes:* Sample custody seals intact? ☐ Yes ☐ No

Trip Blank Present? ☐ Yes ☑ No *If yes.* Which VOA samples are in cooler? ↓

Temperature Record

Coolant: ☑ Wet ice ☐ Blue ice ☐ Dry ice ☐ Other: ☐ NONE

Thermometer ID: AA | Correction Factor (°C): 0

• **Temp Blank Temperature** – If no temp blank, or temp blank temperature above criteria, proceed to Sample Container Temperature

Uncorrected Temp (°C): 3.4 | Corrected Temp (°C): 3.4

• **Sample Container Temperature**

	CONTAINER 1	CONTAINER 2
Container(s) used:		
Uncorrected Temp (°C):		
Corrected Temp (°C):		

Exceptions Noted

1) If temperature exceeds criteria, was sample(s) received same day of sampling? ☐ Yes ☐ No
   a) *If yes:* Is there evidence that the chilling process began? ☐ Yes ☐ No

2) If temperature is <0°C, are there obvious signs that the integrity of sample containers is compromised? (e.g , bulging septa, broken/cracked bottles, frozen solid?) ☐ Yes ☐ No

NOTE: If yes, contact PM before proceeding If no, proceed with login

Cooler Custody Seals Present? ☐ Yes ☑ No *If yes:* Cooler custody seals intact? ☐ Yes ☐ No

Sample Custody Seals Present? ☐ Yes ☑ No *If yes:* Sample custody seals intact? ☐ Yes ☐ No

Trip Blank Present? ☑ Yes ☐ No *If yes.* Which VOA samples are in cooler? ↓

MW 2R-25-10, MW-18-25-10, MW-35_25-10

Temperature Record

Coolant: ☑ Wet ice ☐ Blue ice ☐ Dry ice ☐ Other: ☐ NONE

Thermometer ID: AA | Correction Factor (°C): 0

• **Temp Blank Temperature** – If no temp blank, or temp blank temperature above criteria, proceed to Sample Container Temperature

Uncorrected Temp (°C): 1.6 | Corrected Temp (°C): 1.6

• **Sample Container Temperature**

	CONTAINER 1	CONTAINER 2
Container(s) used:		
Uncorrected Temp (°C):		
Corrected Temp (°C):		

Exceptions Noted

1) If temperature exceeds criteria, was sample(s) received same day of sampling? ☐ Yes ☐ No
   a) *If yes:* Is there evidence that the chilling process began? ☐ Yes ☐ No

2) If temperature is <0°C, are there obvious signs that the integrity of sample containers is compromised? (e.g , bulging septa, broken/cracked bottles, frozen solid?) ☐ Yes ☐ No

NOTE If yes, contact PM before proceeding If no, proceed with login

Data Validation Report

Project Name:	Winneshiek County Sanitary Landfill – Decorah, IA (25W024.00)
Task Name:	25W024_25_10
Data Set Description:	Fall 2025 Groundwater Event
Laboratory(s):	Eurofins – Cedar Falls, IA; Cleveland, OH; and Lancaster, PA
Laboratory Sample Delivery Group (SDG) ID(s):	310-318534-1 and 310-318779-1
Sample Collection Dates:	10/20/2025 – 10/22/2025
Sample Analysis Dates:	10/232/2025 – 11/6/2025
Sample Matrices:	Groundwater
Sample IDs Reviewed:	See Table 1
Verification and Validation Stage, 100% data:	☐ 1 ☒ 2A ☐ 2B ☐ 3 ☐ 4
Verified and Validated By:	Hannah Dubbs, Project Environmental Scientist 12/3/2025

The analytical data were validated to verify that laboratory quality assurance and quality control (QA/QC) procedures were documented and to evaluate the overall quality of the data reported. Analytical reports include 26 investigative groundwater samples collected via low-flow or no-purge sampling techniques at the Winneshiek County Sanitary Landfill from October 20 through October 22, 2025; samples are listed in Table 1. The data were collected in accordance with the *Winneshiek Hydrologic Monitoring System Plan* (AECOM, 2024), Iowa Department of Natural Resources (IDNR) Sanitary Disposal Closure Permit Number 96-SDP-01-74, and 567 Iowa Administrative Code (IAC) 113.10.

Validation Summary

Stage 2A data validation was performed on 100% of the data from these SDGs, with review tasks and items of note documented in the summary table below.

Validation Task and Description	Review Notes	Action
Chain of Custody (COC) and Sample Receipt Form Confirm relinquish & receipt signatures. Confirm parameters and analytical methods match COC and Hydrologic Monitoring System Plan (HMSP).	All appropriate relinquish and receipt signatures were present . Parameters and analytical methods analyzed match the COC and current sampling program.	Not applicable
	Eurofins inadvertently labeled sample MW-1_25_10 as MW_1_25_10 in laboratory report 310-318534-1. Foth did not request a revised report. The sample name will be corrected in the laboratory electronic data deliverable (EDD) prior to data upload.	Mislabeled sample ID will be updated in the lab EDD prior to data upload.
	Potassium was reported for MW-1_25_10, MW-3_25_10, MW-4B_25_10, MW-19R_25_10, MW-25A_25_10, MW-31A_25_10, MW-33A_25_10, MW-34A_25_10, MW-37A_25_10, MW-38A_25_10, MW-40A_25_10, MW-41A_25_10, MW-42A_25_10, and FD-2 in laboratory report 310-318534-1; calcium, magnesium, and sodium were reported for EB-2_25_10, FD-1_25_10, FD-2_25_10, and FD-3_25_10 in	Not applicable

Validation Task and Description	Review Notes	Action
COC Continued	laboratory reports 310-318534-1 and 310-318779-1; and tin was reported for FD-2_25_10 in laboratory report 310-318534-1 when they were not requested on the COC. Since these are additional parameters, no further action is required.	See above
Case Narrative Review for items noted by the laboratory that may impact the validation process.	The case narrative for 310-318779-1 indicated that volatile organic analysis (VOA) vials for MW-29A_25_10 were analyzed with headspace. According to the *National Functional Guidelines for Organic Superfund Methods Data Review* (USEPA, 2020a) for volatile organic compounds (VOCs), proper preservation includes the absence of headspace. Professional judgment was utilized to qualify the non-detect VOC results in MW-29A_25_10 as UJ. Resampling is not recommended, as VOCs have historically not been detected at MW-29A. The case narrative for 310-318534-1 indicated that the unseeded control blank (USB) dilution water dissolved oxygen depletion was greater than 0.2 milligrams per liter (mg/L). Guidance is not provided in the *National Functional Guidelines for Organic Superfund Methods Data Review* (USEPA, 2020a) for biochemical oxygen demand (BOD). Professional judgement was utilized to qualify the detects J and non-detects UJ. Resampling is not recommended since BOD is not a required parameter according to the *Winneshiek Hydrologic Monitoring System Plan* (AECOM, 2024), the Permit, and 567 IAC 113.10. The remaining quality control issues noted in the case narratives were reviewed and found acceptable. Issues either were addressed in the comments below; had no impact on investigative samples; were corrected/qualified by the laboratory; or were outside of the modified Stage 2A validation scope, which will be submitted with the updated Hydrologic Monitoring System Plan. No additional actions are required.	Qualifiers assigned; Resampling not recommended Qualifiers assigned; Resampling not recommended Not applicable
Sample Condition Upon Receipt (SCUR) Confirm samples in acceptable condition and no discrepancies noted. Confirm preservation meets method requirements.	With the exception identified below, samples were received by Eurofins – Cedar Falls, IA in acceptable conditions. In addition, the sulfide and herbicide sample shipments from Eurofins – Cedar Falls, IA to Eurofins – Cleveland, OH and Eurofins – Lancaster, PA, respectively, were received in acceptable conditions. As detailed in the Case Narrative Review Notes, the VOA vials for MW-29A_25_10 were analyzed with headspace; therefore, the non-detect VOC results were qualified UJ. Resampling was not recommended.	Not applicable Qualifiers assigned; resampling not recommended

Validation Task and Description	Review Notes	Action
Methods Requested Confirm methods match project requirements and lab provided all methods ordered.	The methods ordered and analyzed were performed in accordance with the project requirements. Methods include United States Environmental Protection Agency (USEPA) 8260D VOCs, USEPA 8270E Semivolatile Organic Compounds (SVOCs), USEPA 8015C Nonhalogenated Organics, USEPA 8151A Herbicides, USEPA 8081B Organochlorine Pesticides, USEPA 8082A Polychlorinated Biphenyls (PCBs), USEPA 8151A Herbicides, USEPA 6020B Total Metals, USEPA 7470A Mercury, USEPA 353.2 Nitrogen, Nitrate, Standard Method (SM) 4500 F C-2011 Fluoride, 9012B Cyanide, USEPA 9034 Sulfide, Advancing Standards Transforming Markets (ASTM) D516-16 Sulfate, United States Geological Survey (USGS) I-3765-85 Total Suspended Solids (TSS), SM 1030E Cation Anion Balance, SM 2320B Alkalinity, SM 2540C Total Dissolved Solids (TDS), SM 4500 CL-E Total Chloride, SM 5210B BOD, and SM 5220D Chemical Oxygen Demand (COD).	Not applicable
Analytes Requested Confirm analytes ordered match project requirements and lab provided all analytes ordered.	The analytes requested were analyzed in accordance with the project requirements. The laboratory provided all analytes ordered. As detailed in the COC and Sample Receipt Form Review Notes, the following analytes were reported when not requested on the COC: potassium was reported for MW-1_25_10, MW-3_25_10, MW-4B_25_10, MW-19R_25_10, MW-25A_25_10, MW-31A_25_10, MW-33A_25_10, MW-34A_25_10, MW-37A_25_10, MW-38A_25_10, MW-40A_25_10, MW-41A_25_10, MW-42A_25_10, and FD-2 in laboratory report 310-318534-1; calcium, magnesium, and sodium were reported for EB-2_25_10, FD-1_25_10, FD-2_25_10, and FD-3_25_10 in laboratory reports 310-318534-1 and 310-318779-1; and tin was reported for FD-2_25_10 in laboratory report 310-318534-1.	Not applicable Not applicable
Holding Times Confirm laboratory performed extractions and analyses within method-required holding times.	Eurofins performed analysis within the method-required holding times with the exceptions below. <u>310-318534-1</u> Analysis for nitrate per USEPA 353.2 is required to be analyzed within 48 hours of sampling for non-preserved samples. MW-3_25_10, MW-4B_25_10, MW-31A_25_10, MW-33A_25_10, MW-34A_25_10, MW-37A_25_10, MW-38A_25_10, MW-40A_25_10, MW-41A_25_20, MW-42_25_10 were analyzed outside the 48-hour holding time. In accordance with the *National Functional Guidelines for Inorganic Superfund Methods Data Review* (USEPA, 2020b) for anions, when samples are analyzed outside the 48-hour hold time, detected results are qualified J- and non-detects are rejected (qualified R). Resampling is not recommended for these wells since nitrate is not a required parameter according to the *Winneshiek Hydrologic Monitoring System Plan* (AECOM, 2024), the Permit, and 567 IAC 113.10. Analysis for sulfide per USEPA Method 9034 is required to be extracted within 7 days of sampling and analyzed within 7 days of extraction. EB-1_25_10 was extracted outside the 7-day holding time, but analyzed within 7 days of extraction. The sample exceeded the 7-day extraction time by approximately 1 hour. No guidance is provided in the *National Functional Guidelines for Inorganic Superfund Methods Data Review* (USEPA, 2020b) for sulfide analysis. However,	Qualifiers assigned, resampling not recommended No qualifiers assigned, resampling not recommended

Validation Task and Description	Review Notes	Action
Hold Times Continued	professional judgment was utilized not to qualify the non-detect sulfide results in EB-1_25_10 since the extraction holding time for sulfide was only slightly exceeded. Resampling for EB-1 is not applicable since it is a quality control sample. 310-318779-1 Analysis for nitrate per USEPA 353.2 is required to be analyzed within 48 hours of sampling for non-preserved samples. MW-2R_25_10, MW-4_25_10, MW-7A_25_10, MW-18_25_10, MW-29A_25_10, MW-35_25_10, MW-39A_25_10, MW-43A_25_10, MW-44A_25_10, MW-45A_25_10, MW-46A_25_10, SW-2_25_20, SW-5_25_10 were analyzed outside the 48-hour holding time. In accordance with the *National Functional Guidelines for Inorganic Superfund Methods Data Review* (USEPA, 2020b) for anions, when samples are analyzed outside the 48-hour hold time, detected results are qualified J- and non-detects are rejected (qualified R). Resampling is not recommended for these wells since nitrate is not a required parameter according to the *Winneshiek Hydrologic Monitoring System Plan* (AECOM, 2024), the Permit, and 567 IAC 113.10. Analysis for VOCs per USEPA Method 8260D is required to be analyzed within 7 days of sampling if unpreserved and within 14 days if preserved. For MW-44A_25_10, acrylonitrile, which was analyzed from the unpreserved VOA vials, was analyzed within the 7-day hold time. The remaining VOC parameters analyzed at MW-44A_25_10 were analyzed outside the 14-day hold time by approximately 4 hours. In accordance with the *National Functional Guidelines for Organic Superfund Methods Data Review* (USEPA, 2020a), when VOC samples are analyzed outside the 14-day hold time for preserved samples, non-detects are rejected (qualified R). Professional judgment was utilized not to qualify the non-detect VOC results in MW-44A_25_10 since the holding time for VOCs was only slightly exceeded. Resampling is not recommended since the analysis hold times were only slightly exceeded, the results were not rejected, and VOCs have not been detected at MW-44A previously. Analysis for VOCs per USEPA Method 8260D is required to be analyzed within 7 days of sampling if unpreserved and within 14 days if preserved. For SW-2_25_20 and SW-5_25_10, acrylonitrile, which was analyzed from the unpreserved VOA vials, was analyzed outside the 7-day hold time by less than 1 hour. The remaining VOC parameters analyzed at SW-2_25_20 and SW-5_25_10 were analyzed within the 14-day hold time. In accordance with the National Functional Guidelines for Organic Superfund Methods Data Review (USEPA, 2020a), when VOC samples are analyzed outside the 7-day hold time for unpreserved samples, non-detects are rejected (qualified R). Professional judgment was utilized not to qualify the non-detect acrylonitrile results in SW-2_25_20 and SW-5_25_10 since the holding time for VOCs was only slightly exceeded. Resampling is not recommended since the analysis hold times were only slightly	See above Qualifiers assigned, resampling not recommended No qualifiers assigned, resampling not recommended No qualifiers assigned, resampling not recommended

Validation Task and Description	Review Notes	Action
Hold Times Continued	exceeded, the results were not rejected, and VOCs have not been detected at SW-2 and SW-5 previously. Analysis for herbicides per USEPA Method 8151A is required to be extracted within 7 days of sampling and analyzed within 40 days of extraction. FD-1_25_10 and MW-7A_25_10 were extracted outside the 7-day holding time, but analyzed within the 40-day holding time. Samples exceeded the 7-day extraction hold time by approximately 1 hour. In accordance with the National Functional Guidelines for Organic Superfund Methods Data Review (USEPA, 2020a), when herbicide samples are extracted outside the 7-day hold time and analyzed outside or within the 40-day holding time, non-detects are rejected (qualified R). Professional judgment was utilized not to qualify the non-detect herbicide results in FD-1_25_10 and MW-7A_25_10 since the extraction holding times for herbicides were only slightly exceeded. Resampling is not recommended for MW-7A since the extraction hold time was only slightly exceeded, and the results were not rejected. Resampling for FD-1 is not applicable since it is a quality control sample. Analysis for sulfide per USEPA Method 9034 is required to be extracted within 7 days of sampling and analyzed within 7 days of extraction. FD-1_25_10 and MW-29A_25_10 were extracted outside the 7-day holding time, but analyzed within 7 days of extraction. The samples exceeded the 7-day extraction time by approximately 1 hour. No guidance is provided in the *National Functional Guidelines for Inorganic Superfund Methods Data Review* (USEPA, 2020b) for sulfide analysis. However, professional judgment was utilized not to qualify the detected sulfide results in FD-1_25_10 and MW-29A_25_10 since the extraction holding time for sulfide were only slightly exceeded. Resampling for MW-29A_25_10 was not considered since the result was not considered for rejection. Resampling for FD-1 is not applicable since it is a quality control sample.	See above No qualifiers assigned, resampling not recommended No qualifiers assigned, resampling not recommended
Blanks Confirm no detections in laboratory method blanks, field blanks, and trip blanks.	Table 3 presents analytes detected in the method blanks. No detections were found in the equipment and trip blanks. <u>310-318534-1</u> Tin was detected in the method blank (MB 310-471283/1-A) at a concentration of 4.191 micrograms per liter (ug/L). In accordance with the *National Functional Guidelines for Inorganic Superfund Methods Data Review* (USEPA, 2020b) for inductively coupled plasma mass spectrometry (ICP-MS), when the blank concentration is greater than the method detection limit (MDL) and less than the practical quantitation limit (PQL), associated non-detect sample results are not qualified.	No qualifiers assigned
Surrogates or Deuterated Monitoring Compounds	Table 4 presents the surrogate recoveries that were outside the control limits. <u>310-318534-1</u> The toluene-d8 surrogate recoveries for MW-1_25_10 and MW-31_25_10 were above the upper acceptance limit, indicating potential	

Validation Task and Description	Review Notes	Action
Surrogates or Deuterated Monitoring Compounds Continued For *organic analyses only*, confirm surrogates analyzed and surrogate recovery within QC limits.	high bias for VOCs in these samples. In accordance with the *National Functional Guidelines for Organic Superfund Methods Data Review* (USEPA, 2020a) for VOCs, when surrogate recovery is above the recovery limit, associated detect sample results are qualified J+ and non-detects are not qualified. The 2,4-dichlorophenylacetic acid surrogate recovery for EB-1_25_10 was above the upper acceptance limit, indicating potential high bias for herbicides in the sample. In accordance with the *National Functional Guidelines for Organic Superfund Methods Data Review* (USEPA, 2020a) for herbicides, when surrogate recovery is above the recovery limit and below the expanded upper acceptance limit (200%), non-detect herbicides in the samples are not qualified. 310-318779-1 The 4-bromofluorobenzene surrogate recovery for MW44A_25_10 was above the upper acceptance limit, indicating potential high bias for VOCs in the sample. In accordance with the *National Functional Guidelines for Organic Superfund Methods Data Review* (USEPA, 2020a) for VOCs, when surrogate recovery is above the recovery limit, associated non-detect sample results are not qualified.	Qualifiers assigned No qualifiers assigned No qualifiers assigned
Field Duplicates Confirm field duplicates collected at required frequency and field duplicate RPD within acceptable limits.	Field duplicate samples were collected at a 1 per 10 frequency in accordance with the project requirements. Table 8 contains the precision evaluation of the parent/field duplicate samples. The RPDs between the investigative and field duplicate samples were within the duplicate sample validation criteria.	Not applicable

	Yes	No	
1. Method Criteria		X	Samples were collected, preserved, shipped/delivered, and analyzed within the method protocols, with the exceptions listed below. As detailed in the Case Narrative Review Notes, the VOA vials for MW-29A8_25_10 were analyzed with headspace; therefore, the non-detect VOC results were qualified UJ. As further described in the Holding Times Review Notes, there were multiple extraction and analysis hold time exceedances in SDGs 310-318534-1 and 310-318779-1. For nitrate analysis hold time exceedances, associated detected results were qualified as J-, and associated non-detected results were rejected (qualified R). Professional judgment was utilized not to qualify the remaining extraction and analysis hold time exceedance associated results. Resampling was not recommended.
2. Precision	X		Field precision was evaluated through investigative and field duplicate RPDs. The RPDs between the investigative and field duplicate samples were within the duplicate sample validation criteria.
3. Accuracy	X		Accuracy was evaluated through surrogate recovery. The percent recoveries for surrogates were within control limits with the exceptions below. As listed in Table 4, toluene-d8 surrogate recoveries for MW-1_25_10 and MW-31_25_10 were above the upper acceptance limit. Associated detected sample results were qualified J+, and non-detected sample results were not qualified. In addition, 2,4-dichlorophenylacetic acid surrogate recovery for EB-1_25_10 and 4-bromofluorobenzene surrogate recovery for MW44A_25_10 were above the recovery limits, and the associated non-detect sample results were not qualified.
4. Representativeness	X		Sampling was conducted in accordance with the sample collection procedures described in the approved HMSP, approved HMSP revisions, and SOPs.
5. Comparability	X		Collection techniques, measurement procedures, methods, and reporting were equivalent to currently approved procedures and are comparable to historical data.
6. Completeness	X		Valid analytical results exceeded 90%.
7. Suitability for Intended Use	X		No evidence of gross contamination or significant issues with the method criteria, precision, accuracy, representativeness, comparability, or completeness were identified.

Overall, the data reported are of good quality and the results for the QA/QC measurements that were used by the laboratories during the analysis of the samples were generally acceptable. Some sample results required qualification during data validation because method-specific QA/QC criteria were not met; results may be qualified for more than one reason. Qualified data are usable (unless qualified as rejected

[R]), represent data of good quality and reasonable confidence, and have an acceptable degree of uncertainty (i.e., may be less precise or less accurate than unqualified data). Table 2 provides a definition of the qualifiers that may be assigned by the validator and/or retained from the laboratory. A summary of the validation qualifiers is provided below.

- No results were qualified as non-detect at a concentration less than the reporting limit (assigned as U) and presumptive evidence of presence of an analyte (assigned as N or NJ qualifiers).
- One result (0.03%) was qualified as estimated (assigned as J).
- Three results (0.09%) were qualified as biased high (assigned J+).
- Sixteen results (0.51%) were qualified as biased low (assigned J-).
- 58 results (1.83%) were qualified as non-detect with the reporting limit an estimated value (UJ).
- Eight results (0.25%) were not usable and rejected (assigned as R qualifier).
- 99.75% of the reported data is usable for project data quality objectives.

Table 2
Explanation of Qualifiers

Qualifier	Explanation
U	The analyte was analyzed for and was not detected above the numerical quantitation limit.
J	The analyte was analyzed for and was positively identified, but the analytical result (i.e., quantitation) is an estimated value. In some cases it is recognized that the estimated value is biased high (J+) suggesting the actual value is lower than estimated; or biased low (J-) suggesting the actual value is higher than estimated.
UJ	The analyte was analyzed for and was not detected above the reporting limit, but the reporting limit is an estimated value.
R	The analyte was analyzed for but may or may not be present and/or quantifiable due to quality control issues. The analytical result is not usable and should be rejected.
N	The analysis indicates presumptive evidence of the presence of the analyte.
NJ	The analysis indicates presumptive evidence of the presence of the analyte, but the numerical value is an estimated quantity.

Notes:
Results qualified as "J" or "UJ" are of acceptable data quality and may be used quantitatively per United States Environmental Protection Agency guidelines.

Table 3
Method, Field, and Trip Blank Exceedances

Lab Report	Blank Type	Lab Sample ID	Analysis Batch	Prep Batch	Parameter	Result	Units	Lab Qualifier	MDL	PQL	Associated Samples
310-318534-1	MB	MB 310-471283/1-A	471824	471283	Tin	4.191	ug/L	J	2.50	5.00	EB-1_25_10 , FD-2_25_10

Notes:
MB = method blank
MDL = minimum detection limit
PQL = practical quantitation limit
ug/L = micrograms per liter

Table 4
Surrogate Recovery Exceedances

Lab Sample ID	Parent Sample	Parameter	Surrogate % Recovery	% Recovery Limits	
310-318534-1	MW-1_25_10	Toluene-d8	127	80	120
310-318534-14	EB-1_25_10	2,4-Dichlorophenylacetic Acid	205	34	142
310-318534-6	MW-31A_25_10	Toluene-d8	121	80	120
310-318779-9	MW-44A_25_10	4-Bromofluorobenzene	136	80	120

Notes:
% = percent

Table 5
Relative Percent Difference (RPD) Analysis for Field Duplicate Samples
Appendix II Constituents & TSS

RPD = $\dfrac{\text{absolute value (a - b)}}{\text{(a + b)/2}} \times 100\%$

Acceptance Criteria*: 35%

* Unless otherwise noted in project planning documents, the acceptance criteria for field duplicates RPD is as follows:
- For analytes with concentrations greater than 5x (2x for soil matrices) the reporting limit, the RPD should be within 35% for water matrices (50% for soil matrices).
- For analytes with either or both concentrations less than 5x (2x for soil matrices) the reporting limit (indicated below by "low-level"), the absolute difference between the sample and field duplicate should not exceed 5x the reporting limit.

Duplicate Result Analysis:

MW-44A_25_10	310-318779-9	USEPA 353.2	Nitrogen, Nitrate	0.1	U	mg/L	<0.1	R	Analytical method hold time exceeded, indicating potential low bias. Qualified R since result is non-detect.
MW-45A_25_10	310-318779-10	USEPA 353.2	Nitrogen, Nitrate	0.1	U	mg/L	<0.1	R	Analytical method hold time exceeded, indicating potential low bias. Qualified R since result is non-detect.
MW-46A_25_10	310-318779-11	USEPA 353.2	Nitrogen, Nitrate	2.36		mg/L	0.088	J-	Analytical method hold time exceeded, indicating potential low bias. Qualified J- since result is >PQL.
SW-2_25_10	310-318779-16	USEPA 353.2	Nitrogen, Nitrate	8.19		mg/L	8.19	J-	Analytical method hold time exceeded, indicating potential low bias. Qualified J- since result is >PQL.
SW-5_25_10	310-318779-17	USEPA 353.2	Nitrogen, Nitrate	6.66		mg/L	6.66	J-	Analytical method hold time exceeded, indicating potential low bias. Qualified J- since result is >PQL.
MW-1_25_10	310-318534-1	USEPA 8260	1,4-Dichlorobenzene	0.278	J	ug/L	0.278	J+	Associated surrogate recovery above the upper acceptance limit. Qualified J+ since the sample result was >MDL and <PQL.
MW-1_25_10	310-318534-1	USEPA 8260	Chlorobenzene	0.927	J	ug/L	0.927	J+	Associated surrogate recovery above the upper acceptance limit. Qualified J+ since the sample result was >MDL and <PQL.

Table 6
Qualified Results from Data Validation

Sample ID	Lab Sample ID	Method	Parameter	Result	Lab Qualifier	Units	Qualified Result	Validator Qualifier	Explanation
MW-31A_25_10	310-318534-6	USEPA 8260	1,1-Dichloroethane	0.916	J	ug/L	0.916	J+	Associated surrogate recovery above the upper acceptance limit. Qualified J+ since the sample result was >MDL and <PQL.

Notes:
This table only lists validator qualified data. Not all laboratory qualified data are listed; only the laboratory qualified data that was validator qualified are included.
> = greater than
< = less than
MDL = minimum detection limit
mg/L - milligrams per liter
PQL = practical quantitation limit
ug/L = micrograms per liter
USB = unseeded control blank
USEPA = United States Environmental Protection Agency
VOA = volatile organic analysis

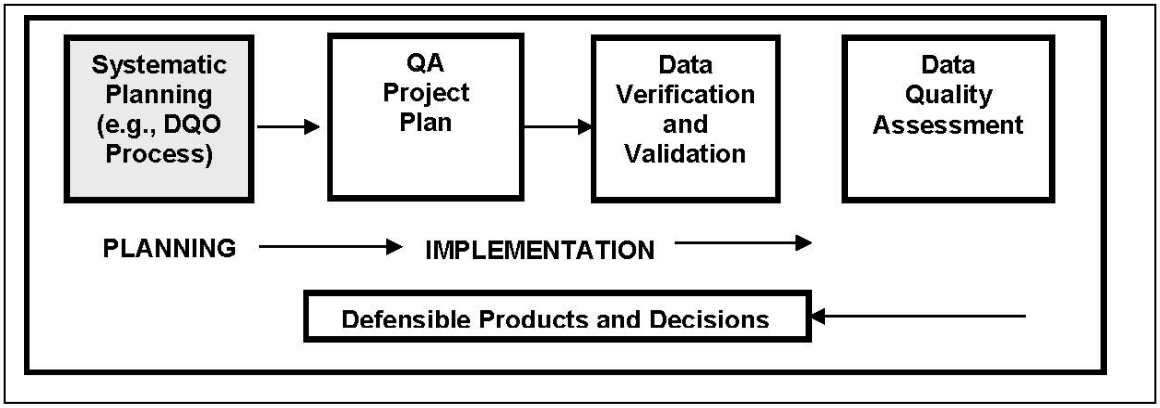
Data Validation Standard Operating Procedure

Foth Infrastructure & Environment, LLC

Standard Operating Procedure



Data Verification, Validation, and Qualification

Introduction

The purpose of this Standard Operating Procedure (SOP) is to establish a procedure for the verification, validation, and qualification of laboratory analytical data. This SOP establishes guidelines for:

1. Reviewing project data quality objectives (DQOs) for environmental projects.
2. Selecting the appropriate stage (e.g., Stage 1, 2A, 2B, 3, 4) of analytical laboratory data verification and validation.
3. Selecting the appropriate level (e.g., Level I, II, III, IV) of analytical laboratory data deliverables for the intended stage of data verification and validation.
4. Performing data qualification.
5. Reporting results and data quality assessment.

This SOP assumes that the DQO process is complete. This SOP can be used during the development of a Quality Assurance Project Plan (QAPP) for specifying data quality procedures, or before, during, and after environmental sampling programs to aid in selection and execution of data quality procedures.

Definitions

Data Review – The process of examining and/or evaluating data to varying levels of detail and specificity. Data review includes verification, validation, and usability assessment.

Verification – Completeness check to confirm that the specified analytical requirements have been met. For this guidance, *data verification* consists of a completeness check to confirm that all data requested from the laboratory have been received and comply with specified requirements.

Validation – Confirmation that the accuracy and quality data requirements are fulfilled for a specific intended use. For this guidance, *data validation* consists of analyte and sample specific process for evaluating compliance of the laboratory data received with methods, procedures, or contract requirements.

Data Verification and Validation

The USEPA Superfund Analytical Services Contract Laboratory Program (USEPA CLP) website includes the most current guidance for analytical laboratory data verification and validation: https://www.epa.gov/clp. Historical guidance for laboratory analytical data verification and validation includes the following documents:

USEPA, 1987. *A Compendium of Superfund Field Operations Methods.* EPA/540/P-87/001. Office of Solid Waste and Emergency Response, Washington, D.C. December.

USEPA, 2002. *Guidance on Environmental Data Verification and Data Validation.* EPA QA/G-8. Office of Environmental Information, Washington, D.C. November. https://www.epa.gov/quality/guidance-environmental-data-verification-and-data-validation.

USEPA, 2009. *Guidance for Labeling Externally Validated Laboratory Analytical Data for Superfund Use.* EPA 540-R-08-005. Office of Solid Waste and Emergency Response, Washington, D.C. January 13.

Data Qualification

The USEPA CLP website includes the most current National Functional Guidelines for analytical laboratory data review and qualification data: https://www.epa.gov/clp/superfund-clp-national-functional-guidelines-data-review, and includes the following documents (as of January 2022):

USEPA, 2020. *National Functional Guidelines for Superfund Organic Methods Data Review*. EPA 540-R-20-005. Office of Superfund Remediation and Technology Innovation, Washington D.C. November.

USEPA, 2020. *National Functional Guidelines for Inorganic Superfund Methods Data Review*. EPA 542-R-20-006. Office of Superfund Remediation and Technology Innovation, Washington D.C. November.

USEPA, 2020. *National Functional Guidelines for High Resolution Superfund Methods Data Review*. EPA 542-R-20-007. Office of Superfund Remediation and Technology Innovation, Washington D.C. November.

Personnel Qualifications

None, according to USEPA guidance documents.

Equipment and Supplies

Materials referenced in this SOP include:

- Project planning documents, such as a QAPP, Sampling and Analysis Plan (SAP), Hydrologic Monitoring System Plan (HMSP) or project Work Plan that state project DQOs, including performance and acceptance/usability criteria. This SOP assumes that DQOs for the project have already been established.
- Laboratory hard copy analytical data deliverables.
- Laboratory electronic analytical data deliverables (EDDs).

Procedures

Review Objectives and Determine Stage of Review

1. Review the Project DQOs to ensure understanding of data type, location, quantity, and quality needed to make defensible decisions. The performance and acceptance criteria are established in the project DQOs.

2. Select data verification and validation stage, as established in the project planning document.

    a. Stage 1 – A verification and validation based only on completeness and compliance of sample receipt condition checks. Checks include a comparison of reported results against DQOs (e.g., sample locations, field quality control (QC) samples, analytical methods, analyte counts, units, reporting limits, etc.), method preservation requirements (e.g., temperature, pH, headspace, etc.), assessment of non-QC laboratory qualifiers (e.g., primary sample holding time, primary sample dilution, etc.), and assessment of transcription or reporting errors.

    b. Stage 2A – A verification and validation based on completeness and compliance checks of sample receipt conditions and **ONLY** sample-related QC results. Checks include a review of instrument performance related results such as field QC samples (e.g., TB, FB, EB, FD, etc.) and analytical method QC samples (e.g., MB, LCS/LCSD, MS/MSD, surrogates, etc.). Stage 2A Modified excludes review of laboratory QC results (e.g., LCS/LCSD, MS/MSD, and laboratory duplicates).

    c. Stage 2B – A verification and validation based on completeness and compliance checks of sample receipt conditions and **BOTH** sample-related and instrument-related QC results. Checks include a review of instrument tuning related results such as the number, concentration, and frequency of calibration standards (e.g., initial calibration standards, ICV, ICB, CCV, CCB, etc.), as well the curves, percent recovery/difference, equations, calculations, weighting factors, and/or correlation coefficients as appropriate.

    d. Stage 3 – A verification and validation based on completeness and compliance checks of sample receipt conditions, **BOTH** sample-related and instrument-related QC results, **AND** recalculation checks (to check for computational errors). Stage 3 Validation requires the use of the laboratory reported instrument response data to recalculate calibration windows, analyte retention time, analyte concentration, and instrument performance QC sample recovery (e.g., percent recovery [%R], relative percent difference [RPD], etc.). The results of these recalculations are compared to the results of the laboratory calculations for accuracy.

e. Stage 4 – A verification and validation based on completeness and compliance checks of sample receipt conditions, both sample-related and instrument-related QC results, recalculation checks, **AND** review of the laboratory raw instrument output to check for parameterization errors. Stage 4 Validation requires the use of the laboratory raw instrument output to determine analyte identification and analyte quantitation from analyte-specific characteristics (e.g., column retention time, fluorescence, etc.) expressed as a signal in the raw instrument output. The results of this determination are compared to the laboratory determination for accuracy.

3. Select the level of laboratory analytical data deliverables. The laboratory can provide data at different levels, with each level including increasing amounts of information and detail.

   a. Level I – Cover sheet, case narrative, analytical results, sample receiving log, and Chain of Custody (COC). This report is suitable for meeting Stage 1 data verification and validation.

   b. Level II – Level I plus quality control summaries, QC qualifier legend sample summary, lab certification reports, sample analyte count, QC cross-reference table, transfer log. This report is suitable for meeting Stages 1 and 2A data verification and validation.

   c. Level III – Level II plus calibration data, tuning, and check data. This report is suitable for meeting Stages 1, 2A, and 2B data verification and validation.

   d. Level IV – Level III plus instrument run logs, raw data. This report is suitable for meeting Stages 1, 2A, 2B, 3, and 4 data verification and validation.

Perform Data Verification, Validation, and Qualification

Perform Stage 2A Modified data verification, validation, and qualification following procedures described in current USEPA CLP National Functional Guidelines and outlined below. Additional guidance regarding analyte, method, and/or instrument specific qualification may be found on the USEPA CLP website.

1. Confirm that all investigative and field QC samples planned were collected and received by the laboratory by looking at the field notes, COC, and project planning documents.

2. Verify that sample names and times were documented correctly on the COC, that sample names align with project planning documents, and confirm relinquish & receipt signatures.

3. Review the laboratory report case narrative for items noted by the laboratory that may impact the validation process.

4. Confirm sample receipt at laboratory in acceptable condition and confirm preservation meets method requirements. Any samples analyzed out of preservation requirements should be reviewed for potential bias.

5. Confirm that analytes and methods match the project planning documents and that the laboratory provided all analytes and methods ordered.

6. Confirm laboratory performed extractions and analyses within method-required holding times. Any samples extracted or analyzed out of holding time should be reviewed for potential bias.

7. Confirm field, method, and trip blanks were collected at the frequency specified in the project planning documents. Confirm no detections in laboratory method blanks, field blanks, and trip blanks. If detections are identified in the blank results, actions to be taken, including applying data qualifiers, will be conducted in accordance with the current USEPA CLP National functional guidelines unless otherwise specified in the project planning documents. A summary of the blank

evaluation criteria and actions based on the USEPA CLP National Functional Guidelines dated November 2020 is provided in Attachment 1.

8. For *organic analyses only*, confirm surrogates (or deuterated monitoring compounds) were analyzed and evaluate surrogate recovery compared to laboratory's surrogate acceptance limits or surrogate acceptance limits specified in the project planning documents. If surrogate recovery is outside the acceptance limits, actions to be taken, including applying data qualifiers, will be conducted in accordance with the current UESPA CLP National Functional Guidelines unless otherwise specified in the project planning documents. A summary of the surrogate evaluation criteria and actions based on the USEPA CLP National Functional Guidelines dated November 2020 is provided in Attachment 1.

9. Confirm field duplicates were collected at the frequency specified in the project planning documents. If the parent and duplicate sample concentrations are greater than or equal to (≥) 5x the PQL, the RPD between parent and duplicate sample concentrations will be calculated using the following equation:

$$RPD = \frac{(A - B)}{A + B/2} \times 100$$

Where:
A = analytical result from one of two duplicate measurements
B = analytical result from the second measurement

Precision measurements can be affected by how close a chemical concentration is to the practical quantitation limit, which can increase the percent error (or RPD). Therefore, in cases where either the parent or the duplicate sample concentration is less than (<) 5x the PQL, the absolute difference between the parent and duplicate sample concentrations will be calculated (i.e., low-level RPD).

Unless otherwise specified in the project planning documents, the acceptance criteria for field duplicate RPDs are as follows:

a. The field duplicate RPD criteria are less than or equal to (≤) 30 percent (%) for water samples and ≤ 50% for soil samples.

b. For low-level RPD comparisons, the absolute difference between the parent and duplicate sample concentrations shall not exceed 5x the PQL.

c. If either of these criteria are not met, both sample results should be qualified J or UJ. Detected results will be assigned a J qualifier, and non-detects will be assigned a UJ qualifier.

Data Qualifiers

The following data qualifiers may be used during data validation and/or retained from the laboratory.

- U = The analyte was analyzed for and was not detected above the numerical quantitation limit (i.e., reporting limit).
- J = The analyte was analyzed for and was positively identified, but the analytical result (i.e., quantitation) is an estimated value. In some cases, it is recognized that the estimated value is biased high (J+), suggesting the actual value is lower than estimated; or biased low (J-), suggesting the actual value is higher than estimated.

- UJ = The analyte was analyzed for and was not detected above the reporting limit, but the reporting limit is an estimated value.
- R = The analyte was analyzed for but may or may not be present and/or quantifiable due to quality control issues. The analytical result is not usable and should be rejected.
- N = The analysis indicates presumptive evidence of the presence of the analyte.
- NJ = The analysis indicates presumptive evidence of the presence of the analyte, but the numerical value is an estimated quantity.

Results qualified J (J, J+, and J-) or UJ are of acceptable data quality and may be used quantitatively per USEPA guidelines.

Reporting

The results of the data quality procedures should be summarized into a deliverable. An example deliverable used to communicate the results of Stage 2A Modified data validation is provided in Attachment 2. The deliverable should include an overall data quality assessment relative to the project DQOs and state if the data set is usable for the intended purposes of the project. The overall data quality assessment may include the following evaluations:

- Method Criteria: Review of the methods and analytes requested, chain of custody and sample receipt forms, sample conditions upon receipt, and holding times to ensure that samples were collected, preserved, shipped/delivered, and analyzed within the method protocols.
- Precision: Defined as the agreement between a set of replicate measurements without assumption or regard about the true value and is a measure of the reproducibility of individual measurements. Field duplicate samples will be used to assess precision.
- Accuracy: An expression of the degree to which a measured value represents the true value. Accuracy will be assessed through a review of surrogate, matrix spike, and laboratory control sample results. Accuracy will be defined as the percent recovery (%R) of an analyte in a reference standard or spiked sample. The acceptance criteria are dependent on the analytical method and established by individual laboratories. Acceptable accuracy will be defined as achieving %R within the recovery limits established by the analytical laboratory for the method utilized.
- Representativeness: The degree that data accurately and precisely represents the environment and conditions that the sample targeted. Representativeness will be achieved by conducting sampling in accordance with the sample collection procedures described in the project planning documents.
- Comparability: Expresses the confidence with which one data set can be evaluated in relation to another data set. Data are considered comparable if collection techniques, measurement procedures, methods, and reporting are equivalent for the samples within a sample set. Note that methods of sample collection and analyses may differ due to geologic and hydrogeologic conditions at individual sample locations and through time, meaning some data sets vary in comparability. To the extent practicable, consistent sampling techniques and analytical methods should be utilized.
- Completeness: Measures the amount of data determined to be valid relative to the amount of data collected. Completeness is also a measure of the amount of valid data generated versus the amount of data planned for collection, ensuring sufficient data are available to make project decisions. A completeness goal for most projects will be 90%.

- Suitability for Intended Use: An overall review of the event data to ensure that results are applicable for their intended use. If gross contamination or significant issues with the method criteria, precision, accuracy, representativeness, comparability, or completeness are identified, the reviewer may indicate that entire event data may not be suitable for use, and resampling or other corrective actions may be required.

Attachment 1

Summary of Data Validation Evaluation Criteria and Actions

(Based on the USEPA CLP National Functional Guidelines dated November 2020)

Foth Infrastructure & Environment, LLC

Summary of Data Validation Evaluation Criteria and Actions

This attachment provides the evaluation criteria and actions recommended for review of blank samples and surrogates based on the USEPA CLP National Functional Guidelines dated November 2020.

Blank Review

Blank Result	Sample Result	Action
VOCs and Non-Halogenated Organic Compounds (Method 8015B)		
>MDL and <PQL	Non-Detect	No qualification
	>MDL and <PQL	Qualify U and report at PQL
	≥PQL but <Blank Multiplier (1)	Qualify U and report at PQL
	≥PQL and ≥Blank Multiplier (1)	Qualify J+ and report at sample result or no qualification
≥PQL	Non-Detect	No qualification
	>MDL and <PQL	Qualify U and report at PQL
	≥PQL but <Blank Multiplier (1)	Qualify U and report at sample result
	≥PQL and ≥Blank Multiplier (1)	Qualify J+ and report at sample result or no qualification
SVOCs, Pesticides, Herbicides, and PCBs		
>MDL and <PQL	Non-Detect	No qualification
	>MDL and <PQL	Qualify U and report at PQL
	≥PQL	Qualify J+ and report at sample result or no qualification
≥PQL	Non-Detect	No qualification
	>MDL and <PQL	Qualify U and report at PQL
	≥PQL but <Blank	Qualify U and report at sample result
	≥PQL and ≥Blank	Qualify J+ and report at sample result or no qualification
Metals (ICP-AES and ICP-MS Methods), Mercury, Cyanide, Anions, and Total Organic Carbon		
>MDL and <PQL	Non-Detect	No qualification
	>MDL and <PQL	Qualify U and report at PQL
	≥PQL	Qualify J+ and report at sample result or no qualification
≤MDL but >QL	Non-Detect	UJ (2)
	Detect	J- or no qualification
≥PQL	Non-Detect	No qualification
	>MDL and <PQL	Qualify U and report at PQL
	≥PQL but <10x Blank	Qualify J+ and report at blank result or R
	≥PQL and ≥10x Blank	No qualification

MDL = minimum detection limit
PCB = polychlorinated biphenyl
PQL = practical quantitation limit
SVOC = semivolatile organic compound
VOC = volatile organic compound

(1) For VOCs, a blank multiplier of 1x will generally be utilized. For common laboratory contaminants (2-butanone, acetone, methylene chloride), a blank multiplier of 2x will be used.

(2) For cyanide, the action is no qualification.

Foth Infrastructure & Environment, LLC

Surrogates or Deuterated Monitoring Compounds

Criteria	Action [1,2]	
	Detect	Non-Detect
VOCs and Non-Halogenated Organic Compounds (Method 8015B)		
%R < Expanded Lower Acceptance Limit (10%)	J-	R
Expanded Lower Acceptance Limit (10%) ≤ %R < specified Lower Acceptance Limit	J-	UJ
%R within specified Acceptance Limits	No qualification	No qualification
%R > specified Upper Acceptance Limit	J+	No qualification
SVOCs		
%R < Expanded Lower Acceptance Limit (10%, excluding surrogates with 10% as the lower acceptance limit, undiluted sample analysis)	J-	R
Expanded Lower Acceptance Limit (10%) ≤ %R (excluding surrogates with 10% as the lower acceptance limit, undiluted sample analysis) < specified Lower Acceptance Limit	J-	UJ
%R < specified Lower Acceptance Limit (diluted sample analysis)	Use professional judgment	Use professional judgment
%R within specified Acceptance Limits	No qualification	No qualification
%R > specified Upper Acceptance Limit	J+	No qualification
Pesticides, Herbicides, and PCBs		
%R < Expanded Lower Acceptance Limit (10%, undiluted sample)	J-	R
%R < Expanded Lower Acceptance Limit (10%, diluted sample)	Use professional judgment	Use professional judgment
Expanded Lower Acceptance Limit (10%) ≤ %R < specified Lower Acceptance Limit	J-	UJ
%R within specified Acceptance Limits	No qualification	No qualification
Upper Acceptance Limit < %R ≤ Expanded Upper Acceptance Limit (200%)	J+	No qualification
%R > Expanded Upper Acceptance Limit (200%)	J+	Use professional judgment

%R = percent recovery
PCB = polychlorinated biphenyl
SVOC = semivolatile organic compound
VOC = volatile organic compound

(1) For VOCs, pesticides, herbicides, and PCBs, qualifiers are assigned to all target analytes in the method for the individual sample the surrogate was analyzed with.

(2) For SVOCs, qualifiers are not assigned to all target analytes in the method for the individual sample the surrogate was analyzed with, but rather a shorter list of target analytes in the method list. The analytical laboratory or project planning document should be consulted for associated target SVOC analytes corresponding to each surrogate.

Attachment 2
Example Deliverable for Stage 2A Modified Data Validation

Foth Infrastructure & Environment, LLC

Data Validation Report

Project Name:	
Task Name:	
Data Set Description:	
Laboratory(s):	
Laboratory Sample Delivery Group (SDG) ID(s):	
Sample Collection Dates:	
Sample Analysis Dates:	
Sample Matrices:	
Sample IDs Reviewed:	See Table 1
Verification and Validation Stage, 100% data:	☐ 1 ☒ 2A Modified ☐ 2A ☐ 2B ☐ 3 ☐ 4
Verified and Validated By:	

The analytical data were validated to verify that laboratory quality assurance and quality control (QA/QC) procedures were documented and to evaluate the overall quality of the data reported. Analytical reports include [insert number and type of samples collected and collection method] at [insert site] from [insert sample collection dates]; samples are listed in Table 1. The data were collected in accordance with [insert references to the project planning documents and/or regulatory codes].

Validation Summary

Stage 2A Modified data validation was performed on 100% of the data from these sample delivery groups (SDGs), with review tasks and items of note documented in the summary table below.

Validation Task and Description	Review Notes	Action
Chain of Custody (COC) and Sample Receipt Form Confirm relinquish & receipt signatures. Confirm parameters and analytical methods match COC and project planning documents.		
Case Narrative Review for items noted by the laboratory that may impact the validation process.		

Foth Infrastructure & Environment, LLC

Validation Task and Description	Review Notes	Action
Sample Condition Upon Receipt (SCUR) Confirm samples in acceptable condition and no discrepancies noted. Confirm preservation meets method requirements.		
Methods Requested Confirm methods match project requirements and lab provided all methods ordered.		
Analytes Requested Confirm analytes ordered match project requirements and lab provided all analytes ordered.		
Holding Times Confirm laboratory performed extractions and analyses within method-required holding times.		
Blanks Confirm no detections in laboratory method blanks, field blanks, and trip blanks.		
Surrogates or Deuterated Monitoring Compounds For *organic analyses only*, confirm surrogates analyzed and surrogate recovery within QC limits.		
Field Duplicates Confirm field duplicates collected at required frequency and field duplicate RPD within acceptable limits.		

Abbreviations:
COC = Chain of Custody
EDD = electronic data deliverable
LCS = laboratory control sample
LCSD = laboratory control sample duplicate
MS = matrix spike
MSD = matrix spike duplicate
RPD = relative percent difference
SCUR = Sample Condition Upon Receipt

Overall Assessment of Data

Item	Acceptable		Comments
	Yes	No	
1. Method Criteria			
2. Precision			
3. Accuracy			
4. Representativeness			
5. Comparability			
6. Completeness			
7. Suitability for Intended Use			

Overall, the data reported are of good quality and the results for the applicable quality assurance/quality control (QA/QC) measurements that were used by the laboratories during the analysis of the samples were generally acceptable. Some sample results required qualification during data validation because method-specific QA/QC criteria were not met; results may be qualified for more than one reason. These qualified data are usable, represent data of good quality and reasonable confidence, and have an acceptable degree of uncertainty (i.e., may be less precise or less accurate than unqualified data). Table 2 provides a definition of the qualifiers that may be assigned by the validator and/or retained from the laboratory. A summary of the validation qualifiers is provided below.

- No results were qualified as [insert qualifiers not utilized].
- Insert discussion on number of results that were assigned qualifiers. For example: Two results (0.1%) were qualified as estimated (assigned as J qualifiers).
- [Insert percent] of the data is usable for project data quality objectives.

Confidence Limits (Assessment)

Graph 1

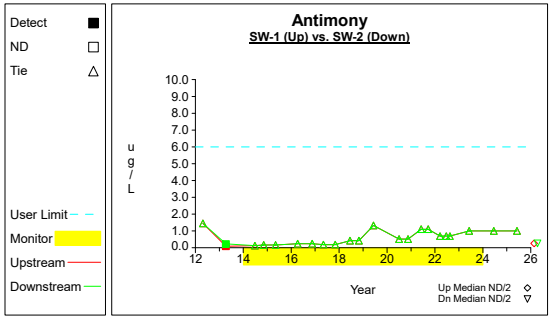
Graph 2

Table 1

Confidence Intervals for Comparing the Mean of the Last 8 Measurements to an Assessment Monitoring Standard

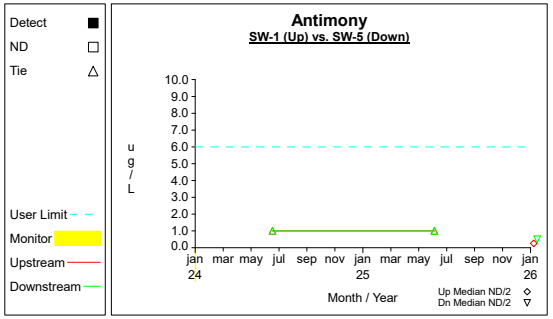
Constituent	Units	Well	N	Mean	SD	Factor	95% LCL	95% UCL	Standard	Trend
Cobalt	ug/L	SW-2	8	0.589	1.079	0.670	0.000	1.312	3.400	
Cobalt	ug/L	SW-5	6	0.326	0.382	0.822	0.012	0.641	3.400	

* - Insufficient Data
** - Significant Exceedance
LCL = Lower Confidence Limit
UCL = Upper Confidence Limit



Worksheet 6 - Assessment Monitoring
Cobalt (ug/L) at SW-2

Step	Equation	Description
1	$\overline{X}$ = **sum[X]** / **N** = **4.713** / **8** = **0.589**	Compute the mean of the last 8 measurements.
2	S = ((**sum[X^2]** - **sum[X]**^{2}/**N**) / (**N**-1))$^{1/2}$ = ((**10.926** - **22.208**/**8**) / (**8**-1))$^{1/2}$ = **1.079**	Compute sd of the last 8 measurements.
3	LCL = $\overline{\mathbf{X}}$ - **tS**/**N**$^{1/2}$ = **0.589** - **1.895** * **1.079**/**8**$^{1/2}$ = **0.0**	Compute lower confidence limit for the mean of the last 8 measurements.
4	UCL = $\overline{\mathbf{X}}$ + **tS**/**N**$^{1/2}$ = **0.589** + **1.895** * **1.079**/**8**$^{1/2}$ = **1.312**	Compute upper confidence limit for the mean of the last 8 measurements.
5	N' = **N** * (**N**-1) / 2 = **23** * (**23**-1) / 2 = **253**	Number of sample pairs during trend detection period.
6	S = **0.0**	Sen's estimator of trend.
7	var(S) = **1100.0**	Variance estimate for slope.
8	M(S) = (**N'** ± **Z**$_{.995}$ * **var(S)**$^{1/2}$) / 2 = (**253** ± **2.576** * **1100.0**$^{1/2}$) / 2 = [**83.782**, **169.218**]	Ordinal positions for two-sided lower confidence limits for slope. The LCL and UCL are the Mth largest slope estimates for the values shown. When the values are not integers, interpolation is used.
9	CL(S) = [**-0.05**, **0.0**]	Two-sided confidence interval for slope.
10	the interval includes 0	There is no significant trend.



Worksheet 6 - Assessment Monitoring
Cobalt (ug/L) at SW-5

Step	Equation	Description
1	$\overline{X}$ = **sum[X]** / **N** = **1.957** / **6** = **0.326**	Compute the mean of the last 6 measurements.
2	S = ((**sum[X^2]** - **sum[X]**^{2}/**N**) / (**N**-1))^{½} = ((**1.37** - **3.83**/**6**) / (**6**-1))^{½} = **0.382**	Compute sd of the last 6 measurements.
3	LCL = $\overline{\mathbf{X}}$ - **tS**/**N**^{½} = **0.326** - **2.014** * **0.382**/**6**^{½} = **0.012**	Compute lower confidence limit for the mean of the last 6 measurements.
4	UCL = $\overline{\mathbf{X}}$ + **tS**/**N**^{½} = **0.326** + **2.014** * **0.382**/**6**^{½} = **0.641**	Compute upper confidence limit for the mean of the last 6 measurements.
5	N' = **N** * (**N**-1) / 2 = **6** * (**6**-1) / 2 = **15**	Number of sample pairs during trend detection period.
6	S = **0.269**	Sen's estimator of trend.
7	var(S) = **19.667**	Variance estimate for slope.
8	M(S) = (**N'** ± **Z**$_{.995}$ * **var(S)**^{½}) / 2 = (**15** ± **2.576** * **19.667**^{½}) / 2 = [**1.788**, **13.212**]	Ordinal positions for two-sided lower confidence limits for slope. The LCL and UCL are the Mth largest slope estimates for the values shown. When the values are not integers, interpolation is used.
9	CL(S) = [**-0.25**, **1.116**]	Two-sided confidence interval for slope.
10	the interval includes 0	There is no significant trend.

Vanadium	7	19	0.368	11	37	0.297
Zinc	1	19	0.053	8	37	0.216

N = Total number of measurements in all wells.
Detect = Total number of detections in all wells.
Proportion = Detect/N.

Table 4

Shapiro-Wilk Multiple Group Test of Normality

Constituent	Detect	N	Detect Freq	G raw	G log	G cbrt	G sqrt	G sqr	G cub	Crit Value	Dist Form
Antimony	0	19	0.000	5.018	5.018					2.326	non-norm
Arsenic	1	19	0.053	24.856	24.856					2.326	non-norm
Barium	19	19	1.000	4.264	3.330					2.326	non-norm

Zinc	1	19	0.053	24.856	24.856					2.326	non-norm

* - Distribution override for that constituent.
Fit to distribution is confirmed if G <= critical value.
Model type may not match distributional form when detection frequency < 50%.

Table 4

Vanadium	ug/L	7	19					7.5900	nonpar		0.99
Zinc	ug/L	1	19					20.7000	nonpar		0.99

Conf = confidence level for passing initial test or one of two verification resamples at all downgradient wells for a single constituent (nonparametric test only).
* - Insufficient Data.
** - Calculated limit raised to Manual Reporting Limit.
*** - Nonparametric limit based on ND value.
For transformed data, mean and SD in transformed units and prediction limit in original units.
All sample sizes and statistics are based on outlier free data.
For nonparametric limits, median reporting limits are substituted for extreme reporting limit values.

Table 6

Dixon's Test Outliers
1% Significance Level

Constituent	Units	Well	Date	Result	ND Qualifier	Date Range	N	Critical Value

N = Total number of independent measurements in background at each well.
Date Range = Dates of the first and last measurements included in background at each well.
Critical Value depends on the significance level and on N-1 when the two most extreme values are tested or N for the most extreme value.

Table 7

Censored Data Outliers Test
for datasets with 75% or more NDs

Constituent	Units	Well	Date	Result	Detects	N	% >= PQL	% >= MDL	Manual RL	Median	>= Med

* Failed test - potential outlier.
Potential outliers are not removed from statistical analyses.
>= Med - indicates if the result is greater than or equal to the median PQL value.
>= 2x - indicates if the result is greater than or equal to 2 x the median PQL value.
>= 3x - indicates if the result is greater than or equal to 3 x the median PQL value.

Worksheet 1 - Upgradient vs. Downgradient Comparisons
Antimony (ug/L)
Nonparametric Prediction Limit

Step	Equation	Description
1	PL = median(X) = **0.51**	Compute nonparametric prediction limit as median reporting limit in background.
2	Conf = **0.99**	Confidence level is based on N, K and resampling strategy (see Gibbons 1994).

Worksheet 1 - Upgradient vs. Downgradient Comparisons
Arsenic (ug/L)
Nonparametric Prediction Limit

Step	Equation	Description
1	PL = max(X) = **2.54**	Compute nonparametric prediction limit as largest background measurement.
2	Conf = **0.99**	Confidence level is based on N, K and resampling strategy (see Gibbons 1994).

Worksheet 1 - Upgradient vs. Downgradient Comparisons
Barium (ug/L)
Nonparametric Prediction Limit

Step	Equation	Description
1	PL = max(X) = **201.0**	Compute nonparametric prediction limit as largest background measurement.
2	Conf = **0.99**	Confidence level is based on N, K and resampling strategy (see Gibbons 1994).

Worksheet 1 - Upgradient vs. Downgradient Comparisons
Beryllium (ug/L)
Nonparametric Prediction Limit

Step	Equation	Description
1	PL = median(X) = **0.27**	Compute nonparametric prediction limit as median reporting limit in background.
2	Conf = **0.99**	Confidence level is based on N, K and resampling strategy (see Gibbons 1994).

Worksheet 1 - Upgradient vs. Downgradient Comparisons
Cadmium (ug/L)
Nonparametric Prediction Limit

Step	Equation	Description
1	PL = max(X) = **0.228**	Compute nonparametric prediction limit as largest background measurement.
2	Conf = **0.99**	Confidence level is based on N, K and resampling strategy (see Gibbons 1994).

Worksheet 1 - Upgradient vs. Downgradient Comparisons
Chromium (ug/L)
Nonparametric Prediction Limit

Step	Equation	Description
1	PL = median(X) = **1.1**	Compute nonparametric prediction limit as median reporting limit in background.
2	Conf = **0.99**	Confidence level is based on N, K and resampling strategy (see Gibbons 1994).

Worksheet 1 - Upgradient vs. Downgradient Comparisons
Cobalt (ug/L)
Nonparametric Prediction Limit

Step	Equation	Description
1	PL = max(X) = **4.36**	Compute nonparametric prediction limit as largest background measurement.
2	Conf = **0.99**	Confidence level is based on N, K and resampling strategy (see Gibbons 1994).

Worksheet 1 - Upgradient vs. Downgradient Comparisons
Copper (ug/L)
Nonparametric Prediction Limit

Step	Equation	Description
1	PL = max(X) = **11.5**	Compute nonparametric prediction limit as largest background measurement.
2	Conf = **0.99**	Confidence level is based on N, K and resampling strategy (see Gibbons 1994).

Worksheet 1 - Upgradient vs. Downgradient Comparisons
Lead (ug/L)
Nonparametric Prediction Limit

Step	Equation	Description
1	PL = max(X) = **7.08**	Compute nonparametric prediction limit as largest background measurement.
2	Conf = **0.99**	Confidence level is based on N, K and resampling strategy (see Gibbons 1994).

Worksheet 1 - Upgradient vs. Downgradient Comparisons
Nickel (ug/L)
Nonparametric Prediction Limit

Step	Equation	Description
1	PL = max(X) = **7.85**	Compute nonparametric prediction limit as largest background measurement.
2	Conf = **0.99**	Confidence level is based on N, K and resampling strategy (see Gibbons 1994).

Worksheet 1 - Upgradient vs. Downgradient Comparisons
Selenium (ug/L)
Nonparametric Prediction Limit

Step	Equation	Description
1	PL = max(X) = **0.96**	Compute nonparametric prediction limit as largest background measurement.
2	Conf = **0.99**	Confidence level is based on N, K and resampling strategy (see Gibbons 1994).

Worksheet 1 - Upgradient vs. Downgradient Comparisons
Silver (ug/L)
Nonparametric Prediction Limit

Step	Equation	Description
1	PL = max(X) = **1.36**	Compute nonparametric prediction limit as largest background measurement.
2	Conf = **0.99**	Confidence level is based on N, K and resampling strategy (see Gibbons 1994).

Worksheet 1 - Upgradient vs. Downgradient Comparisons
Thallium (ug/L)
Nonparametric Prediction Limit

Step	Equation	Description
1	PL = max(X) = **4.67**	Compute nonparametric prediction limit as largest background measurement.
2	Conf = **0.99**	Confidence level is based on N, K and resampling strategy (see Gibbons 1994).

Worksheet 1 - Upgradient vs. Downgradient Comparisons
Vanadium (ug/L)
Nonparametric Prediction Limit

Step	Equation	Description
1	PL = max(X) = **7.59**	Compute nonparametric prediction limit as largest background measurement.
2	Conf = **0.99**	Confidence level is based on N, K and resampling strategy (see Gibbons 1994).

Worksheet 1 - Upgradient vs. Downgradient Comparisons
Zinc (ug/L)
Nonparametric Prediction Limit

Step	Equation	Description
1	PL = max(X) = **20.7**	Compute nonparametric prediction limit as largest background measurement.
2	Conf = **0.99**	Confidence level is based on N, K and resampling strategy (see Gibbons 1994).

Table 1

Confidence Intervals and Sign Test for Comparing Upstream and Downstream Concentrations

Constituent	Units	Upstream	Downstream	# of Pairs	# of Ties	# DN > UP	Critical #		UP UCL	DN UCL

Worksheet 7 - Surface Water Monitoring
Antimony (ug/L) for SW-1 (Up) vs. SW-2 (Down)

Step	Equation	Description
1	UCL(Upstream) = $\overline{\mathbf{X}}$ + **tS** / **N**$^{1/2}$ = **0.255** + **1.734** * **7.08**x**10**$^{-9}$ / **19**$^{1/2}$ = **0.255**	Upper confidence limit for all Upstream data.
2	UCL(Downstream) = $\overline{\mathbf{X}}$ + **tS** / **N**$^{1/2}$ = **0.255** + **1.729** * **7.50**x**10**$^{-9}$ / **20**$^{1/2}$ = **0.255**	Upper confidence limit for all Downstream data.
3	Number of paired observations = **18**	
4	Number of ties = **18**	
5	Number of Downstream > Upstream = **0**	
6	Critical number for Downstream > Upstream = **5**	

Worksheet 7 - Surface Water Monitoring
Arsenic (ug/L) for SW-1 (Up) vs. SW-2 (Down)

Step	Equation	Description
1	UCL(Upstream) = $\overline{\mathbf{X}}$ + **tS** / $\mathbf{N}^{1/2}$ = **0.452** + **1.734** * **0.506** / $\mathbf{19}^{1/2}$ = **0.653**	Upper confidence limit for all Upstream data.
2	UCL(Downstream) = $\overline{\mathbf{X}}$ + **tS** / $\mathbf{N}^{1/2}$ = **0.524** + **1.729** * **0.586** / $\mathbf{20}^{1/2}$ = **0.751**	Upper confidence limit for all Downstream data.
3	Number of paired observations = **18**	
4	Number of ties = **0**	
5	Number of Downstream > Upstream = **17**	
6	Critical number for Downstream > Upstream = **13**	

Worksheet 7 - Surface Water Monitoring
Barium (ug/L) for SW-1 (Up) vs. SW-2 (Down)

Step	Equation	Description
1	UCL(Upstream) = $\bar{X}$ + **tS** / **N**$^{1/2}$ = **128.526** + **1.734** * **19.99** / **19**$^{1/2}$ = **136.478**	Upper confidence limit for all Upstream data.
2	UCL(Downstream) = $\bar{X}$ + **tS** / **N**$^{1/2}$ = **107.63** + **1.729** * **27.325** / **20**$^{1/2}$ = **118.194**	Upper confidence limit for all Downstream data.
3	Number of paired observations = **18**	
4	Number of ties = **0**	
5	Number of Downstream > Upstream = **2**	
6	Critical number for Downstream > Upstream = **13**	

Worksheet 7 - Surface Water Monitoring
Beryllium (ug/L) for SW-1 (Up) vs. SW-2 (Down)

Step	Equation	Description
1	UCL(Upstream) = $\overline{\mathbf{X}}$ + **tS** / **N**$^{1/2}$ = **0.135** + **1.734** * **2.09**×**10**$^{-9}$ / **19**$^{1/2}$ = **0.135**	Upper confidence limit for all Upstream data.
2	UCL(Downstream) = $\overline{\mathbf{X}}$ + **tS** / **N**$^{1/2}$ = **0.136** + **1.729** * **0.003** / **20**$^{1/2}$ = **0.137**	Upper confidence limit for all Downstream data.
3	Number of paired observations = **18**	
4	Number of ties = **17**	
5	Number of Downstream > Upstream = **1**	
6	Critical number for Downstream > Upstream = **5**	

Worksheet 7 - Surface Water Monitoring
Cadmium (ug/L) for SW-1 (Up) vs. SW-2 (Down)

Step	Equation	Description
1	UCL(Upstream) = $\overline{\mathbf{X}}$ + **tS** / **N**$^{1/2}$ = **0.051** + **1.729** * **0.062** / **20**$^{1/2}$ = **0.075**	Upper confidence limit for all Upstream data.
2	UCL(Downstream) = $\overline{\mathbf{X}}$ + **tS** / **N**$^{1/2}$ = **0.035** + **1.729** * **0.034** / **20**$^{1/2}$ = **0.048**	Upper confidence limit for all Downstream data.
3	Number of paired observations = **18**	
4	Number of ties = **15**	
5	Number of Downstream > Upstream = **0**	
6	Critical number for Downstream > Upstream = **5**	

Worksheet 7 - Surface Water Monitoring
Chromium (ug/L) for SW-1 (Up) vs. SW-2 (Down)

Step	Equation	Description
1	UCL(Upstream) = $\overline{X}$ + **tS** / **N**$^{1/2}$ = **0.55** + **1.734** * **7.82x10**$^{-9}$ / **19**$^{1/2}$ = **0.55**	Upper confidence limit for all Upstream data.
2	UCL(Downstream) = $\overline{X}$ + **tS** / **N**$^{1/2}$ = **0.703** + **1.729** * **0.513** / **20**$^{1/2}$ = **0.902**	Upper confidence limit for all Downstream data.
3	Number of paired observations = **18**	
4	Number of ties = **15**	
5	Number of Downstream > Upstream = **2**	
6	Critical number for Downstream > Upstream = **5**	

Worksheet 7 - Surface Water Monitoring
Cobalt (ug/L) for SW-1 (Up) vs. SW-2 (Down)

Step	Equation	Description
1	UCL(Upstream) = $\overline{\mathbf{X}}$ + **tS** / $\mathbf{N}^{1/2}$ = **0.37** + **1.734** * **0.985** / $\mathbf{19}^{1/2}$ = **0.762**	Upper confidence limit for all Upstream data.
2	UCL(Downstream) = $\overline{\mathbf{X}}$ + **tS** / $\mathbf{N}^{1/2}$ = **0.389** + **1.729** * **0.715** / $\mathbf{20}^{1/2}$ = **0.666**	Upper confidence limit for all Downstream data.
3	Number of paired observations = **18**	
4	Number of ties = **8**	
5	Number of Downstream > Upstream = **7**	
6	Critical number for Downstream > Upstream = **9**	

Worksheet 7 - Surface Water Monitoring
Copper (ug/L) for SW-1 (Up) vs. SW-2 (Down)

Step	Equation	Description
1	UCL(Upstream) = $\bar{X}$ + **tS** / **N**$^{1/2}$ = **1.389** + **1.734** * **2.455** / **19**$^{1/2}$ = **2.366**	Upper confidence limit for all Upstream data.
2	UCL(Downstream) = $\bar{X}$ + **tS** / **N**$^{1/2}$ = **1.195** + **1.725** * **1.339** / **21**$^{1/2}$ = **1.699**	Upper confidence limit for all Downstream data.
3	Number of paired observations = **18**	
4	Number of ties = **13**	
5	Number of Downstream > Upstream = **3**	
6	Critical number for Downstream > Upstream = **5**	

Worksheet 7 - Surface Water Monitoring
Lead (ug/L) for SW-1 (Up) vs. SW-2 (Down)

Step	Equation	Description
1	UCL(Upstream) = $\bar{X}$ + **tS** / **N**$^{1/2}$ = **0.619** + **1.734** * **1.582** / **19**$^{1/2}$ = **1.248**	Upper confidence limit for all Upstream data.
2	UCL(Downstream) = $\bar{X}$ + **tS** / **N**$^{1/2}$ = **0.59** + **1.729** * **1.157** / **20**$^{1/2}$ = **1.037**	Upper confidence limit for all Downstream data.
3	Number of paired observations = **18**	
4	Number of ties = **7**	
5	Number of Downstream > Upstream = **6**	
6	Critical number for Downstream > Upstream = **9**	

Worksheet 7 - Surface Water Monitoring
Nickel (ug/L) for SW-1 (Up) vs. SW-2 (Down)

Step	Equation	Description
1	UCL(Upstream) = $\overline{\mathbf{X}}$ + **tS** / **N**$^{1/2}$ = **1.209** + **1.734** * **1.638** / **19**$^{1/2}$ = **1.861**	Upper confidence limit for all Upstream data.
2	UCL(Downstream) = $\overline{\mathbf{X}}$ + **tS** / **N**$^{1/2}$ = **1.324** + **1.729** * **1.289** / **20**$^{1/2}$ = **1.822**	Upper confidence limit for all Downstream data.
3	Number of paired observations = **18**	
4	Number of ties = **0**	
5	Number of Downstream > Upstream = **16**	
6	Critical number for Downstream > Upstream = **13**	

Worksheet 7 - Surface Water Monitoring
Selenium (ug/L) for SW-1 (Up) vs. SW-2 (Down)

Step	Equation	Description
1	UCL(Upstream) = $\overline{X}$ + **tS** / **N**$^{1/2}$ = **0.503** + **1.734** * **0.1** / **19**$^{1/2}$ = **0.543**	Upper confidence limit for all Upstream data.
2	UCL(Downstream) = $\overline{X}$ + **tS** / **N**$^{1/2}$ = **0.495** + **1.729** * **0.065** / **20**$^{1/2}$ = **0.52**	Upper confidence limit for all Downstream data.
3	Number of paired observations = **18**	
4	Number of ties = **17**	
5	Number of Downstream > Upstream = **0**	
6	Critical number for Downstream > Upstream = **5**	

Worksheet 7 - Surface Water Monitoring
Silver (ug/L) for SW-1 (Up) vs. SW-2 (Down)

Step	Equation	Description
1	UCL(Upstream) = $\bar{X}$ + **tS** / **N**$^{1/2}$ = **0.206** + **1.729** * **0.272** / **20**$^{1/2}$ = **0.311**	Upper confidence limit for all Upstream data.
2	UCL(Downstream) = $\bar{X}$ + **tS** / **N**$^{1/2}$ = **0.238** + **1.725** * **0.274** / **21**$^{1/2}$ = **0.342**	Upper confidence limit for all Downstream data.
3	Number of paired observations = **19**	
4	Number of ties = **0**	
5	Number of Downstream > Upstream = **18**	
6	Critical number for Downstream > Upstream = **14**	

Worksheet 7 - Surface Water Monitoring
Thallium (ug/L) for SW-1 (Up) vs. SW-2 (Down)

Step	Equation	Description
1	UCL(Upstream) = $\overline{X}$ + **tS** / **N**^{½} = **0.417** + **1.729** * **1.1** / **20**^{½} = **0.842**	Upper confidence limit for all Upstream data.
2	UCL(Downstream) = $\overline{X}$ + **tS** / **N**^{½} = **0.307** + **1.725** * **0.83** / **21**^{½} = **0.619**	Upper confidence limit for all Downstream data.
3	Number of paired observations = **19**	
4	Number of ties = **0**	
5	Number of Downstream > Upstream = **16**	
6	Critical number for Downstream > Upstream = **14**	

Worksheet 7 - Surface Water Monitoring
Vanadium (ug/L) for SW-1 (Up) vs. SW-2 (Down)

Step	Equation	Description
1	UCL(Upstream) = $\overline{\mathbf{X}}$ + **tS** / **N**^{½} = **0.99** + **1.734** * **1.669** / **19**^{½} = **1.654**	Upper confidence limit for all Upstream data.
2	UCL(Downstream) = $\overline{\mathbf{X}}$ + **tS** / **N**^{½} = **1.134** + **1.729** * **1.28** / **20**^{½} = **1.629**	Upper confidence limit for all Downstream data.
3	Number of paired observations = **18**	
4	Number of ties = **0**	
5	Number of Downstream > Upstream = **17**	
6	Critical number for Downstream > Upstream = **13**	

Worksheet 7 - Surface Water Monitoring
Zinc (ug/L) for SW-1 (Up) vs. SW-2 (Down)

Step	Equation	Description
1	UCL(Upstream) = $\overline{\mathbf{X}}$ + **tS** / **N**$^{1/2}$ = **5.826** + **1.734** * **3.602** / **19**$^{1/2}$ = **7.259**	Upper confidence limit for all Upstream data.
2	UCL(Downstream) = $\overline{\mathbf{X}}$ + **tS** / **N**$^{1/2}$ = **6.544** + **1.729** * **6.454** / **20**$^{1/2}$ = **9.039**	Upper confidence limit for all Downstream data.
3	Number of paired observations = **18**	
4	Number of ties = **15**	
5	Number of Downstream > Upstream = **2**	
6	Critical number for Downstream > Upstream = **5**

Conf = confidence level for passing initial test or one of two verification resamples at all downgradient wells for a single constituent (nonparametric test only).
* - Insufficient Data.
** - Calculated limit raised to Manual Reporting Limit.
*** - Nonparametric limit based on ND value.
For transformed data, mean and SD in transformed units and prediction limit in original units.
All sample sizes and statistics are based on outlier free data.
For nonparametric limits, median reporting limits are substituted for extreme reporting limit values.

Table 6

Dixon's Test Outliers
1% Significance Level

Constituent	Units	Well	Date	Result	ND Qualifier	Date Range	N	Critical Value

N = Total number of independent measurements in background at each well.
Date Range = Dates of the first and last measurements included in background at each well.
Critical Value depends on the significance level and on N-1 when the two most extreme values are tested or N for the most extreme value.

ND = Not Detected, Result = detection limit.

Worksheet 1 - Upgradient vs. Downgradient Comparisons
Antimony (ug/L)
Nonparametric Prediction Limit

Step	Equation	Description
1	PL = median(X) = **0.69**	Compute nonparametric prediction limit as median reporting limit in background.
2	Conf = **0.99**	Confidence level is based on N, K and resampling strategy (see Gibbons 1994).

Worksheet 1 - Upgradient vs. Downgradient Comparisons
Arsenic (ug/L)
Nonparametric Prediction Limit

Step	Equation	Description
1	PL = max(X) = **4.57**	Compute nonparametric prediction limit as largest background measurement.
2	Conf = **0.99**	Confidence level is based on N, K and resampling strategy (see Gibbons 1994).

Worksheet 1 - Upgradient vs. Downgradient Comparisons
Barium (ug/L)
Lognormal Prediction Limit

Step	Equation	Description
1	$Y = \log_e(X)$	Transform to natural logarithmic scale.
2	$\overline{Y}$ = **sum[Y]** / **N** = **201.961** / **42** = **4.809**	Compute mean on a natural log scale.
3	$S_Y = ((\mathbf{sum[Y^2]} - \mathbf{sum[Y]}^2/\mathbf{N}) / (\mathbf{N}-1))^{½}$ $= ((\mathbf{976.334} - \mathbf{40788.208}/\mathbf{42}) / (\mathbf{42}-1))^{½}$ = **0.356**	Compute sd on a natural log scale.
4	alpha = min[$(1-.95^{1/\mathbf{K}})^{1/3}$, .01] = min[$(1-.95^{1/\mathbf{432}})^{1/3}$, .01] = **0.01**	Adjusted per comparison false positive rate. Pass initial or 1 of 2 resamples.
5	$PL = \exp[\overline{\mathbf{Y}} + \mathbf{tS_Y}(1+1/\mathbf{N})^{½}]$ $= \exp[\mathbf{4.809}$ $+ (\mathbf{2.421}*\mathbf{0.356})(1+1/\mathbf{42})^{½}]$ = **292.857**	One-sided lognormal prediction limit (t is Student's t on N-1 degrees of freedom and 1-alpha confidence level).

Worksheet 1 - Upgradient vs. Downgradient Comparisons
Beryllium (ug/L)
Nonparametric Prediction Limit

Step	Equation	Description
1	PL = median(X) = **0.27**	Compute nonparametric prediction limit as median reporting limit in background.
2	Conf = **0.99**	Confidence level is based on N, K and resampling strategy (see Gibbons 1994).

Worksheet 1 - Upgradient vs. Downgradient Comparisons
Cadmium (ug/L)
Nonparametric Prediction Limit

Step	Equation	Description
1	PL = max(X) = **0.209**	Compute nonparametric prediction limit as largest background measurement.
2	Conf = **0.99**	Confidence level is based on N, K and resampling strategy (see Gibbons 1994).

Worksheet 1 - Upgradient vs. Downgradient Comparisons
Chromium (ug/L)
Nonparametric Prediction Limit

Step	Equation	Description
1	PL = max(X) = **2.63**	Compute nonparametric prediction limit as largest background measurement.
2	Conf = **0.99**	Confidence level is based on N, K and resampling strategy (see Gibbons 1994).

Worksheet 1 - Upgradient vs. Downgradient Comparisons
Cobalt (ug/L)
Nonparametric Prediction Limit

Step	Equation	Description
1	PL = max(X) = **3.4**	Compute nonparametric prediction limit as largest background measurement.
2	Conf = **0.99**	Confidence level is based on N, K and resampling strategy (see Gibbons 1994).

Worksheet 1 - Upgradient vs. Downgradient Comparisons
Copper (ug/L)
Nonparametric Prediction Limit

Step	Equation	Description
1	PL = max(X) = **7.64**	Compute nonparametric prediction limit as largest background measurement.
2	Conf = **0.99**	Confidence level is based on N, K and resampling strategy (see Gibbons 1994).

Worksheet 1 - Upgradient vs. Downgradient Comparisons
Field pH (SU)
Normal Prediction Limit

Step	Equation	Description
1	$\overline{X}$ = **sum[X]** / **N** = **280.67** / **39** = **7.197**	Compute upgradient mean.
2	S = ((**sum[X^2]** - **sum[X]**^{2}/**N**) / (**N**-1))^{½} = ((**2028.483** - **78775.649**/**39**) / (**39**-1))^{½} = **0.476**	Compute upgradient sd.
3	alpha = min[(1-.95$^{1/\mathbf{K}}$)$^{1/3}$, .01] = min[(1-.95$^{1/\mathbf{432}}$)$^{1/3}$, .01] = **0.01**	Adjusted per comparison false positive rate. Pass initial or 1 of 2 resamples.
4	PL = $\overline{\mathbf{X}}$ + **tS**(1+1/**N**)^{½} = **7.197** + (**2.428*****0.476**)(1+1/**39**)^{½} = **8.366**	One-sided normal prediction limit (t is Student's t on N-1 degrees of freedom and 1-alpha confidence level).

Worksheet 1 - Upgradient vs. Downgradient Comparisons
Field Specific Conductance (umhos/cm)
Lognormal Prediction Limit

Step	Equation	Description
1	$Y = \log_e(X)$	Transform to natural logarithmic scale.
2	$\overline{Y}$ = **sum[Y]** / **N** = **250.727** / **39** = **6.429**	Compute mean on a natural log scale.
3	$S_Y = ((\mathbf{sum[Y^2]} - \mathbf{sum[Y]}^2/\mathbf{N}) / (\mathbf{N}-1))^{½}$ $= ((\mathbf{1615.677} - \mathbf{62863.858}/\mathbf{39}) / (\mathbf{39}-1))^{½}$ = **0.316**	Compute sd on a natural log scale.
4	alpha = min[$(1-.95^{1/\mathbf{K}})^{1/3}$, .01] = min[$(1-.95^{1/\mathbf{432}})^{1/3}$, .01] = **0.01**	Adjusted per comparison false positive rate. Pass initial or 1 of 2 resamples.
5	$PL = \exp[\overline{\mathbf{Y}} + \mathbf{tS_Y}(1+1/\mathbf{N})^{½}]$ $= \exp[\mathbf{6.429}$ $+ (\mathbf{2.428}*\mathbf{0.316})(1+1/\mathbf{39})^{½}]$ = **1345.996**	One-sided lognormal prediction limit (t is Student's t on N-1 degrees of freedom and 1-alpha confidence level).

Worksheet 1 - Upgradient vs. Downgradient Comparisons
Lead (ug/L)
Nonparametric Prediction Limit

Step	Equation	Description
1	PL = max(X) = **3.25**	Compute nonparametric prediction limit as largest background measurement.
2	Conf = **0.99**	Confidence level is based on N, K and resampling strategy (see Gibbons 1994).

Worksheet 1 - Upgradient vs. Downgradient Comparisons
Nickel (ug/L)
Nonparametric Prediction Limit

Step	Equation	Description
1	PL = max(X) = **20.9**	Compute nonparametric prediction limit as largest background measurement.
2	Conf = **0.99**	Confidence level is based on N, K and resampling strategy (see Gibbons 1994).

Worksheet 1 - Upgradient vs. Downgradient Comparisons
Selenium (ug/L)
Nonparametric Prediction Limit

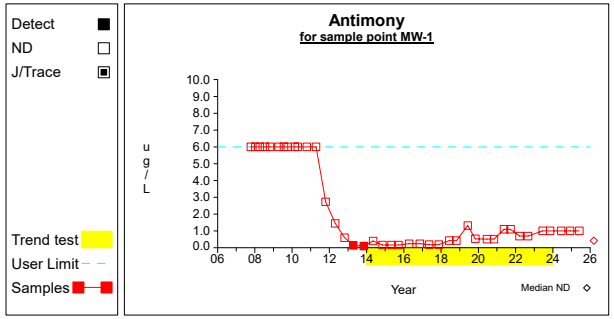
Step	Equation	Description
1	PL = max(X) = **1.41**	Compute nonparametric prediction limit as largest background measurement.
2	Conf = **0.99**	Confidence level is based on N, K and resampling strategy (see Gibbons 1994).

Worksheet 1 - Upgradient vs. Downgradient Comparisons
Silver (ug/L)
Nonparametric Prediction Limit

Step	Equation	Description
1	PL = max(X) = **1.24**	Compute nonparametric prediction limit as largest background measurement.
2	Conf = **0.99**	Confidence level is based on N, K and resampling strategy (see Gibbons 1994).

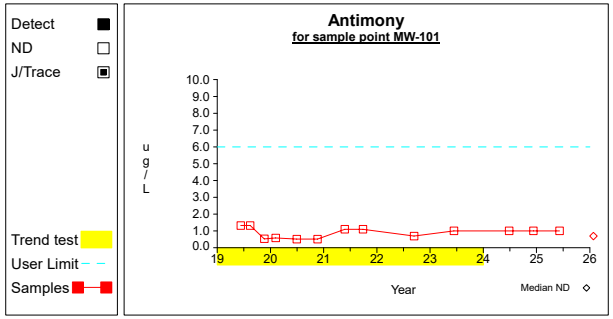
Worksheet 1 - Upgradient vs. Downgradient Comparisons
Thallium (ug/L)
Nonparametric Prediction Limit

Step	Equation	Description
1	PL = max(X) = **0.26**	Compute nonparametric prediction limit as largest background measurement.
2	Conf = **0.99**	Confidence level is based on N, K and resampling strategy (see Gibbons 1994).



Worksheet 1 - Upgradient vs. Downgradient Comparisons
Vanadium (ug/L)
Nonparametric Prediction Limit

Step	Equation	Description
1	PL = max(X) = **1.77**	Compute nonparametric prediction limit as largest background measurement.
2	Conf = **0.99**	Confidence level is based on N, K and resampling strategy (see Gibbons 1994).



Worksheet 1 - Upgradient vs. Downgradient Comparisons
Zinc (ug/L)
Nonparametric Prediction Limit

Step	Equation	Description
1	PL = max(X) = **18.6**	Compute nonparametric prediction limit as largest background measurement.
2	Conf = **0.99**	Confidence level is based on N, K and resampling strategy (see Gibbons 1994).

Zinc	0	27	0.000	5.310	5.310					2.326

* - Distribution override for that constituent.
Fit to distribution is confirmed if G <= critical value.
Model type may not match distributional form when detection frequency < 50%.

Table 4

Shapiro-Wilk Multiple Group Test of Normality

Constituent	Dist Form	Model Type
Antimony	non-norm	nonpar

Conf = confidence level for passing initial test or one of two verification resamples at all downgradient wells for a single constituent (nonparametric test only).
* - Insufficient Data.
** - Calculated limit raised to Manual Reporting Limit.
*** - Nonparametric limit based on ND value.
For transformed data, mean and SD in transformed units and prediction limit in original units.
All sample sizes and statistics are based on outlier free data.
For nonparametric limits, median reporting limits are substituted for extreme reporting limit values.

Table 6

Dixon's Test Outliers
1% Significance Level

Constituent	Units	Well	Date	Result	ND Qualifier	Date Range	N	Critical Value

N = Total number of independent measurements in background at each well.
Date Range = Dates of the first and last measurements included in background at each well.
Critical Value depends on the significance level and on N-1 when the two most extreme values are tested or N for the most extreme value.

Table 7

Censored Data Outliers Test

ND = Not Detected, Result = detection limit.

Worksheet 1 - Upgradient vs. Downgradient Comparisons
Antimony (ug/L)
Nonparametric Prediction Limit

Step	Equation	Description
1	PL = median(X) = **0.69**	Compute nonparametric prediction limit as median reporting limit in background.
2	Conf = **0.99**	Confidence level is based on N, K and resampling strategy (see Gibbons 1994).

Worksheet 1 - Upgradient vs. Downgradient Comparisons
Arsenic (ug/L)
Nonparametric Prediction Limit

Step	Equation	Description
1	PL = max(X) = **4.57**	Compute nonparametric prediction limit as largest background measurement.
2	Conf = **0.99**	Confidence level is based on N, K and resampling strategy (see Gibbons 1994).

Worksheet 1 - Upgradient vs. Downgradient Comparisons
Barium (ug/L)
Lognormal Prediction Limit

Step	Equation	Description
1	$Y = \log_e(X)$	Transform to natural logarithmic scale.
2	$\overline{Y}$ = **sum[Y]** / **N** = **132.654** / **27** = **4.913**	Compute mean on a natural log scale.
3	$S_Y = ((\mathbf{sum[Y^2]} - \mathbf{sum[Y]}^2/\mathbf{N}) / (\mathbf{N}-1))^{1/2}$ $= ((\mathbf{654.429} - \mathbf{17596.983}/\mathbf{27}) / (\mathbf{27}-1))^{1/2}$ = **0.322**	Compute sd on a natural log scale.
4	alpha = min[$(1-.95^{1/\mathbf{K}})^{1/3}$, .01] = min[$(1-.95^{1/\mathbf{378}})^{1/3}$, .01] = **0.01**	Adjusted per comparison false positive rate. Pass initial or 1 of 2 resamples.
5	PL = exp[$\overline{\mathbf{Y}}$ + $\mathbf{tS_Y}(1+1/\mathbf{N})^{1/2}$] = exp[**4.913** + (**2.478*****0.322**)(1+1/**27**)$^{1/2}$] = **306.316**	One-sided lognormal prediction limit (t is Student's t on N-1 degrees of freedom and 1-alpha confidence level).

Worksheet 1 - Upgradient vs. Downgradient Comparisons
Beryllium (ug/L)
Nonparametric Prediction Limit

Step	Equation	Description
1	PL = median(X) = **0.27**	Compute nonparametric prediction limit as median reporting limit in background.
2	Conf = **0.99**	Confidence level is based on N, K and resampling strategy (see Gibbons 1994).

Worksheet 1 - Upgradient vs. Downgradient Comparisons
Cadmium (ug/L)
Nonparametric Prediction Limit

Step	Equation	Description
1	PL = max(X) = **0.209**	Compute nonparametric prediction limit as largest background measurement.
2	Conf = **0.99**	Confidence level is based on N, K and resampling strategy (see Gibbons 1994).

Worksheet 1 - Upgradient vs. Downgradient Comparisons
Chromium (ug/L)
Nonparametric Prediction Limit

Step	Equation	Description
1	PL = max(X) = **1.1**	Compute nonparametric prediction limit as largest background measurement.
2	Conf = **0.99**	Confidence level is based on N, K and resampling strategy (see Gibbons 1994).

Worksheet 1 - Upgradient vs. Downgradient Comparisons
Cobalt (ug/L)
Nonparametric Prediction Limit

Step	Equation	Description
1	PL = max(X) = **0.681**	Compute nonparametric prediction limit as largest background measurement.
2	Conf = **0.99**	Confidence level is based on N, K and resampling strategy (see Gibbons 1994).

Worksheet 1 - Upgradient vs. Downgradient Comparisons
Copper (ug/L)
Nonparametric Prediction Limit

Step	Equation	Description
1	PL = max(X) = **5.27**	Compute nonparametric prediction limit as largest background measurement.
2	Conf = **0.99**	Confidence level is based on N, K and resampling strategy (see Gibbons 1994).

Worksheet 1 - Upgradient vs. Downgradient Comparisons
Field pH (SU)
Normal Prediction Limit

Step	Equation	Description
1	$\overline{X}$ = **sum[X]** / **N** = **182.31** / **26** = **7.012**	Compute upgradient mean.
2	S = ((**sum[X^2]** - **sum[X]**^{2}/**N**) / (**N**-1))^{½} = ((**1282.816** - **33236.936**/**26**) / (**26**-1))^{½} = **0.423**	Compute upgradient sd.
3	alpha = min[(1-.95$^{1/\mathbf{K}}$)$^{1/3}$, .01] = min[(1-.95$^{1/\mathbf{378}}$)$^{1/3}$, .01] = **0.01**	Adjusted per comparison false positive rate. Pass initial or 1 of 2 resamples.
4	PL = $\overline{\mathbf{X}}$ + **tS**(1+1/**N**)^{½} = **7.012** + (**2.485*****0.423**)(1+1/**26**)^{½} = **8.083**	One-sided normal prediction limit (t is Student's t on N-1 degrees of freedom and 1-alpha confidence level).

Worksheet 1 - Upgradient vs. Downgradient Comparisons
Field Specific Conductance (umhos/cm)
Lognormal Prediction Limit

Step	Equation	Description
1	$Y = \log_e(X)$	Transform to natural logarithmic scale.
2	$\overline{Y}$ = **sum[Y]** / **N** = **169.714** / **26** = **6.527**	Compute mean on a natural log scale.
3	$S_Y = ((\mathbf{sum[Y^2]} - \mathbf{sum[Y]}^2/\mathbf{N}) / (\mathbf{N}-1))^{1/2}$ $= ((\mathbf{1110.1} - \mathbf{28802.857}/\mathbf{26}) / (\mathbf{26}-1))^{1/2}$ = **0.303**	Compute sd on a natural log scale.
4	alpha = min[$(1-.95^{1/\mathbf{K}})^{1/3}$, .01] = min[$(1-.95^{1/\mathbf{378}})^{1/3}$, .01] = **0.01**	Adjusted per comparison false positive rate. Pass initial or 1 of 2 resamples.
5	PL = exp[$\overline{\mathbf{Y}}$ + $\mathbf{tS_Y}(1+1/\mathbf{N})^{1/2}$] = exp[**6.527** + (**2.485*****0.303**)(1+1/**26**)$^{1/2}$] = **1473.096**	One-sided lognormal prediction limit (t is Student's t on N-1 degrees of freedom and 1-alpha confidence level).

Worksheet 1 - Upgradient vs. Downgradient Comparisons
Lead (ug/L)
Nonparametric Prediction Limit

Step	Equation	Description
1	PL = max(X) = **1.06**	Compute nonparametric prediction limit as largest background measurement.
2	Conf = **0.99**	Confidence level is based on N, K and resampling strategy (see Gibbons 1994).

Worksheet 1 - Upgradient vs. Downgradient Comparisons
Nickel (ug/L)
Nonparametric Prediction Limit

Step	Equation	Description
1	PL = max(X) = **20.9**	Compute nonparametric prediction limit as largest background measurement.
2	Conf = **0.99**	Confidence level is based on N, K and resampling strategy (see Gibbons 1994).

Worksheet 1 - Upgradient vs. Downgradient Comparisons
Selenium (ug/L)
Nonparametric Prediction Limit

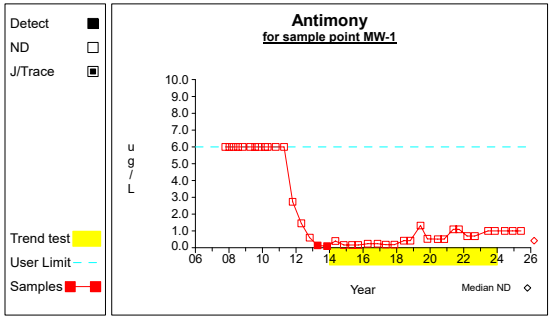
Step	Equation	Description
1	PL = max(X) = **1.41**	Compute nonparametric prediction limit as largest background measurement.
2	Conf = **0.99**	Confidence level is based on N, K and resampling strategy (see Gibbons 1994).

Worksheet 1 - Upgradient vs. Downgradient Comparisons
Silver (ug/L)
Nonparametric Prediction Limit

Step	Equation	Description
1	PL = max(X) = **0.37**	Compute nonparametric prediction limit as largest background measurement.
2	Conf = **0.99**	Confidence level is based on N, K and resampling strategy (see Gibbons 1994).

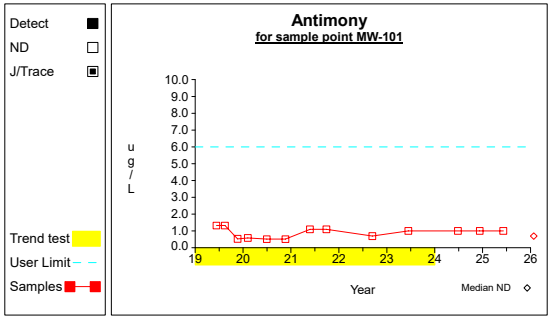
Worksheet 1 - Upgradient vs. Downgradient Comparisons
Thallium (ug/L)
Nonparametric Prediction Limit

Step	Equation	Description
1	PL = max(X) = **0.26**	Compute nonparametric prediction limit as largest background measurement.
2	Conf = **0.99**	Confidence level is based on N, K and resampling strategy (see Gibbons 1994).



Worksheet 1 - Upgradient vs. Downgradient Comparisons
Vanadium (ug/L)
Nonparametric Prediction Limit

Step	Equation	Description
1	PL = max(X) = **1.1**	Compute nonparametric prediction limit as largest background measurement.
2	Conf = **0.99**	Confidence level is based on N, K and resampling strategy (see Gibbons 1994).



Worksheet 1 - Upgradient vs. Downgradient Comparisons
Zinc (ug/L)
Nonparametric Prediction Limit

Step	Equation	Description
1	PL = median(X) = **10.0**	Compute nonparametric prediction limit as median reporting limit in background.
2	Conf = **0.99**	Confidence level is based on N, K and resampling strategy (see Gibbons 1994).

Vanadium	ug/L	0	25					0.8500	nonpar	***	0.99
Zinc	ug/L	0	25					10.0000	nonpar	***	0.99

Conf = confidence level for passing initial test or one of two verification resamples at all downgradient wells for a single constituent (nonparametric test only).
* - Insufficient Data.
** - Calculated limit raised to Manual Reporting Limit.
*** - Nonparametric limit based on ND value.
For transformed data, mean and SD in transformed units and prediction limit in original units.
All sample sizes and statistics are based on outlier free data.
For nonparametric limits, median reporting limits are substituted for extreme reporting limit values.

Table 6

Dixon's Test Outliers
1% Significance Level

Constituent	Units	Well	Date	Result	ND Qualifier	Date Range	N	Critical Value

N = Total number of independent measurements in background at each well.
Date Range = Dates of the first and last measurements included in background at each well.
Critical Value depends on the significance level and on N-1 when the two most extreme values are tested or N for the most extreme value.

Table 7

Censored Data Outliers Test
for datasets with 75% or more NDs

Constituent	Units	Well	Date	Result	Detects	N	% >= PQL	% >= MDL	Manual RL	Median	>= Med
Beryllium	ug/L	MW-19	09/16/2015	0.0400	1	25	4	4	no	0.2700	no

Zinc	ug/L	MW-11	12/17/2018		82.8000	*	10.0000
Zinc	ug/L	MW-11	06/03/2021		140.0000	*	10.0000
Zinc	ug/L	MW-11	08/03/2021		70.1000	*	10.0000
Zinc	ug/L	MW-11	09/07/2022		146.0000	*	10.0000
Zinc	ug/L	MW-11	06/20/2023		98.5000	*	10.0000
Zinc	ug/L	MW-11	07/01/2024		60.0000	*	10.0000

* - Significantly increased over background.
** - Detect at limit for 100% NDs in background (NPPL only).
*** - Manual exclusion.
ND = Not Detected, Result = detection limit.

Worksheet 1 - Upgradient vs. Downgradient Comparisons
Antimony (ug/L)
Nonparametric Prediction Limit

Step	Equation	Description
1	PL = median(X) = **0.53**	Compute nonparametric prediction limit as median reporting limit in background.
2	Conf = **0.99**	Confidence level is based on N, K and resampling strategy (see Gibbons 1994).

Worksheet 1 - Upgradient vs. Downgradient Comparisons
Arsenic (ug/L)
Nonparametric Prediction Limit

Step	Equation	Description
1	PL = max(X) = **9.23**	Compute nonparametric prediction limit as largest background measurement.
2	Conf = **0.99**	Confidence level is based on N, K and resampling strategy (see Gibbons 1994).

Worksheet 1 - Upgradient vs. Downgradient Comparisons
Barium (ug/L)
Nonparametric Prediction Limit

Step	Equation	Description
1	PL = max(X) = **2080.0**	Compute nonparametric prediction limit as largest background measurement.
2	Conf = **0.99**	Confidence level is based on N, K and resampling strategy (see Gibbons 1994).

Worksheet 1 - Upgradient vs. Downgradient Comparisons
Beryllium (ug/L)
Nonparametric Prediction Limit

Step	Equation	Description
1	PL = max(X) = **0.27**	Compute nonparametric prediction limit as largest background measurement.
2	Conf = **0.99**	Confidence level is based on N, K and resampling strategy (see Gibbons 1994).

Worksheet 1 - Upgradient vs. Downgradient Comparisons
Cadmium (ug/L)
Nonparametric Prediction Limit

Step	Equation	Description
1	PL = max(X) = **0.12**	Compute nonparametric prediction limit as largest background measurement.
2	Conf = **0.99**	Confidence level is based on N, K and resampling strategy (see Gibbons 1994).

Worksheet 1 - Upgradient vs. Downgradient Comparisons
Chromium (ug/L)
Nonparametric Prediction Limit

Step	Equation	Description
1	PL = max(X) = **1.1**	Compute nonparametric prediction limit as largest background measurement.
2	Conf = **0.99**	Confidence level is based on N, K and resampling strategy (see Gibbons 1994).

Worksheet 1 - Upgradient vs. Downgradient Comparisons
Cobalt (ug/L)
Nonparametric Prediction Limit

Step	Equation	Description
1	PL = max(X) = **5.62**	Compute nonparametric prediction limit as largest background measurement.
2	Conf = **0.99**	Confidence level is based on N, K and resampling strategy (see Gibbons 1994).

Worksheet 1 - Upgradient vs. Downgradient Comparisons
Copper (ug/L)
Nonparametric Prediction Limit

Step	Equation	Description
1	PL = max(X) = **7.64**	Compute nonparametric prediction limit as largest background measurement.
2	Conf = **0.99**	Confidence level is based on N, K and resampling strategy (see Gibbons 1994).

Worksheet 1 - Upgradient vs. Downgradient Comparisons
Lead (ug/L)
Nonparametric Prediction Limit

Step	Equation	Description
1	PL = max(X) = **3.25**	Compute nonparametric prediction limit as largest background measurement.
2	Conf = **0.99**	Confidence level is based on N, K and resampling strategy (see Gibbons 1994).

Worksheet 1 - Upgradient vs. Downgradient Comparisons
Nickel (ug/L)
Nonparametric Prediction Limit

Step	Equation	Description
1	PL = max(X) = **37.6**	Compute nonparametric prediction limit as largest background measurement.
2	Conf = **0.99**	Confidence level is based on N, K and resampling strategy (see Gibbons 1994).

Worksheet 1 - Upgradient vs. Downgradient Comparisons
Selenium (ug/L)
Nonparametric Prediction Limit

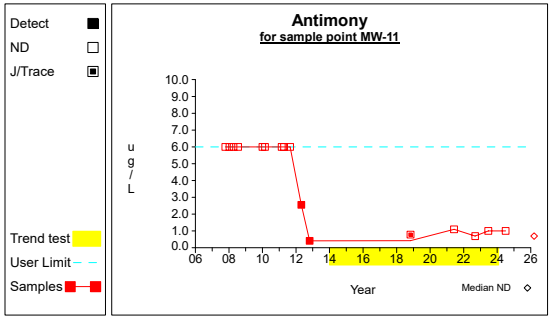
Step	Equation	Description
1	PL = median(X) = **0.96**	Compute nonparametric prediction limit as median reporting limit in background.
2	Conf = **0.99**	Confidence level is based on N, K and resampling strategy (see Gibbons 1994).

Worksheet 1 - Upgradient vs. Downgradient Comparisons
Silver (ug/L)
Nonparametric Prediction Limit

Step	Equation	Description
1	PL = max(X) = **1.24**	Compute nonparametric prediction limit as largest background measurement.
2	Conf = **0.99**	Confidence level is based on N, K and resampling strategy (see Gibbons 1994).

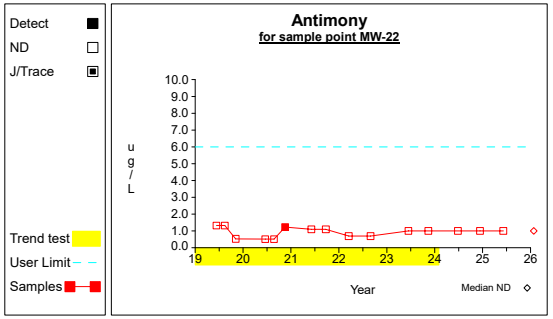
Worksheet 1 - Upgradient vs. Downgradient Comparisons
Thallium (ug/L)
Nonparametric Prediction Limit

Step	Equation	Description
1	PL = max(X) = **0.26**	Compute nonparametric prediction limit as largest background measurement.
2	Conf = **0.99**	Confidence level is based on N, K and resampling strategy (see Gibbons 1994).



Worksheet 1 - Upgradient vs. Downgradient Comparisons
Vanadium (ug/L)
Nonparametric Prediction Limit

Step	Equation	Description
1	PL = median(X) = **0.85**	Compute nonparametric prediction limit as median reporting limit in background.
2	Conf = **0.99**	Confidence level is based on N, K and resampling strategy (see Gibbons 1994).



Worksheet 1 - Upgradient vs. Downgradient Comparisons
Zinc (ug/L)
Nonparametric Prediction Limit

Step	Equation	Description
1	PL = median(X) = **10.0**	Compute nonparametric prediction limit as median reporting limit in background.
2	Conf = **0.99**	Confidence level is based on N, K and resampling strategy (see Gibbons 1994).

RE: Winneshiek Statistical Analysis - Fall 2025 Evaluation

1 Memorandum Organization

This memo addresses the statistical analysis of the groundwater monitoring data collected in October 2025. The statistical methods and results are summarized, with the memo organization given as follows:

Page
1 Memorandum Organization 1
2 Background 3
3 Statistical Methodology 6
3.1 Background Data Set 7
3.2 Data Set Adjustments Due to Changes in Sampling Methods 7
3.3 Background Data Set Adjustments 7
3.3.1 Data Set Adjustments due to Replacement 7

2 Background

The groundwater monitoring locations and status of the Appendix I and II sampling schedules are summarized in Table 1. The Appendix I and II analytical results will be provided in the 2025 Annual Water Quality Report (AWQR).

Table 1
Surface Water Monitoring Locations and Sampling Schedule
Oct./Nov. 2014 – Oct. 2025 Appendix I Data

Monitoring Location	Monitoring Program	Current Schedule [1] (Oct. 2025)	Appendix I Initiated	# Events to Complete Baseline Appendix I or Completion Date [113.10(5)b]	Appendix II Initiated
Downstream Monitoring Locations					
SW-2	Detection	Appendix I	Dec-11	Aug-12	N/A
SW-5	Detection	Appendix I	Jun-23	Jun-24	N/A
Upstream Monitoring Locations					
SW-1	Background	Dry	Apr-12	Jun-14	N/A

N/A = not applicable

[1] In addition to the Appendix I list, surface water locations were also analyzed for the geochemical parameters as outlined in the *2024 ACM Report* (AECOM, 2025) in Oct. 2025. As indicated in the *Remedial Selection Report* (Foth, 2025), continued monitoring of geochemical parameters at the surface water monitoring locations was not recommended.

N/A = not applicable

[1] GU-1, GU-2, MW-24A, and MW-101 were dry or had insufficient volume for sample collection; therefore, GU-1, GU-2, MW-24, and MW-101 were not included in this Fall 2025 statistical evaluation. Appendix II locations were sampled for the Appendix I and detected Appendix II constituents in Oct. 2025, with the exceptions of MW-7A and MW-46. MW-7A and MW-46A moved to assessment monitoring in Summer 2023 and Fall 2024, respectively; however, MW-7A has only undergone one complete Appendix II sampling event, and MW-46A had yet to be sampled for the full Appendix II list. Therefore, MW-7A and MW-46A were sampled for the full Appendix II list in Oct. 2025. The Appendix II resampling event schedule will be provided in Table 2 of the 2025 AWQR.

[2] In Oct. 2025, groundwater monitoring locations sampled were also analyzed for the geochemical parameters as outlined in the 2024 ACM Report (AECOM, 2025). As indicated in the *Remedial Selection Report* (Foth, 2025), biennial monitoring of geochemical parameters will be conducted at the corrective action, delineation, and background monitoring locations. The Iowa Department of Natural Resources (IDNR) approved the *Remedial Selection Report* (Foth, 2025) in their letter dated Jan. 6, 2026 (IDNR, 2026). The next biennial geochemical monitoring event will occur in Fall 2027.

[3] For the downgradient and background monitoring locations where monitoring was initiated before 2014, sampling methods were modified from high-volume to low-flow sampling starting in Oct./Nov. 2014. Five rounds of baseline Appendix I monitoring were re-initiated between Oct./Nov. 2014 and Nov. 2016, with the exceptions of MW-24A and MW-25A. MW-24A and MW-25A were dry in Sep. 2015, and MW-24A was dry again in Nov. 2017; therefore, MW-24A and MW-25A completed baseline Appendix I monitoring in Jun. 2018 and May 2017, respectively. The high-volume results collected before Oct./Nov. 2014 were removed before conducting statistical analyses.

[4] MW-7 triggered assessment monitoring in Summer 2023. One round of baseline assessment monitoring for the full Appendix II list was conducted in Jun. 2024, and none of the Appendix II constituents not in the Appendix I list were detected during the initial assessment monitoring event. MW-7A was sampled for the annual full Appendix II list in Oct. 2025.

[5] MW-46A triggered assessment monitoring in Fall 2024. One round of baseline assessment monitoring for the full Appendix II list was conducted in Oct. 2025.

[6] Baseline Appendix I and Appendix II monitoring is not applicable for delineation monitoring wells; however, MW-39A, MW-42A, MW-43A, and MW-44A were previously sampled as part of the detection/assessment monitoring programs. These locations moved to delineation monitoring in the Fall 2025 sampling event as requested in the *Remedial Selection Report* (Foth, 2025) and approved by the IDNR in their letter dated Jan. 6, 2026 (IDNR, 2026).

[7] MW-1 was in background monitoring until chlorobenzene was detected at MW-1 in Oct. 2008, triggering assessment monitoring. One round of baseline assessment monitoring for the full Appendix II list was conducted in Jul. 2010, and none of the Appendix II constituents not in the Appendix I list were detected during the initial assessment monitoring. MW-1 was sampled for the Appendix II list again in May 2014, and several constituents were detected at low levels (beta-BHC, endosulfan II, diethyl phthalate, and di-n-octyl phthalate), and one constituent was detected above the PQL (methoxychlor). Quarterly monitoring for only the detected Appendix II constituents (beta-BHC, endosulfan II, methoxychlor, diethyl phthalate, and di-n-octyl phthalate) was conducted in Jun. 2014, Nov. 2014, and Dec. 2014. The full Appendix II list was sampled at MW-1 in Sep. 2015 for annual monitoring, and one quarterly sample for the additional low-level detected Appendix II constituents (4,4'-DDE, 4,4'-DDT, alpha-BHC, delta-BHC, dieldrin, endosulfan sulfate, endrin, gamma-BHC, and heptachlor) was conducted in Dec. 2015. MW-1 moved back to detection monitoring in 2018 in accordance with 567 IAC 113.10(6)e, and returned to background monitoring in 2020.

Table 3
Deep Groundwater Locations and Sampling Schedule
Oct./Nov. 2014 – Oct. 2025 Appendix I & II Data

Monitoring Location	Monitoring Program	Current Schedule [1,2] (Oct. 2025)	Appendix I Initiated	# Events to Complete Baseline Appendix I or Completion Date [113.10(5)b]	Appendix II Initiated
Downgradient Monitoring Locations					
MW-11	Assessment	Dry	Oct-07	Dec-09	N/A
			Oct-18 [3]	Jul-24 [3]	Jun-23 [4]
MW-22	Detection	Dry	Jun-19	Aug-20	N/A
MW-35	Corrective Action	Appendix II	Nov-19	Nov-20	Nov-20
Background Monitoring Locations					
MW-18	Background	Appendix I	Jul-24	Oct-25	N/A
MW-19R [5]	Background	Appendix II	Sep-21	Aug-22	N/A

[1] MW-11 and MW-22 were dry or had insufficient volume for sample collection; therefore, MW-11 and MW-22 were not included in this Fall 2025 statistical evaluation. Appendix II locations were sampled for the Appendix I and detected Appendix II constituents in Oct. 2025. The Appendix II resampling event schedule will be provided in Table 2 of the 2025 AWQR.

[2] In Oct. 2025, groundwater monitoring locations sampled were also analyzed for the geochemical parameters as outlined in the 2024 ACM Report (AECOM, 2025). As indicated in the *Remedial Selection Report* (Foth, 2025), biennial monitoring of geochemical parameters will be conducted at the corrective action, delineation, and background monitoring locations. The IDNR approved the *Remedial Selection Report* (Foth, 2025) in their letter dated Jan. 6, 2026 (IDNR, 2026). The next biennial geochemical monitoring event will occur in Fall 2027.

[3] For the downgradient and background monitoring locations where monitoring was initiated before 2014, sampling methods were modified from high-volume to low-flow sampling starting in Oct./Nov. 2014, with the exception of MW-11. Five rounds of baseline Appendix I monitoring were re-initiated between Oct/Nov. 2014 and Nov. 2016, with the exception of MW-11. MW-11 was dry Apr. 2013 through Jun. 2018, Jun. 2019 through Nov. 2020, Sep. 2021 through June. 22, and Nov. 2024 through Oct. 2025 (see footnote 4); therefore, baseline Appendix I monitoring could not be initiated until Oct. 2018 and was completed in Jul. 2024. The high-volume results collected before Oct./Nov. 2014 were removed before conducting statistical analyses.

[4] MW-11 moved to assessment monitoring in Apr. 2013; however, the well was dry and remained dry through Jun. 2018. MW-11 was sampled for the first time since moving to assessment monitoring in Oct. 2018 for the Appendix I list. AECOM requested continued Appendix I monitoring for four additional semiannual events to collect sufficient sampling data to determine whether the concentrations are due to the landfill or are naturally occurring (AECOM, 2019), and the IDNR approved the request in their letter dated Jun. 14, 2019 (IDNR, 2019). Baseline assessment monitoring for the full Appendix II list was initiated in Jun. 2023, and none of the Appendix II constituents not in the Appendix I list were detected during the initial monitoring event.

[5] MW-19R was installed in Sep. 2021 to replace MW-19, which was abandoned due to failure of the annular space seal. MW-19R was installed adjacent to MW-19. The MW-19 and MW-19R data sets were initially combined. See Section 3.1 for more details on the background data set.

In October 2025, semiannual detection, assessment, corrective action, delineation, and background monitoring were conducted at the surface water, shallow groundwater, and deep groundwater locations listed in Tables 1, 2, and 3, respectively. Assessment, corrective action monitoring, and background locations were sampled for the Appendix I and detected Appendix II constituents in October 2025, with the exception of background location MW-18. MW-18 was sampled for the Appendix I list in October 2025 and will be sampled for the Appendix I and detected Appendix II constituents going forward. In accordance with 567 Iowa Administrative Code (IAC) 113.10(6)b and Permit Special Provision X.4.b, MW-7A and MW-46A were sampled for the full Appendix II list in

October 2025. In accordance with Permit Special Provision X.4.b, resampling for the full Appendix II list at the assessment, corrective action, and background monitoring wells is conducted every five years. The next full Appendix II resampling dates will be provided in Table 2 of the 2025 AWQR.

Under the detection and assessment monitoring programs of 567 IAC 113.10(5) and 113.10(6), Appendix I and II monitoring results are statistically compared to background levels as given in 567 IAC 113.10(6)e and to the groundwater protection standard (GWPS) as given in 567 IAC 113.10(6)g and h. A well may return to detection monitoring when all Appendix II constituents are "shown to be at or below background values, using the statistical procedures in paragraph 113.10(4)g for two consecutive sampling events." Consequently, to return to detection monitoring in accordance with 567 IAC 113.10(6)e, all Appendix II constituents must be below the interwell prediction limit (for constituents that are detected in the background data set) or below the laboratory reporting limit (for constituents which are not detected in the background data set) during two consecutive sampling events. However, three consecutive sampling events may be utilized to determine whether to return to detection monitoring to limit the frequent fluctuation of wells moving between the detection and assessment monitoring programs. Assessment monitoring continues when Appendix II concentrations are above background values but below the GWPS using the statistical procedures in paragraph 113.10(4)g.

If Appendix II constituents are detected at statistically significant levels (SSLs) above the GWPS, characterization [567 IAC 113.10(6)g] is initiated and the owners or operators are required to begin an assessment of corrective measures, select a remedy, and implement a remedy in accordance with 567 IAC 113.10(7), (8), and (9). For remedy completion [567 IAC 113.10(9)e(2)], compliance with the GWPS is considered achieved by demonstrating that concentrations of Appendix II constituents have not exceeded the GWPS for a period of three consecutive years or an alternate length of time established by the IDNR.

Based on the October 2014 through October 2025 results, this memo presents an evaluation of statistically significant increases (SSIs) and SSLs under the requirements of paragraphs 113.10(4)g and h of 567 IAC.

3 Statistical Methodology

The statistical methods utilized for locations in detection, assessment, corrective action, and delineation monitoring were consistent with the methods outlined in the approved *2024 UPDATE Winneshiek Hydrologic Monitoring System Plan* (HMSP) (AECOM, 2024). Deviations from the HMSP are listed below. The HMSP will be updated with the permit renewal application in 2026 to reflect these changes. Detailed descriptions of the statistical methods are provided in Attachment 1. Sanitas® v10.1 (Sanitas Technologies) software was utilized to complete statistical comparisons.

The following deviations from the HMSP were implemented during this statistical evaluation (Fall 2025):

- As further discussed in Section 3.3.1, MW-1 and MW-19 were removed from the shallow and deep groundwater background data sets, respectively.
- As further addressed in Section 3.1, background for interwell prediction limits was pooled from October/November 2014 through the most recent monitoring event.
- As addressed in Section 3.3.4, the PQL was used as the reporting limit.

- Per the *Statistical Analysis of Groundwater Monitoring Data at RCRA Facilities* (USEPA, 2009), to check distributional assumptions when calculating prediction limits and confidence intervals, the Kaplan-Meier adjustment will be applied when there are 50% to 85% detects in the background data set. Statistical Methodology is provided as Attachment 1.

Note that statistical comparisons were not conducted at shallow groundwater locations GU-1, GU-2, MW-24A, and MW-101 and at deep groundwater locations MW-11 and MW-22 since these locations were dry or had insufficient volume for sample collection in October 2025.

3.1 Background Data Set

The interwell background data sets consist of upgradient surface water monitoring location SW-1, shallow groundwater background locations MW-1 and MW-37A, and deep groundwater background locations MW-18 and MW-19R.

As further addressed in Section 3.3.1, MW-1R and MW-19 were previously included in the shallow and deep groundwater background data sets, respectively. However, MW-1R and MW-19 are recommended for removal from their respective background data sets.

As further addressed in Section 3.2, the background data sets previously included data from October/November 2014 through the end of the preceding year. Hereafter, utilizing background from October/November 2014 through the most recent monitoring event is recommended. Background data set adjustments are addressed in Section 3.3.

3.2 Data Set Adjustments Due to Changes in Sampling Methods

For the downgradient and background monitoring locations where monitoring was initiated before October/November 2014, the sampling methodology was modified from high-volume to low-flow or no-purge sampling starting in October/November 2014. The high-volume results collected before October/November 2014 were removed before conducting statistical analyses. These data set removals were maintained in the current statistical evaluation. The removed data will be listed as crossed-out concentrations in Table 14 of the 2025 AWQR.

3.3 Background Data Set Adjustments

3.3.1 Data Set Adjustments due to Replacement

MW-1R Removal from Background

Previously, historical data from MW-1R was included in the shallow groundwater background data set. MW-1R was installed in April 2010 after MW-1 moved to assessment monitoring. However, MW-1R was installed in a crop field on the adjoining property to the west and was mostly inaccessible from November 2017 through September 2021, when MW-1R was abandoned. MW-37A was installed in September 2021 to replace MW-1R. Since MW-1R's contribution to shallow groundwater background is minimal due to inaccessibility, and further data set removals would likely be required due to volatile organic compound (VOC) detections, removal of the historical MW-1R data from the combined shallow groundwater background data set is recommended.

MW-19 Removal from Background

From June to October 2019, groundwater levels at MW-19 increased approximately 15 feet, which was attributed to annular seal failure. MW-19 was abandoned in August 2021, and MW-19R was installed in September 2021 as its replacement. The data sets for MW-19 and MW-19R were initially

combined; however, due to the seal failure, removal of the June 2019 through May 2021 metals data at MW-19 was recommended and approved by the IDNR in their letter dated May 2, 2023 (IDNR, 2023). With four years of monitoring data now available from MW-19R, retaining the limited historical MW-19 data no longer provides meaningful ongoing value. Therefore, removal of the historical MW-19 data from the combined deep groundwater background data set is recommended.

3.3.2 Adjustments Associated with Total Suspended Solids

A review of the total suspended solids (TSS) results in background was completed for the October/November 2014 through current (October 2025) sampling event data at MW-1, MW-18, MW-19R, and MW-37A. The evaluation was conducted by identifying elevated TSS results (above 100 mg/L) and examining corresponding metal results to determine whether a correlation was present. When a correlation was evident, the detected metals for the event were considered for removal.

Based on this review, no background data set adjustments are recommended for background wells MW-18 based on a review of TSS data. The following data set adjustments are recommended based on the evaluation. The removed background data will be listed as crossed-out concentrations in Table 14 of the 2025 AWQR.

- Removal of the September 2021 barium, cobalt, lead, and nickel concentrations in MW-19R due to elevated TSS (182 mg/L) and the potential for turbidity to contribute to the higher metal concentrations identified.

- Removal of the September 2021 arsenic, barium, cadmium, chromium, cobalt, copper, lead, silver, and vanadium concentration in MW-37A due to the elevated TSS (159 mg/L) and the potential for turbidity to contribute to the higher metal concentrations identified.

- Removal of the March 2022 arsenic, barium, cadmium, chromium, cobalt, copper, lead, nickel, and vanadium concentrations in MW-19R due to the elevated TSS (834 mg/L) and the potential for turbidity to contribute to the higher metal concentrations identified.

- Removal of the June 2023 barium, cobalt, and copper concentrations in MW-19R due to elevated TSS (109 mg/L) and the potential for turbidity to contribute to the higher metal concentrations identified.

- Removal of the November 2023 arsenic, barium, cadmium, cobalt, copper, lead, nickel, and vanadium concentrations in MW-1 due to elevated TSS (276 mg/L) and the potential for turbidity to contribute to the higher metal concentrations identified.

- Removal of the October 2025 arsenic, barium, cobalt, and lead concentrations in MW-19R due to the elevated TSS (151 mg/L) and the potential for turbidity to contribute to the higher metal concentrations identified.

3.3.3 Review of Single Background Detections

<u>Shallow Groundwater</u>
A VOC detection was identified for chlorobenzene at MW-1 in November 2014. The November 2014 detected metals data (barium, cobalt, copper, nickel, and vanadium) at MW-1 were removed from the background data set due to the potential impact indicated by the VOC detection. A single VOC detection was identified for chlorobenzene in November 2023. In January 2024, a retest sample was collected, which confirmed the November 2023 detection. The November 2023 detected metals

(arsenic, barium, cadmium, cobalt, copper, lead, nickel, and vanadium) were previously removed due to elevated TSS observed during the event. Only one confirmed detection has been observed at MW-1, indicating MW-1 remains suitable for continued use as a background well. If chlorobenzene continues to be detected at MW-1, further assessment will be provided. VOCs are considered "never detected" constituents; therefore, chlorobenzene was not added as a prediction limit constituent. Downgradient chlorobenzene results continue to be evaluated using the Double Quantification Rule (DQR).

A single VOC detection was identified for acetone in MW-37A during the June 2024 sampling event. The June 2024 detected metals data (arsenic, barium, and cobalt) were considered for removal; however, acetone is a common laboratory contaminant, and arsenic, barium, and cobalt concentrations at MW-37 were within the historical range for the constituents. Therefore, arsenic, barium, and cobalt results at MW-37A during the June 2024 event were not removed from background. Acetone has not been observed at MW-37A outside of this event, indicating that MW-37A remains suitable for continued use as a background well. VOCs are considered "never detected" constituents; therefore, acetone was not added as a prediction limit constituent. Downgradient acetone results continue to be evaluated using the DQR.

A single VOC detection was identified for benzene in MW-37A during the December 2024 sampling event. The December 2024 detected metals data (arsenic, barium, cobalt, and nickel) were removed from the background data set due to the potential impact indicated by the VOC detection. Benzene was not detected at MW-37A during subsequent events, indicating that MW-37A remains suitable for continued use as a background well for shallow groundwater. VOCs are considered "never detected" constituents; therefore, benzene was not added as a prediction limit constituent. Downgradient benzene results continue to be evaluated using the DQR.

Deep Groundwater

A single VOC detection was identified for acetone in MW-19R during the September 2021 sampling event. The September 2021 detected metals data (barium, cobalt, lead, and nickel) were previously removed due to elevated TSS observed during the event. Acetone has not been observed at MW-19R outside of this event, indicating that MW-19R remains suitable for continued use as a background well. VOCs are considered "never detected" constituents; therefore, acetone was not added as a prediction limit constituent. Downgradient acetone results continue to be evaluated using the DQR.

3.3.4 Adjustments Associated with Reporting Limits

During prior statistical evaluations, the method detection limit (MDL) was utilized as the reporting limit. Starting with the current (Fall 2025) statistical evaluation, the reporting limit was used as the PQL. This change is consistent with the protocols for handling non-detect data outlined in the United States Environmental Protection Agency (USEPA) *Unified Guidance* (USEPA, 2009). Specifically, Section 6.3.4 of *Unified Guidance* (USEPA, 2009) indicates that "non-detect concentrations should not be assumed to be bounded above by the MDL" and suggests the use of the PQL for handling non-detect data. Note that while the laboratory PQL is utilized as the reporting limit for non-detect data, the laboratory continues to report actual estimated detections (i.e., detections above the MDL but below the PQL or J-flagged concentrations). Per USEPA recommendations (USEPA, 2009), substitutions are not conducted for J-flagged or estimated concentrations. These results are utilized at the reported estimated concentration even though the degree of uncertainty is probably greater than that associated with detections above the PQL (USEPA, 2009).

Note that Section 7.3 of the approved *2024 UPDATE Winneshiek Hydrologic Monitoring System Plan* indicates that "if a monitoring well's background for a given parameter contains more than 50 percent non-detects, a nonparametric prediction limit will be used to test the interwell compliance data against interwell background, and the reporting limit (RL) will be used for non-detect values to account for non-detects." This specifies the use of the PQL as the reporting limit for non-detect data. However, as described above and in Attachment 1, half the reporting limit was used for non-detect data starting with the current (Fall 2025) statistical evaluation. This method follows the Unified Guidance recommendations and is given in detail in Unified Guidance Chapter 15 (USEPA, 2009). The HMSP will be updated with the permit renewal application in 2026 to reflect this change.

The background data set and PQLs were reviewed in the current (Fall 2025) statistical evaluation. This consisted of reviewing the PQLs for metals constituents used in the interwell prediction limit evaluation to determine whether PQLs have been lowered over time and whether some of the earlier non-detect data with elevated PQLs should be removed from the background data due to the increased uncertainty it added. Non-detect background samples with a PQL of at least two times the maximum detected background concentration are recommended for removal. The background data set adjustments recommended and incorporated based on the review of PQLs includes:

- Removal of the non-detect cadmium results with a PQL of 0.0005 mg/L at SW-1.

The removed background data will be listed as a crossed-out concentration in Table 14 of the 2025 AWQR.

3.4 Outliers

The outliers flagged during prior statistical evaluations were maintained in the current (Fall 2025) evaluation. Outliers will be listed as o-flagged and as crossed-out concentrations in Table 14 of the 2025 AWQR. The outliers removed from the evaluation include:

- Barium at MW-4 in November 2017 (0.0406 mg/L);
- Cobalt at MW-35 in December 2024 (0.00198 mg/L);
- Cobalt at MW-44A June 2023 (0.000251 mg/L);
- Cobalt at MW-44A in November 2023 (0.000327 mg/L);
- Nickel at MW-101 in June 2020 (0.00461 mg/L);
- Nickel at MW-101 in September 2022 (0.000373 mg/L); and
- Nickel at MW-22 in June 2023 (0.00445 mg/L).

No outliers were flagged during the current (Fall 2025 statistical evaluation).

3.5 Corrective Action Constituents

In accordance with the Unified Guidance (USEPA, 2009), corrective action statistics are conducted for analyte/well pairs with previously identified SSLs, as listed in Table 4. No new corrective action constituents were added based on the results of the previous Spring 2025 statistical evaluation. In addition, no corrective action constituents exited corrective action and returned to an assessment constituent in Spring 2025.

Table 4
Corrective Action Constituents

Monitoring Location	Corrective Action Constituents [1]
Shallow Monitoring Locations	
MW-29A	Cobalt
MW-31A	Cobalt
MW-33A	Arsenic
MW-43A	Cobalt
Deep Monitoring Locations	
MW-35	Cobalt

[1] Corrective action constituents are analyte/well pairs with SSLs over the GWPS identified during previous statistical evaluations and have not achieved compliance with the GWPS for three consecutive years in accordance with 567 IAC 113.10(9)e(2).

Under corrective action statistics, comparisons to background are not conducted (unless the GWPS is the background value); therefore, the analyte/well pairs listed in Table 4 are not included in the Section 4 comparisons to background. As detailed in Attachment 1, corrective action statistics compare the upper confidence limit to the compliance standard to determine whether concentration levels are in compliance with the GWPS. In the case of decreasing concentrations, the upper confidence limit on a regression trend line is utilized. All other compliance constituents in the corrective action monitoring locations (i.e., those without SSLs over the GWPS during prior statistical evaluations) are evaluated using the assessment monitoring procedures.

4 Comparison to Background Levels

Comparisons to background levels were conducted using interwell prediction limits and the DQR. As noted in Section 3.4, comparisons to background were not conducted for the corrective action constituents listed in Table 4.

4.1 Interwell Prediction Limits

Interwell prediction limits were used for formal statistical assessment of SSIs over background at downgradient monitoring locations for analytes that have been detected above the reporting limit in the combined background data set (SW-1 for the surface water system; MW-1 and MW-37A in the shallow water table system; and MW-18 and MW-19R for the deep bedrock system). For surface water, these analytes included arsenic, barium, cadmium, cobalt, copper, lead, nickel, silver, thallium, vanadium, and zinc. For shallow groundwater, these analytes included arsenic, barium, cobalt, and nickel. For deep groundwater, these analytes included barium, cobalt, and silver.

4.1.1 Surface Water

The surface water prediction limits calculated utilizing the October/November 2014 through October 2025 sample data are summarized in Table 5. Detailed prediction limit output for each analyte/well pair is included in Attachment 2.

Table 5
Interwell Prediction Limit Summary – Surface Water
Oct./Nov. 2014 – Oct. 2025 Interwell Data [(1)]

Chemical Name	Prediction Limit	Units	Interwell Prediction Limit Type	Retesting Plan	Prediction Limit Method
Arsenic	0.00254	mg/L	Non-Parametric	1-of-2	Maximum Order Statistic
Barium	0.201	mg/L	Non-Parametric	1-of-2	Maximum Order Statistic
Cadmium	0.000228	mg/L	Non-Parametric	1-of-2	Maximum Order Statistic
Cobalt	0.00436	mg/L	Non-Parametric	1-of-2	Maximum Order Statistic
Copper	0.0115	mg/L	Non-Parametric	1-of-2	Maximum Order Statistic
Lead	0.00708	mg/L	Non-Parametric	1-of-2	Maximum Order Statistic
Nickel	0.00785	mg/L	Non-Parametric	1-of-2	Maximum Order Statistic
Silver	0.00136	mg/L	Non-Parametric	1-of-2	Maximum Order Statistic
Thallium	0.00467	mg/L	Non-Parametric	1-of-2	Maximum Order Statistic
Vanadium	0.007742	mg/L	Parametric (Lognormal with Kaplan-Meier Adjustment)	1-of-2	$\exp(\hat{\mu}_{KM} + k \cdot \hat{\sigma}_{KM})$
Zinc	0.0207	mg/L	Non-Parametric	1-of-2	Maximum Order Statistic

(1) Interwell data consists of the Appendix I parameters that have been detected in the background data set (SW-1). Note that background data set adjustments were incorporated in accordance with Sections 3.2 and 3.3.

Non-parametric prediction limits were used for arsenic, barium, cadmium, cobalt, copper, lead, nickel, silver, thallium, and zinc since either normality assumptions could not be met or there were less than 50% detects in the combined background data. A parametric lognormal prediction limit was used for vanadium since there were greater than 50% detects in the combined background data set, the assumptions of normality were met with a lognormal transformation, and the lognormal limit was accepted as being representative of the background distribution.

4.1.2 Shallow Groundwater

The shallow groundwater prediction limits calculated utilizing the October/November 2014 through October 2025 sample data are summarized in Table 6. Detailed prediction limit output for each analyte/well pair is included in Attachment 2.

Table 6
Interwell Prediction Limit Summary – Shallow Groundwater
Oct./Nov. 2014 – Oct. 2025 Interwell Data [(1)]

Chemical Name	Prediction Limit	Units	Interwell Prediction Limit Type	Retesting Plan	Prediction Limit Method
Arsenic	0.22	mg/L	Non-Parametric	1-of-2	Maximum Order Statistic
Barium	0.63	mg/L	Non-Parametric	1-of-2	Maximum Order Statistic
Cobalt	0.00272	mg/L	Non-Parametric	1-of-2	Maximum Order Statistic
Nickel	0.00927	mg/L	Non-Parametric	1-of-2	Maximum Order Statistic

(1) Interwell data consists of the Appendix I and II parameters that have been detected in the combined background data set (MW-1 and MW-37A). Note that background data set adjustments were incorporated in accordance with Sections 3.2 and 3.3.

Non-parametric prediction limits were used for arsenic, barium, cobalt, and nickel since either normality assumptions could not be met or there were less than 50% detects in the combined background data.

4.1.3 Deep Groundwater

The deep groundwater prediction limits calculated utilizing the October/November 2014 through October 2025 sample data are summarized in Table 7. Detailed prediction limit output for each analyte/well pair is included in Attachment 2.

Table 7
Interwell Prediction Limit Summary – Deep Groundwater
Oct./Nov. 2014 – Oct. 2025 Interwell Data [1]

Chemical Name [2]	Prediction Limit	Units	Interwell Prediction Limit Type	Retesting Plan	Prediction Limit Method
Barium	0.1906	mg/L	Parametric (Lognormal)	1-of-2	$exp(\bar{y} + k \cdot s_y)$
Silver	0.00124	mg/L	Non-Parametric	1-of-2	Maximum Order Statistic

[1] Interwell data consists of the Appendix I and II parameters that have been detected in the combined background data set (MW-18 and MW-19R). Note that background data set adjustments were incorporated in accordance with Sections 3.2 and 3.3.
[2] Cobalt is detected in the deep groundwater background data set; however, cobalt was not analyzed using interwell prediction limits this event, since downgradient wells MW-11 and MW-22 were not sampled, and cobalt is a corrective action constituent at MW-35 and is analyzed using confidence intervals in Section 5.

A non-parametric prediction limit was used for silver since there were less than 50% detects in the combined background data. A parametric lognormal prediction limit was used for barium since there were greater than 50% detects in the combined background data set, the assumptions of normality were met with a lognormal transformation, and the lognormal limit was accepted as being representative of the background distribution.

4.1.4 Prediction Limit Exceedances

No prediction limit exceedances were observed at the surface water monitoring locations during the October 2025 event. A summary of the monitoring locations exhibiting a prediction limit exceedance during the October 2025 event is given in Table 8 for the shallow groundwater system and Table 9 for the deep groundwater system. Detailed prediction limit output for each analyte/well pair is included in Attachment 2.

Table 8

4.2 Double Quantification Rule

The DQR was used to evaluate SSIs over background for the remaining Appendix I and II constituents (i.e., constituents not evaluated using interwell prediction limits and which have not been detected above the PQL in the interwell background data sets). The DQR output is included in Attachment 3, with a summary of the October 2025 DQR detections provided in Table 10 for surface water, Table 11 for shallow groundwater, and Table 12 for deep groundwater.

4.3 Summary of Comparison to Background

4.3.1 Surface Water Locations

No interwell prediction limit exceedances or DQR detections were identified at the downstream surface water monitoring locations SW-2 or SW-5 in October 2025.

4.3.2 Detection Monitoring Locations

For the shallow groundwater system, no interwell prediction limit exceedances or DQR detections were identified at MW-2R, MW-3, MW-4B, MW-25A, MW-34A, MW-38A, MW-41A, and MW-45A.

For the deep groundwater system, detection monitoring well MW-22 was not sampled in October 2025 as described in Table 3.

4.3.3 Assessment Monitoring Locations

For the shallow groundwater system, interwell prediction limit exceedances were identified at MW-4, MW-7A, MW-40A, and MW-46A as listed in Table 8. DQR detections were identified at MW-4 and MW-7A as listed in Table 11.

For the deep groundwater system, assessment monitoring well MW-11 was not sampled in October 2025 as described in Table 3.

4.3.3.1 Exiting Assessment Monitoring

As discussed in Section 1, assessment monitoring locations may return to detection monitoring when Appendix II constituents fall below the current interwell prediction limit (for constituents which are detected in the respective background data set) and below the laboratory reporting limit (for constituents which are not detected in the background data set) for three consecutive sampling events. Exiting assessment monitoring will be evaluated starting in the Spring 2026 statistical evaluation.

4.3.4 Corrective Action Monitoring Locations – Assessment Constituents

For the shallow groundwater system, no interwell prediction limit exceedances or DQR detections were identified for the assessment constituents at MW-33. Interwell prediction limit exceedances and/or DQR detections were identified for the assessment constituents in MW-29A and MW-31A as listed in Tables 8 and 11, respectively.

For the deep groundwater system, an interwell prediction limit exceedance and DQR detection were identified for assessment constituents in MW-35 as listed in Tables 9 and 12, respectively.

In lieu of retesting for the prediction limit exceedances and DQR detections, SSIs were declared and evaluated for SSLs in Section 5.

4.3.5 Delineation Monitoring Locations

Note: MW-39A, MW-42A, MW-43A, and MW-44A moved to delineation monitoring this Fall 2025 sampling event as requested in the *Remedial Selection Report* (Foth, 2025) and approved by the IDNR in their letter dated January 6, 2026 (IDNR, 2026). While these locations were sampled for the Appendix I list in October 2025, statistical comparisons were only conducted for the constituent the wells are delineating: cobalt. As previously noted, comparisons to background were not conducted for the corrective action constituents listed in Table 4, which included cobalt in MW-43A.

For the shallow groundwater system, no prediction limit exceedances were identified for cobalt at MW-39A, MW-42A, and MW-44A.

5 Comparison to Groundwater Protection Standard

The interwell prediction limit exceedances and DQR detections listed in Tables 8 through 12 were declared SSIs and evaluated for SSLs over the GWPS per 567 IAC 113.10(6)f and g. Comparisons to the GWPS were evaluated through statistical confidence intervals under the assessment monitoring null hypothesis. SSLs were declared to exist with statistical certainty when the lower confidence limit exceeds the GWPS.

In contrast, corrective action analyte/well pairs (i.e., those where SSLs have been previously declared) were evaluated to determine compliance with the GWPS per 567 IAC 113.10(9)e. A summary of the corrective action constituents was provided in Table 4. Comparisons to the GWPS in this case were evaluated through statistical confidence intervals under the corrective action monitoring null hypothesis. When downward trending data is identified, confidence bands (upper 95% confidence limits) placed around the linear trend line can be used for comparisons to the GWPS; however, significant decreasing linear trends were not identified at the corrective action constituent/well pairs during this (Fall 2025) evaluation. For corrective action constituents, compliance with the GWPS has been achieved with statistical certainty when the UCL or the upper 95% confidence limit on the trend line is lower than the GWPS for a period of three consecutive years or an alternate length of time established by the IDNR.

Statistical outputs for confidence intervals in assessment mode and confidence intervals in corrective action mode are included in Attachment 4.

5.1 Shallow Groundwater Background as the Arsenic and Cobalt GWPSs

With arsenic and cobalt, the concentrations in the interwell shallow groundwater background data set exceed the health-based GWPS values (i.e., the 40 Code of Federal Regulations [CFR] Part 141 Safe Drinking Water Act Maximum Contaminant Level [MCL] or the 567 IAC Chapter 137 Statewide Standard for a Protected Groundwater Source). Therefore, the GWPS for arsenic and cobalt in shallow groundwater is taken as background in accordance with 567 IAC 113.10(6)h.

Pursuant to 567 IAC 113.10(6)h, the GWPS for arsenic is taken as background and evaluated with the statistical methods described in Attachment 1 and as recommended in the *Unified Guidance* (USEPA, 2009). With background serving as the GWPS, the confidence limit is compared to the combined MW-1 and MW-37A background upper tolerance limit with 95% confidence and 95% coverage. Statistical output for the arsenic tolerance limit is included in Attachment 5. Using the described methods, the shallow groundwater arsenic GWPS was calculated to be 0.22 mg/L. Therefore, it is recommended that the background GWPS for arsenic in the shallow groundwater system be established at 0.22 mg/L.

A site-specific GWPS of 0.0034 mg/L for cobalt has been established and is detailed in the *2024 UPDATE Winneshiek Hydrologic Monitoring System Plan* (HMSP) (AECOM, 2024), which was approved by the IDNR in their letter dated October 29, 2024 (IDNR, 2024). Previously, the site-specific GWPS was applied to the deep groundwater system in addition to the shallow groundwater system; however, the cobalt prediction limit in the deep groundwater system is below the 567 IAC Chapter 137 Statewide Standard for a Protected Groundwater Source of 0.0021 mg/L. Therefore, it is recommended that the health-based GWPS (i.e., 0.0021 mg/L) be used as the GWPS for the deep groundwater system.

5.2 First Order Regression Calculations

Table 11 of the AWQR lists a projected year to completion for each analyte/well pair in corrective action (i.e., those listed in Table 4 of this memo). Remedy completion timeframes were estimated for the individual analyte/well pairs in corrective action for inclusion in Table 11 of the 2025 AWQR.

For the corrective action constituents that have achieved compliance with the GWPS (i.e., arsenic in MW-33), first order regression calculations were not utilized. The projected year to completion is three years after compliance with the GWPS was first statistically achieved and will remain that date as long as concentrations remain statistically below the GWPS during the interim statistical evaluations.

For corrective constituents that have not achieved compliance with the GWPS, the projected year to completion was based on the first-order regression calculations for each individual analyte/well pair. The projected years to completion are three years after the first order regression calculations projected initial compliance with the GWPS. The first order regression calculations for these corrective action constituents are included in "Sample Values and Corresponding 1st-Order Regression Calculations for Date to Completion" table in Attachment 5.

5.3 SSL Summary

Confidence interval output for the shallow and deep groundwater assessment and corrective action constituents are included in Attachments 4 and 5, respectively. The results of the shallow and deep groundwater evaluations are included in Tables 13 and 14, respectively.

Table 13
Shallow Groundwater SSL Summary
Oct./Nov. 2014 – Oct. 2025 Appendix II Data

Chemical Name	Wells with SSL [1]	SSL Not Identified or Rejected [1]	GWPS [2]
Assessment Monitoring Locations			
Cadmium (mg/L)		MW-4	0.005
Chromium (mg/L)		MW-7A	0.1
Nickel (mg/L)		MW-4, MW-7A, MW-40A, MW-46A	0.1
Corrective Action Monitoring Locations - Assessment Constituents			
Nickel (mg/L)		MW-29A, MW-31A	0.1
Sulfide (mg/L)		MW-29A	3
Delineation and Corrective Action Monitoring Locations – Corrective Action Constituents			
Arsenic (mg/L)		MW-33	0.22
Cobalt (mg/L)	MW-29A, MW-31A, MW-43A		0.0034

[1] Under the assessment null hypothesis, an SSL is indicated when the lower confidence limit exceeds the GWPS. Under corrective action null hypothesis, an SSL remains when the upper confidence limit exceeds the GWPS.

[2] Values are the 40 CFR Part 141 Safe Drinking Water Act MCL, the IAC 567 Chapter 137 Statewide Standard for a Protected Groundwater Source, or background in the case of arsenic, cobalt, and sulfide. Discussion regarding the site-specific background GWPS values for arsenic and cobalt is provided in Section 5.1. Sulfide does not have an MCL or Statewide Standard; therefore, the GWPS is background. Since sulfide has not been detected in the shallow groundwater background data set, background is currently taken as the laboratory reporting limit.

Table 14
Deep Groundwater SSL Summary
Oct./Nov. 2014 – Oct. 2025 Appendix II Data

Chemical Name	Wells with SSL [1]	SSL Not Identified or Rejected [1]	GWPS [2]
Corrective Action Monitoring Locations – Assessment Constituents			
Barium (mg/L)		MW-35	2
Nickel (mg/L)		MW-35	0.1
Corrective Action Monitoring Locations – Corrective Action Constituents			
Cobalt (mg/L)	MW-35		0.0021

[1] Under the assessment null hypothesis, an SSL is indicated when the lower confidence limit exceeds the GWPS. Under corrective action null hypothesis, an SSL remains when the upper confidence limit exceeds the GWPS.
[2] Values are the 40 CFR Part 141 Safe Drinking Water Act MCL or the IAC 567 Chapter 137 Statewide Standard for a Protected Groundwater Source.

5.4 Summary of Comparison to Groundwater Protection Standard

5.4.1 Assessment Monitoring Locations

No SSLs were identified in the shallow and deep groundwater assessment monitoring locations.

5.4.2 Corrective Action Monitoring Locations

No SSLs were identified for the assessment constituents in the shallow and deep groundwater corrective action monitoring locations.

For the shallow groundwater corrective action constituents listed in Table 4, SSLs over the GWPS remained for cobalt in MW-29A and MW-31A. Compliance with the GWPS was newly achieved for arsenic in MW-33 during the current (Fall 2025) statistical evaluation. In accordance with 567 IAC 113.10(9)e(2), arsenic in MW-33A will return to assessment constituents in Fall 2028, as long as concentrations remain below the GWPS during interim statistical evaluations. In addition, since arsenic is the only corrective action constituent at MW-33A, MW-33A will return to assessment monitoring when arsenic returns to an assessment constituent.

For the deep groundwater corrective action constituent listed in Table 4, an SSL continued to be identified for cobalt in MW-35.

5.4.1 Delineation Monitoring Locations

No SSLs were identified for the assessment constituents in the shallow groundwater delineation monitoring locations. Cobalt in MW-43 was evaluated as a corrective action constituent. An SSL continued to be identified for cobalt in MW43; therefore, compliance with the GWPS has not been achieved.

6 Effective Power and Site-Wide False Positive Rate

Statistical power calculations, effective power curves for the 1-of-2 prediction limit plan, and the current site-wide false positive rate (SWFPR) will be evaluated starting in the Spring or Fall 2026 statistical evaluation.

Statistical power calculations for confidence limits compared to the GWPS under assessment monitoring (or assessment mode under corrective action) are included in the confidence interval output of Attachment 4. Details regarding the purpose and procedures for these calculations are provided in Attachment 1. Confidence limits are calculated to meet statistical power levels of 50%

for increases in the true concentration mean of 1.5 times a fixed standard, and 80% for increases in the true concentration mean of 2.0 times a fixed standard, as discussed in *Unified Guidance* (USEPA, 2009) Chapter 22.

7 Conclusions

The methodology described in Attachment 1 was utilized to conduct the statistical evaluations for the surface water, shallow groundwater, and deep groundwater system locations in the detection, assessment, corrective action, and delineation monitoring programs.

7.1 Surface Water Monitoring Locations

A summary of the Fall 2025 statistical results for the surface water system is presented in Table 15.

Table 15
Summary of the Fall 2025 Evaluation – Surface Water

Monitoring Location	Monitoring Program	Current Schedule [1] (Oct. 2025)	Current SSIs	Corrective Action Constituents [2]		Retesting Parameter [3]	Monitoring Program Changes
				Current SSLs	Achieved Compliance with GWPS		
Downstream Monitoring Locations							
SW-2	Detection	Appendix I					
SW-5	Detection	Appendix I					
Upstream Monitoring Locations							
SW-1	Background	Appendix I					

[1] In addition to the Appendix I list, surface water locations were also analyzed for the geochemical parameters as outlined in the *2024 ACM Report* (AECOM, 2025) in Oct. 2025. As indicated in the *Remedial Selection Report* (Foth, 2025), continued monitoring of geochemical parameters at the surface water monitoring locations was not recommended.
[2] Analyte/well pairs with SSLs over the GWPS identified during previous statistical evaluations and have not achieved compliance with the GWPS for 3 consecutive years in accordance with 567 IAC 113.10(9)e(2).
[3] Retest samples will be collected prior to the next semiannual sampling event and will be utilized to determine if any monitoring program changes will be initiated.

7.1.1 Detection Monitoring Locations

In October 2025, semiannual detection monitoring for the Appendix I list was conducted at SW-2 and SW-5. No SSIs were identified at the detection monitoring locations in the surface water system.

Semiannual detection monitoring for cobalt will be conducted at SW-2 and SW-5 in Spring 2026. As indicated in the *Remedial Selection Report* (Foth, 2025), it was recommended that surface water locations be analyzed only for cobalt. The *Remedial Selection Report* (Foth, 2025) was approved by the IDNR in their letter dated January 6, 2026 (IDNR, 2026).

7.1.1 Background Monitoring Locations

Semiannual background monitoring was not conducted at SW-1 in October 2025 due to dry conditions. Therefore, surface water background included the October/November through June 2025 data.

Semiannual background monitoring for cobalt will be conducted at SW-1 in Spring 2026. As indicated in the *Remedial Selection Report* (Foth, 2025), it was recommended that surface water locations be analyzed only for cobalt. The *Remedial Selection Report* (Foth, 2025) was approved by the IDNR in their letter dated January 6, 2026 (IDNR, 2026).

7.2 Shallow Groundwater Monitoring Locations

A summary of the Fall 2025 statistical results for the shallow groundwater system is presented in Table 16.

Table 16
Summary of the Fall 2025 Evaluation – Shallow Groundwater

Monitoring Location	Monitoring Program	Current Schedule [1,2] (Oct. 2025)	Current SSIs	Corrective Action Constituents [3]		Retesting Parameter [4]	Monitoring Program Changes
				Current SSLs	Achieved Compliance with GWPS		
Groundwater Underdrain Monitoring Locations							
GU-1	Detection	Dry					
GU-2	Detection	Dry					
Downgradient Monitoring Locations							
MW-2R	Detection	Appendix I					
MW-3	Detection	Appendix I					
MW-4	Assessment	Appendix II	Cadmium; Nickel				
MW-4B	Detection	Appendix I					
MW-7A	Assessment	Appendix II	Chromium; Nickel				
MW-24A	Assessment	Dry					
MW-25A	Detection	Appendix I					
MW-29A	Corrective Action	Appendix II	Nickel; Sulfide	Cobalt			
MW-31A	Corrective Action	Appendix II	Nickel	Cobalt			
MW-33A	Corrective Action	Appendix II			Arsenic		
MW-34A	Detection	Appendix I					
MW-38A	Detection	Appendix I					
MW-40A	Assessment	Appendix II	Nickel				
MW-41A	Detection	Appendix I					
MW-45A	Detection	Appendix I					
MW-46A	Assessment	Appendix II	Nickel				
MW-101	Detection	Dry					
Delineation Monitoring Locations							
MW-39A	Delineation	Appendix I					
MW-42A	Delineation	Appendix I					
MW-43A	Delineation	Appendix I		Cobalt			
MW-44A	Delineation	Appendix I					

[1] GU-1, GU-2, MW-24, and MW-101 were dry or had insufficient volume for sample collection; therefore, GU-1, GU-2, MW-24, and MW-101 were not included in this Fall 2025 statistical evaluation. Appendix II locations were sampled for the Appendix I and detected Appendix II constituents in Oct. 2025, with the exceptions of MW-7A and MW-46. MW-7A and MW-46A moved to assessment monitoring in Summer 2023 and Fall 2024, respectively; however, MW-7A has only undergone one complete Appendix II sampling event, and MW-46A had yet to be sampled for the full Appendix II list. Therefore, MW-7A and MW-46A were sampled for the full Appendix II list in Oct. 2025.

[2] In Oct. 2025, groundwater monitoring locations sampled were also analyzed for the geochemical parameters as outlined in the 2024 ACM Report (AECOM, 2025). As indicated in the Remedial Selection Report (Foth, 2025), biennial monitoring of geochemical parameters will be conducted at the corrective action, delineation, and background monitoring. The IDNR approved the Remedial Selection Report (Foth, 2025) in their letter dated Jan. 6, 2026 (IDNR, 2026). The next biennial geochemical monitoring event will occur in Fall 2027.

[3] Analyte/well pairs with SSLs over the GWPS identified during previous statistical evaluations and have not achieved compliance with the GWPS for 3 consecutive years in accordance with 567 IAC 113.10(9)e(2).

[4] Retest samples will be collected prior to the next semiannual sampling event and will be utilized to determine if any monitoring program changes will be initiated.

7.2.1 Detection Monitoring Locations

In October 2025, semiannual detection monitoring for the Appendix I constituents was conducted at MW-2R, MW-3, MW-4B, MW-25A, MW-34A, MW-38A, MW-41, and MW-45A. GU-1, GU-2, MW-24, and MW-101 were dry or had insufficient volume for sample collection; therefore, GU-1, GU-2, MW-24, and MW-101 were not included in this Fall 2025 statistical evaluation. No SSIs were identified at the detection monitoring locations that were sampled in the shallow groundwater system in October 2025.

Semiannual detection monitoring for the Appendix I constituents will be conducted at GU-1, GU-2, MW-2R, MW-3, MW-4B, MW-24, MW-25A, MW-34A, MW-38A, MW-41, MW-45A, and MW-101 in Spring 2026 as long as there is sufficient volume for sample collection.

7.2.2 Assessment Monitoring Locations

In October 2025, semiannual assessment monitoring was conducted at MW-4 and MW-40A for the Appendix I and detected Appendix II constituents, and semiannual assessment monitoring was conducted at MW-7A and MW-46A for the full Appendix II list. Assessment monitoring location MW-24A was dry or had insufficient volume for sample collection; therefore, MW-24A was not included in this Fall 2025 statistical evaluation.

The SSIs identified at the shallow groundwater assessment monitoring locations are summarized in Table 16. No SSLs were identified for the shallow groundwater assessment monitoring locations.

As further addressed in Section 4.3.2.1, an evaluation to exit assessment monitoring was not conducted in this Fall 2025 statistical evaluation. Exiting assessment monitoring will be evaluated starting in the Spring 2026 statistical evaluation.

Semiannual assessment monitoring for the Appendix I and detected Appendix II list will be conducted at MW-4A, MW-7A, MW-40A, and MW-46A in Spring 2026. No Appendix II constituents not included in Appendix I were detected above the PQL at MW-7A during the initial full Appendix II sampling events; therefore, no new constituents will be added to the detected Appendix II constituents during semiannual assessment monitoring events. In accordance with 567 IAC 113.10(6)b and Permit Special Provision X.4.b, MW-7A will be sampled for the full Appendix II list again in Fall 2030. MW-46 was sampled for the full Appendix II list for the first time in October 2025, and no Appendix II constituents not in Appendix I were detected above the PQL. Therefore, in accordance with 567 IAC 113.10(6)b, annual monitoring for the full Appendix II list will be conducted at MW-46A again in Fall 2026. For the remaining assessment monitoring locations, at least two sampling events for the full Appendix II list have been completed; therefore, in accordance with Permit Special Provision X.4.b, resampling for the full Appendix II list will be conducted every five years. The Appendix II resampling event schedule will be provided in Table 2 of the AWQR.

7.2.3 Corrective Action Monitoring Locations

In October 2025, semiannual corrective action monitoring was conducted at MW-29A, MW-31A, and MW-33A for the Appendix I and detected Appendix II constituents.

The SSIs identified for the assessment constituents in the shallow groundwater corrective action monitoring locations are summarized in Table 16. No SSLs were identified for the assessment constituents in the shallow groundwater corrective action monitoring locations.

Confidence intervals in corrective action mode were utilized to evaluate the corrective action constituents in the shallow groundwater system listed in Table 4. For arsenic and cobalt, the site-specific background GWPS values discussed in Section 5.1 were utilized. As shown in Table 17, SSLs over the GWPS remained for cobalt in MW-29A and MW-31. Compliance with the GWPS was newly achieved for arsenic in MW-33 during the current (Fall 2025) statistical evaluation. In accordance with 567 IAC 113.10(9)e(2), arsenic in MW-33A will return to assessment constituents in Fall 2028, as long as concentrations remain below the GWPS during interim statistical evaluations. In addition, since arsenic is the only corrective action constituent at MW-33A, MW-33A will return to assessment monitoring when arsenic returns to an assessment constituent.

Semiannual corrective action monitoring for the Appendix I and detected Appendix II constituents will be conducted at MW-29A, MW-31A, and MW-33A in Spring 2026. In accordance with Permit Special Provision X.4.b, resampling for the full Appendix II list at the corrective action monitoring wells will be conducted every five years. The Appendix II resampling event schedule will be provided in Table 2 of the 2025 AWQR.

7.2.4 Delineation Monitoring Locations

In October 2025, semiannual delineation monitoring for the Appendix I constituents was conducted at MW-39A, MW-42A, MW-43A, and MW-44A. While these locations were sampled for the Appendix I list in October 2025, statistical comparisons were only conducted for the constituent the wells are delineating: cobalt.

No SSIs were identified for cobalt at MW-39A, MW-42A, and MW-44A.

Cobalt in MW-43A was evaluated as a corrective action constituent due to a previously identified SSL for this analyte/well pair. An SSL continued to be identified for cobalt in MW43; therefore, compliance with the GWPS has not been achieved.

Semiannual delineation monitoring will continue at MW-39A, MW-42A, MW-43A, and MW-44A in Spring 2026. These wells were previously analyzed for the Appendix I list; however, MW-39A, MW-42A, MW-43A, and MW-44A moved to delineation monitoring this Fall 2025 sampling event as requested in the *Remedial Selection Report* (Foth, 2025) and approved by the IDNR in their letter dated January 6, 2026 (IDNR, 2026). Therefore, beginning in Spring 2026, MW-39A, MW-43A, and MW-44A will only be analyzed for the constituent the wells are delineating: cobalt.

7.2.5 Background Monitoring Locations

Semiannual background monitoring for the Appendix I list and Appendix II constituents detected in the downgradient monitoring wells was conducted at MW-1 and MW-37A in October 2025, and will be conducted again in Spring 2026.

7.3 Deep Groundwater Monitoring Locations

A summary of the Fall 2025 statistical results for the deep groundwater system is presented in Table 17.

Table 17
Summary of the Fall 2025 Evaluation – Deep Groundwater

Monitoring Location	Monitoring Program	Current Schedule [1,2] (Oct. 2025)	Current SSIs	Corrective Action Constituents [2]		Retesting Parameter [3]	Monitoring Program Changes
				Current SSLs	Achieved Compliance with GWPS		
Downgradient Monitoring Locations							
MW-11	Assessment	Dry					
MW-22	Detection	Dry					
MW-35	Corrective Action	Appendix II	Barium; Nickel	Cobalt			
Background Monitoring Locations							
MW-18	Background	Appendix I					
MW-19R	Background	Appendix II					

[1] MW-11 and MW-22 were dry or had insufficient volume for sample collection; therefore, MW-11 and MW-22 were not included in this Fall 2025 statistical evaluation. Appendix II locations were sampled for the Appendix I and detected Appendix II constituents in Oct. 2025.

[2] In Oct. 2025, groundwater monitoring locations sampled were also analyzed for the geochemical parameters as outlined in the *2024 ACM Report* (AECOM, 2025). As indicated in the *Remedial Selection Report* (Foth, 2025), biennial monitoring of geochemical parameters will be conducted at the corrective action, delineation, and background monitoring locations. The IDNR approved the *Remedial Selection Report* (Foth, 2025) in their letter dated Jan. 6, 2026 (IDNR, 2026). The next biennial geochemical monitoring event will occur in Fall 2027.

[3] Analyte/well pairs with SSLs over the GWPS identified during previous statistical evaluations and have not achieved compliance with the GWPS for 3 consecutive years in accordance with 567 IAC 113.10(9)e(2).

[4] Retest samples will be collected prior to the next semiannual sampling event and will be utilized to determine if any monitoring program changes will be initiated

7.3.1 Detection Monitoring Locations

Detection monitoring well MW-22 was not sampled in October 2025 as described in Table 17.

Semiannual detection monitoring for the Appendix I constituents will be conducted at MW-22 in Spring 2026 as long as there is sufficient volume for sample collection.

7.3.2 Assessment Monitoring

Assessment monitoring well MW-11 was not sampled in October 2025 as described in Table 17.

Semiannual detection monitoring for the Appendix I and detected II constituents will be conducted at MW-11 in Spring 2026 as long as there is sufficient volume for sample collection. In accordance with Permit Special Provision X.4.b, resampling for the full Appendix II list at MW-11 will be conducted every five years. The Appendix II resampling event schedule will be provided in Table 2 of the 2025 AWQR.

7.3.3 Corrective Action Monitoring

In October 2025, semiannual corrective action monitoring for Appendix I and detected Appendix II constituents was conducted at MW-35.

The SSIs identified for the assessment constituents in MW-35 are summarized in Table 17. No SSLs were identified for the assessment constituents in MW-35.

A confidence interval in corrective action mode was utilized to evaluate the deep groundwater corrective action constituent listed in Table 4. As shown in Table 18, an SSL over the GWPS remained for cobalt in MW-35.

Semiannual corrective action monitoring for the Appendix I and detected Appendix II constituents will be conducted at MW-35 in Spring 2026. In accordance with Permit Special Provision X.4.b, resampling for the full Appendix II list at the corrective action monitoring wells will be conducted every five years. The Appendix II resampling event schedule will be provided in Table 2 of the 2025 AWQR.

7.3.4 Background Monitoring

Semiannual background monitoring for the Appendix I and Appendix II constituents detected in the downgradient monitoring wells was conducted at MW-18 and MW-19R in October 2025, and will be conducted again in Spring 2026.

Attachment 1

Detailed Discussion of Statistical Methods

Foth

Memorandum

Statistical Methodology

1. Comparison to Background

For determining which parameters will need a formal statistical treatment, the Unified Guidance (USEPA, 2009) suggests splitting monitoring parameters into three distinct groups: a) reliable indicators selected for formal testing; b) other analytes which are monitored for general groundwater quality information but not statistically tested; and c) those meeting the "never-detected" criteria. Only those parameters with some historically detected presence in background need to be included in the first group and treated with a formal statistical test. Any parameter that has never been detected in background is eligible for the third group of "never-detected" constituents. Constituents with detections below the reporting limit (J-flagged data) will be considered "never-detected." As a means of evaluating the third group, the Unified Guidance suggests the Double Quantification Rule (DQR). The DQR is stated in the Unified Guidance as:

"A confirmed exceedance is registered if any well-constituent pair in the '100% non-detect' group exhibits quantified measurements [i.e., at or above the reporting limit (RL)] in two consecutive sample and resample events."

The Unified Guidance also recommends establishing background sample sizes as large as feasible. The guidance recognizes that small sample sizes in background can be "particularly" troublesome, especially in controlling statistical test false positive and negative rates. With parametric tests (such as parametric prediction limits), the false positive rate may be controlled, but at the expense of statistical power. With non-parametric tests (such as non-parametric prediction limits or the "quasi-statistical" DQR), the false positive rate may be unacceptably high. The Unified Guidance suggests that generally at least 8 to 10 separate background measurements be available, recognizing that statistical power continues to increase with larger sample sizes.

The statistical analysis methods utilized for comparison to background were the DQR and "1-of-2" intrawell and interwell prediction limits as recommended in the Unified Guidance (USEPA, 2009).

Background Data Set

Surface Water
The interwell surface water background data set comprises the upgradient surface-water monitoring point SW-1, from October/November 2014, when low-flow sampling began, through the most recent monitoring result with the adjustment addressed in Section 3.2 and 3.3.

Shallow Groundwater
The interwell shallow background data set comprises MW-1 and MW-37A from October/November 2014, when low-flow sampling began, through the most recent monitoring results with the adjustments addressed in Sections 3.2 and 3.3.

Deep Groundwater

The interwell deep background data set comprises MW-18 and MW-19R from October/November 2014, when low-flow sampling began, through the most recent monitoring results with the adjustments addressed in Section 3.2 and 3.3.

Double Quantification Rule

The DQR will be used to evaluate SSIs over background for the Appendix I and II constituents that were not detected above the reporting limit in the background data sets. An SSI will be indicated for any well-constituent pair with quantified measurements at or above the reporting limit noted for two consecutive sample and resample events. If applicable, the resample will be collected prior to next semiannual sampling event.

Interwell Prediction Limits

Interwell prediction limits will be used to statistically evaluate SSIs over background for the Appendix I and II constituents which have been detected above the reporting limit in the background data set. A "1-of-2" retesting plan will be utilized on individual sample results. The 1-of-2 retesting plan as defined in the Unified Guidance concludes that an SSI has occurred when two out of two sample results exceed the prediction limit, while no SSI is concluded if 1-of-2 are below the limit. If applicable, the resample will be collected prior to next semiannual sampling event. The prediction limit for each constituent will be recalculated semiannually.

For interwell constituents with less than or equal to 50% detects in the background data set, a non-parametric prediction limit will be utilized. The non-parametric prediction limit will be taken as the maximum order statistic (maximum value) of the background data.

For interwell constituents with greater than 50% detects in the background data set, normality assumptions will be verified using the Shapiro-Wilk normality test. If the background data is not normally distributed, a non-parametric prediction limit will be utilized (as described in the paragraph above). If the background data is normally distributed or can be fit to a normal distribution utilizing a normalizing transformation, then a normal-based parametric prediction limit will be applied.

When considering a lognormal prediction limit, a comparison will be made to the maximum order statistic for the background data set. Lognormal prediction limits can be sensitive to smaller departures from lognormality. That is, if data are not truly lognormal, but also not rejected as lognormal, the prediction limit may be inflated because of the transformation. In choosing a lognormal limit, in addition to the percent detections and lognormal goodness of fit criteria, an additional convention will be applied. If the lognormal limit exceeds the level of twice the maximum background concentration, it is assumed that the lognormal model does not adequately fit the background distribution and a non-parametric prediction limit will be selected.

For interwell constituents with 50% to 85% detects in the background data set, Kaplan-Meier estimation will be applied to manage statistical bias introduced by non-detects. For interwell constituents with over 85% detects in the background data set, half the reporting limit will be used for non-detect data. These estimation methods follow Unified Guidance recommendations and are given in detail in Unified Guidance Chapter 15 (USEPA, 2009).

The parametric prediction limit will be calculated as:

$$PL = \bar{x} + k \cdot s$$

where $\bar{x}$ is the sample mean of the October/November 2014 through current event background data, *s* is the sample standard deviation, and *k* is the multiplier obtained from the Unified Guidance Table 19-1 (USEPA, 2009) for 1-of-2 interwell prediction limits on observations. In determining *k*, the number of constituents of concern (COCs) for formal statistical evaluation along with the number of downgradient wells need to be identified. Per the basic subdivision discussion presented in Section 19.2.1 of the Unified Guidance, along with the discussion regarding the use of the appendix tables for parametric retesting plans given on pages 19-13 through 19-15 of the Unified Guidance (USEPA, 2009), the *k*-multiplier is chosen based on the number of constituents, wells, and evaluations performed annually. When an exact well and COC configuration is not given in the appendix tables, the *k*-multiplier is linearly interpolated as described on page 19-14 of the Unified Guidance (USEPA, 2009).

Sanitas® v10.1. software (Sanitas Technologies) will be used to check distributional assumptions, perform Kaplan-Meier in the case of 50% to 85% detects in the background data set, and calculate the *k*-multipliers and subsequent prediction limits.

Intrawell Prediction Limits

Intrawell prediction limits are calculated in a similar manner to that described above for the interwell case. A main difference between the two methods is the intrawell limit is calculated from a collection of background measurements within the compliance well. A minimum of eight compliance well background samples will be used when calculating the limit.

A second difference is for the parametric prediction limit, in which the *k*-multiplier is modified from the interwell case, as given in Appendix D Tables 19-10 through 19-18 of the Unified Guidance (USEPA, 2009).

Updating intrawell background is performed periodically. The Unified Guidance (Section 5.3.2) recommends that 4 to 8 new compliance observations be collected prior to updating the background data set. The guidance also states that "a potential update is predicated on there being no statistically significant increase [SSI] recorded for that well constituent, including since the last update." A two-sample t-test or Wilcoxon rank-sum test between existing intrawell background data and the potential set of newer background data is performed, and a non-significant result (α = 0.05) implies that the newer compliance data can be re-classified as background measurements.

For Wilcoxon rank-sum tests, non-detect results cannot be ranked with certainty and the problem is compounded with multiple PQLs and/or J-flagged values (USEPA, 2009). In comparisons where a substantial fraction of non-detect and/or J-flagged measurements or changing PQLs occur, professional judgment will be utilized for evaluating significant differences between the existing intrawell background data and the potential newer set of background data. Consideration will be given to whether significant differences are due to artificial variation introduced by censored data.

2. Comparison to Groundwater Protection Standard – Assessment Monitoring

According to 567 IAC 113.10(6)f and g, under the assessment monitoring program Appendix II results which have been determined to be statistically above background are also statistically compared to the GWPS. If "Appendix II constituents are detected at statistically significant levels above the GWPS" a notice is placed in the operating record and characterization is begun.

Under 567 IAC 113.10(6)h, the GWPS is the maximum contaminant level (MCL) promulgated under Section 1412 of the Safe Drinking Water Act in 40 Code of Federal Regulations (CFR) Part 141. If no MCL exists, or if background concentrations are higher than the MCL, the GWPS is defined as background. Also, per 567 IAC 113.10(6)i, an alternative GWPS may be established by the department for constituents for which there is no MCL such as the "health-based concentrations that comply with the statewide standards for groundwater established pursuant to 567 IAC Chapter 137."

When the GWPS is background concentrations, the statistical methods discussed in the above "1. Comparison to Background" are used. When the GWPS is the MCL or an alternative health-based concentration, per the Unified Guidance (USEPA, 2009), "confidence intervals are the recommended general statistical strategy in compliance/assessment or corrective action monitoring." In the case of normally distributed data, a normal-based parametric confidence interval is used. If the data are not normally distributed a non-parametric confidence interval on the median is used. A lower 99% confidence limit falling above the GWPS implies that concentrations are detected at statistically significant levels above the GWPS with an α-level of 0.01, which is the minimum RCRA regulatory limit from §264.97(i)(2) for an individual test false positive error rate.

The Unified Guidance recognizes that statistical power is also of prime concern to USEPA and that there "should be a high probability that the statistical test will positively identify concentrations that have exceeded a fixed regulatory standard." In compliance/assessment monitoring, instead of pre-specifying the false positive rate prior to computing confidence interval limits, the Unified Guidance suggests the desired level of power (1-β) should be set as an initial target.

For compliance/assessment monitoring purposes, the Unified Guidance (Chapter 22) suggests evaluating increases in the true concentration mean of 1.5 and 2.0 times a fixed standard. (This is similar in concept to the critical power targets in detection monitoring, i.e., 55-60% power at 3σ above background and 80-85% power at 4σ over background). As a general guide, the Unified Guidance suggests there should be at least 70-80% statistical power for detecting increases of 2 times a fixed standard. Specifically, the Unified Guidance recommends there be 50% power of detecting increases in the true concentration mean of 1.5 times a fixed standard (risk ratio of 1.5) and 80% power of detecting increases in the true concentration mean of 2.0 times a fixed standard (risk ratio of 2.0).

To meet these levels of statistical power, α is chosen based on either Unified Guidance Equation 22.1:

$$1 - \beta = G_{T,n-1}\left(t_{1-\alpha,n-1}\middle|\Delta - \sqrt{n}(R-1)\right);$$

where R is the desired risk ratio, $t_{(1-\alpha,n-1)}$ is the (1−α) Student's t-quantile with (n−1) degrees of freedom and G represents the cumulative non-central t-distribution with (n−1) degrees of freedom and noncentrality parameter Δ;

or Unified Guidance Equation 22.2:

$$\alpha \sim 1 - F_{T,n-1}\left(\frac{(R-1)\sqrt{n}}{R \cdot \widehat{CV}} - t_{1-\beta,n-1}\right);$$

where R is the desired risk ratio, n is the sample size, CV is the estimated sample coefficient of variation, $t_{(1-\beta,n-1)}$ is the (1−β) Student's t-quantile with (n−1) degrees of freedom, and F is the cumulative (central) Student's t-distribution function.

The first equation (Unified Guidance Equation 22.1) assumes a coefficient of variation (CV) =1. This version is used if only poorer estimates of the true CV are available. In practice, a convention has been adopted with the statistical updates to utilize Unified Guidance Equation 22.2 in all cases where a parametric confidence interval is calculated and use Unified Guidance Equation 22.1 when non-parametric confidence intervals are calculated. Since a non-parametric confidence interval is based on the median, it is not as sensitive to departures from normality, and the assumption of a CV=1 in Unified Guidance Equation 22.1 should provide a conservative estimate.

Since 0.01 is the minimum RCRA regulatory limit for α, it is never set lower than this. Conversely, the Unified Guidance recognizes the "difficulty of simultaneously attaining the recommended level of power while controlling the false positive rate, especially for small sample sizes and highly variable data." The Unified Guidance suggests a maximum false positive rate of α=0.2 is a reasonable upper bound.

Finally, like the need for defining a SWFPR under detection monitoring, the Unified Guidance (Chapter 7) recognizes there may be concern about the "use of relatively high individual test-wise false positive rates (α) in order to meet a pre-specified power, especially when considering the cumulative false positive error rate across multiple wells and/or constituents." However, "the Unified Guidance considers computation of cumulative SWFPRs in compliance/ assessment testing to be problematic, and reliance on individual test false positive rates preferable." Notwithstanding, if several confidence limit calculations are compared to the GWPS with high α-levels, caution should be taken in the interpretation.

For calculation of confidence intervals, Sanitas® v10.1 software is again used to check distributional assumptions, perform Kaplan-Meier estimation in the case of 50% to 85% detects, and calculate either parametric or nonparametric confidence limits.

3. Comparison to Groundwater Protection Standard – Corrective Action Monitoring

As stated above, if "Appendix II constituents are detected at statistically significant levels above the GWPS" a notice is placed in the operating record and characterization is begun. Owners or operators are required to initiate an assessment of corrective measures, select a remedy, and implement a remedy in accordance with 567 IAC 113.10(7), (8), and (9). For remedy completion in accordance with 567 IAC 113.10(9)e(2), compliance with the GWPS is considered achieved by demonstrating that concentrations of Appendix II constituents have not exceeded the GWPS

for a period of three consecutive years or an alternate length of time established by the Department.

Individual analyte/well pairs may return to assessment constituents (at the corrective action monitoring location) once compliance with the GWPS has been achieved for a period of 3 years. Note that monitoring wells will not move out of the corrective action monitoring program until all Appendix II constituents have achieved compliance with the GWPS for a period of three consecutive years.

Confidence Intervals in Corrective Action Mode

In the case of the GWPS being a fixed standard as either the 40 CFR Part 141 Safe Drinking Water Act MCL or the 567 IAC Chapter 137 Statewide Standard for a Protected Groundwater Source, "confidence intervals are the recommended general statistical strategy in compliance/assessment or corrective action monitoring" (USEPA, 2009). However, a primary difference between confidence intervals as used under assessment monitoring and confidence intervals used under corrective action is reversal of the null hypothesis. As detailed in Section 7.2 of the Unified Guidance (USEPA, 2009), the hypothesis testing structure under assessment monitoring is to presume compliance point concentrations do not to exceed the fixed standard unless sampling data indicates otherwise. As a formal statistical hypothesis, this is written as:

$$H_0: \Theta \leq G \quad \text{vs.} \quad H_A: \Theta > G$$

In corrective action mode, the hypothesis is reversed. Namely, compliance point concentrations are presumed to exceed the fixed standard and evidence must be presented to demonstrate regulatory compliance. In the case of corrective action, the statistical hypothesis is written as:

$$H_0: \Theta > G \quad \text{vs.} \quad H_A: \Theta \leq G$$

For testing under assessment monitoring, a lower confidence limit (LCL) is compared to the compliance standard *G*. If the LCL is larger than the standard *G*, it is concluded that the compliance standard has been violated.

However, under corrective action monitoring, the upper confidence limit (UCL) is compared to the compliance standard G. In this case, the UCL should lie below the standard to accept the alternative hypothesis that concentration levels are in compliance.

The UCL α-level under corrective action monitoring is set so that a high degree of confidence is achieved in declaring successful remediation. Per the Unified Guidance (Section 7.4.2) "USEPA's overriding concern in corrective action is that remediation efforts are not declared successful without sufficient statistical proof." The Unified Guidance "recommends the use of a reasonably low, fixed test-wide false positive rate (e.g., α = 0.05 or 0.10)." In this case, α = 0.10 corresponds to a 90% UCL.

GWPS as Background

Pursuant to 567 IAC 113.10(6)h, when background concentrations of an analyte exceed the applicable MCL or 567 IAC Statewide Standard for a Protected Groundwater Source, the GWPS is the background concentration. In this case, the GWPS is not a fixed standard but based on a distribution of background sample results.

Section 7.5 of the Unified Guidance (USEPA, 2009) details statistical hypothesis testing under corrective action when the GWPS is background. The Unified Guidance offers two alternative statistical approaches to hypothesis testing in this case. These alternatives are as follows:

A. The first represents a *two-sample* test of two distinct populations, namely the compliance well to background populations. Similar to the statistical tests used under detection and assessment monitoring, with this alternative under corrective action, the Unified Guidance states that "one highly recommended statistical test approach is a prediction limit." The Unified Guidance also states, "whatever the critical value for a selected background test, it becomes the GWPS under compliance/assessment or corrective action monitoring." Further, "the only allowable hypothesis test structure for the two-sample approach follows that of detection and compliance monitoring. Once exceeded and in corrective action, a return to compliance is through evidence that future samples lie below the GWPS using the same hypothesis structure." Therefore, with this approach in corrective action, prediction limits are calculated similarly as in assessment monitoring. Compliance well concentrations below a prediction limit indicate a return to concentrations below the background GWPS.

B. The second involves computation of a fixed statistic from the background data as the GWPS. The Unified Guidance recommendation in this case is to define a fixed GWPS based on a background upper tolerance limit with 95% confidence and 95% coverage. This is designed to be a "reasonable maximum on the likely range of background concentrations." This upper tolerance limit based on background data is then used as a fixed standard in statistical comparisons with 90% or 95% UCLs from compliance wells as discussed previously. Also, with the UCL method, the null hypothesis is reversed from that of assessment monitoring, assuming contamination is above the GWPS. A UCL falling below the background GWPS offers evidence of a return to concentrations below the GWPS. The Unified Guidance refers to this approach as a *single-sample* testing method, since the compliance well population is tested against a defined fixed standard.

The Unified Guidance discusses tradeoffs between the two approaches and does not necessarily prescribe either approach over the other. The Unified Guidance suggests that both approaches may be used, where "the background GWPS would be a range based on the two testing methods rather than a single value."

Normality

For calculation of confidence intervals, Sanitas® v10.1 software is again used to check distributional assumptions, perform Kaplan-Meier estimation in the case of 50% to 85% detects, and calculate either parametric or nonparametric confidence limits. "Corrective Action Mode" is selected for this analysis.

Non-Corrective Action Constituents

As recommended in the Unified Guidance (USEPA, 2009), confidence intervals in corrective action mode will be utilized to evaluate only constituents and monitoring locations with previously identified SSLs over the GWPS. Other compliance constituents (i.e., those without SSLs over the GWPS during prior statistical evaluations) will continue to be evaluated using the "1. Comparison to Background" and "2. Comparison to Groundwater Protection Standard – Assessment Monitoring" methods described above.

Note: The Unified Guidance (USEPA, 2009) states: "it should be recognized that once corrective action or remediation activities are initiated, there will be a considerable time during which the GWPS may still be exceeded. As provided in the RCRA regulations, it is at the conclusion of remediation activities that formal corrective action monitoring evaluation is appropriate. However, in the intervening period of remedial activity, well constituents can still be monitored, and the relative efficacy of remediation measures tracked. The same corrective action hypothesis can be assumed for the targeted constituents; techniques such as trend testing may be appropriate interim applications." Given the statement above and the intentions of 567 IAC 113.10(6)g, as soon as an SSL is identified for an assessment monitoring constituent/location, then the next statistical evaluation will utilize corrective action monitoring (confidence intervals in corrective action mode).

Data Concentration Shifts During Corrective Action

Confidence intervals assume that the population is stable over time. As a result, confidence intervals may not accurately represent the current well concentrations if increasing or decreasing trends are observed (i.e., during a release or under active remediation). Per the Unified Guidance (USEPA, 2009), lower or upper confidence limits constructed on accumulated data may be overly wide (due to high sample variability caused by combining pre- and post-shift data) and may not be reflective of more recent upward/downward shifts in the contaminant distribution.

Alternative procedures may be applied to data sets with shifting distributions. For example, where trends tests are significant, pre-shift data may be removed from the well/parameter data set for the purposes of constructing the confidence interval. "The reduction in sample size will often be more than offset by the gain in statistical power. More recent measurements may exhibit less variation around the shifted mean value, resulting in a shorter confidence interval" (USEPA, 2009).

Another alternative is to construct confidence bands around the trend line to track progress towards exceeding or meeting a fixed standard. As suggested in the Unified Guidance (Chapter 22), if a trend is present, a 90% confidence band (upper 95% confidence limit) is placed on the linear trend line. If the upper 95% confidence limit on the trend line falls below the GWPS, the well is found to have reduced to levels statistically below the GWPS.

As the discussed in the Unified Guidance, "inferences concerning a linear regression are generally appropriate when two conditions hold: 1) the residuals from the regression are approximately normal or at least reasonably symmetric in distribution; and 2) a plot of residuals versus concentrations indicates a scatter cloud of essentially uniform vertical thickness or width." These conditions are assessed through normal probability plots of the regression residuals and plots of residuals against the predicted concentrations.

Data Adjustments Due to Exiting Corrective Action

When analyte/well pairs exit corrective action and return to assessment constituents, the hypothesis testing structure is reversed again. In corrective action mode, compliance point concentrations were presumed to exceed the GWPS, and evidence must be presented to demonstrated regulatory compliance (i.e., UCLs below the GWPS for three consecutive years). With the return to assessment constituents, analyte/well pairs have demonstrated regulatory compliance. The hypothesis testing structure reverts to the assessment monitoring structure where compliance point concentrations are presumed to not exceed the GWPS unless sampling

data indicates otherwise (i.e., LCL is above the GWPS). With this reversion in hypothesis, the focus shifts to evaluating concentration changes in the analyte/well pair that would indicate an increase over the GWPS and re-trigger corrective action. For constituents with historical SSLs, earlier concentrations that had previously triggered corrective action are no longer providing useful information regarding the current assessment monitoring hypothesis. Retaining the historical data during the timeframe in which the GWPS was exceeded will result in the regression or confidence interval methods being slower to respond to new increases. As a result, the historical data prior to when statistical compliance with the GWPS was first achieved will be removed when analyte/well pairs exit corrective action and return to assessment constituents.

[1] Interwell prediction limit data consists of the detected Appendix I parameters in SW-1. Note that background data set adjustments were incorporated in accordance with Sections 3.2 and 3.3 of the Fall 2025 Statistical Evaluation memo.

Sanitas™ v.10.1.03a Software licensed to The Foth Companies, LLC. UG
Hollow symbols indicate censored values.

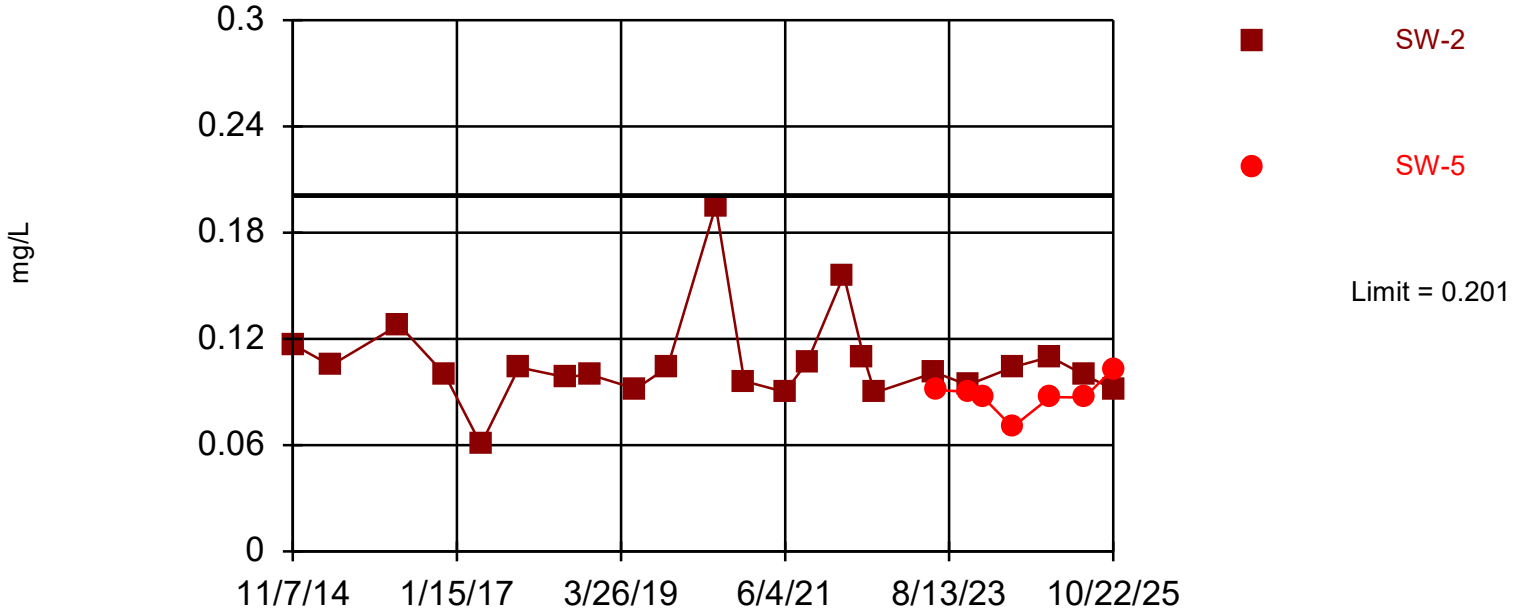
Within Limit

Prediction Limit

Interwell Non-parametric

Non-parametric test used in lieu of parametric prediction limit because censored data exceeded 50%. Limit is highest of 20 background values. 80% NDs. Annual per-constituent alpha = 0.1302. Individual comparison alpha = 0.003316 (1 of 2).

Constituent: Arsenic Analysis Run 12/19/2025 10:02 AM



Winneshiek County SLF Client: Foth Data: Winneshiek Surface Water - Fall 2025 Evaluation

Sanitas™ v.10.1.03a Software licensed to The Foth Companies, LLC. UG

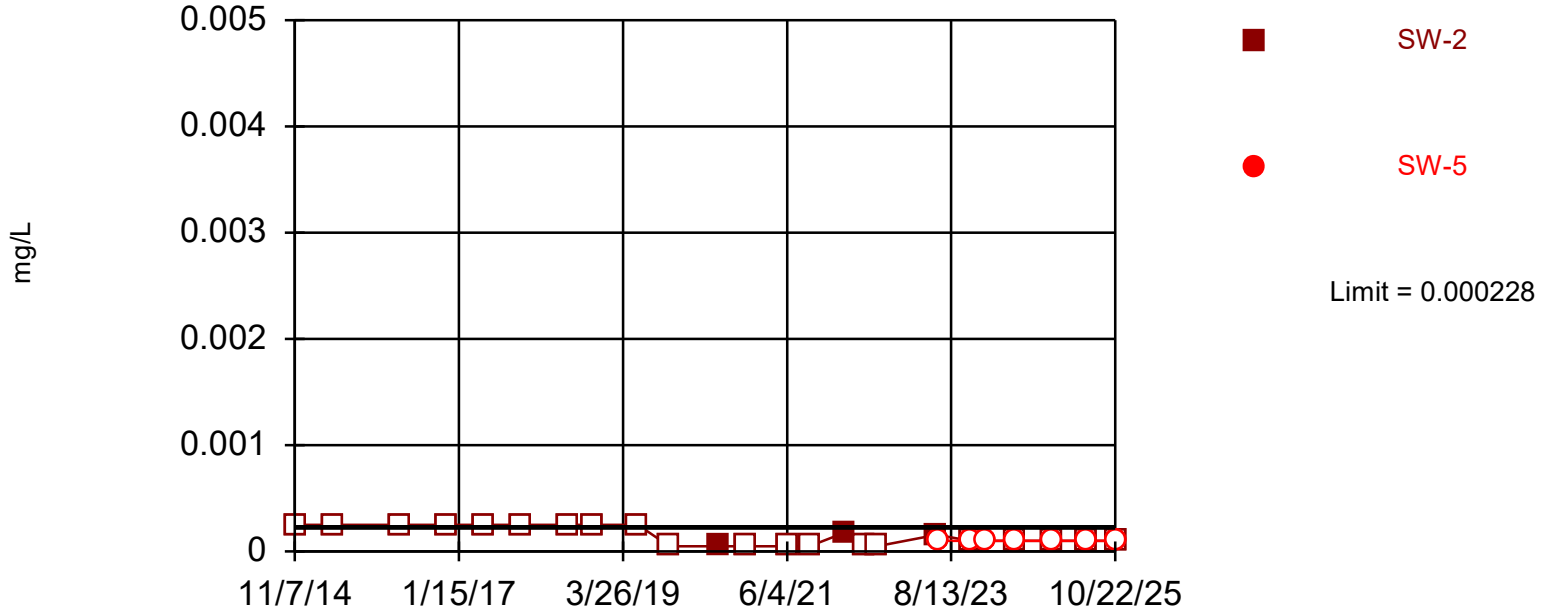
Within Limit

Prediction Limit

Interwell Non-parametric

Non-parametric test used in lieu of parametric prediction limit because the Shapiro Wilk normality test showed the data to be non-normal at the 0.01 alpha level. Limit is highest of 20 background values. Annual per-constituent alpha = 0.1302. Individual comparison alpha = 0.003316 (1 of 2).

Constituent: Barium Analysis Run 12/19/2025 10:02 AM



Winneshiek County SLF Client: Foth Data: Winneshiek Surface Water - Fall 2025 Evaluation

Sanitas™ v.10.1.03a Software licensed to The Foth Companies, LLC. UG
Hollow symbols indicate censored values.

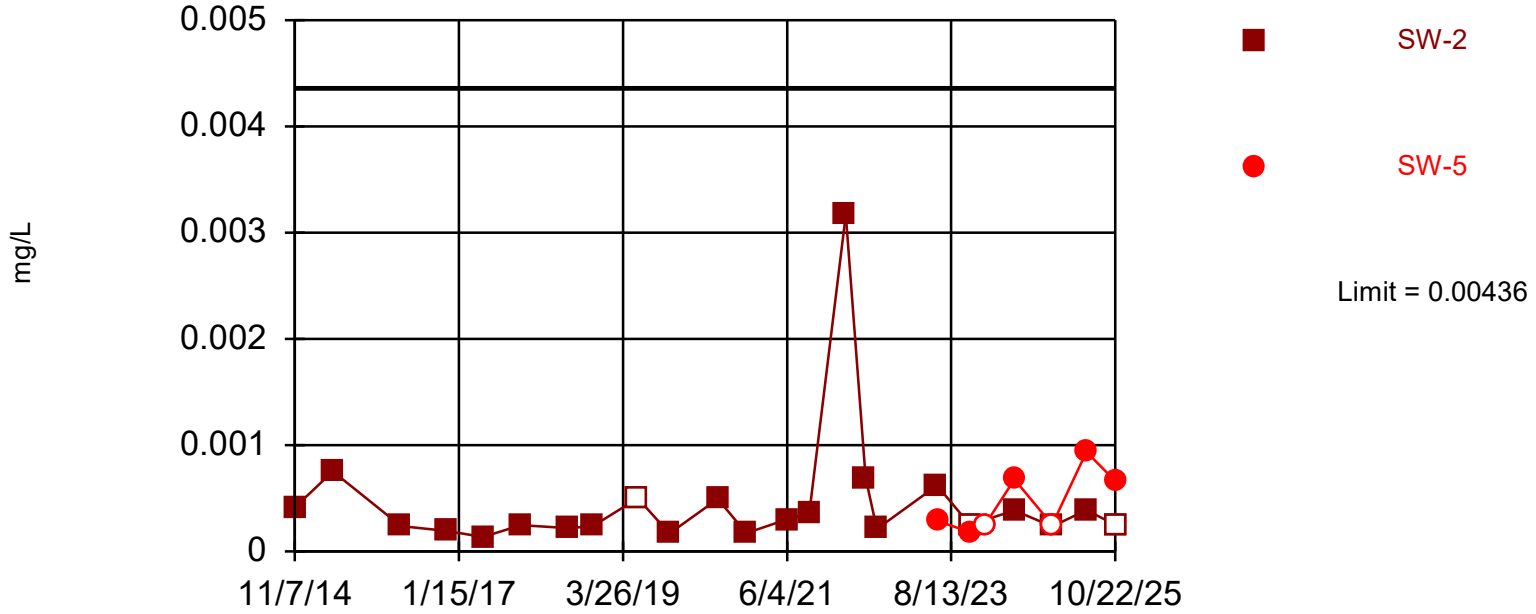
Within Limit

Prediction Limit

Interwell Non-parametric

Non-parametric test used in lieu of parametric prediction limit because censored data exceeded 50%. Limit is highest of 12 background values. 75% NDs. Annual per-constituent alpha = 0.2471. Individual comparison alpha = 0.006734 (1 of 2).

Constituent: Cadmium Analysis Run 12/19/2025 10:02 AM



Winneshiek County SLF Client: Foth Data: Winneshiek Surface Water - Fall 2025 Evaluation

Sanitas™ v.10.1.03a Software licensed to The Foth Companies, LLC. UG
Hollow symbols indicate censored values.

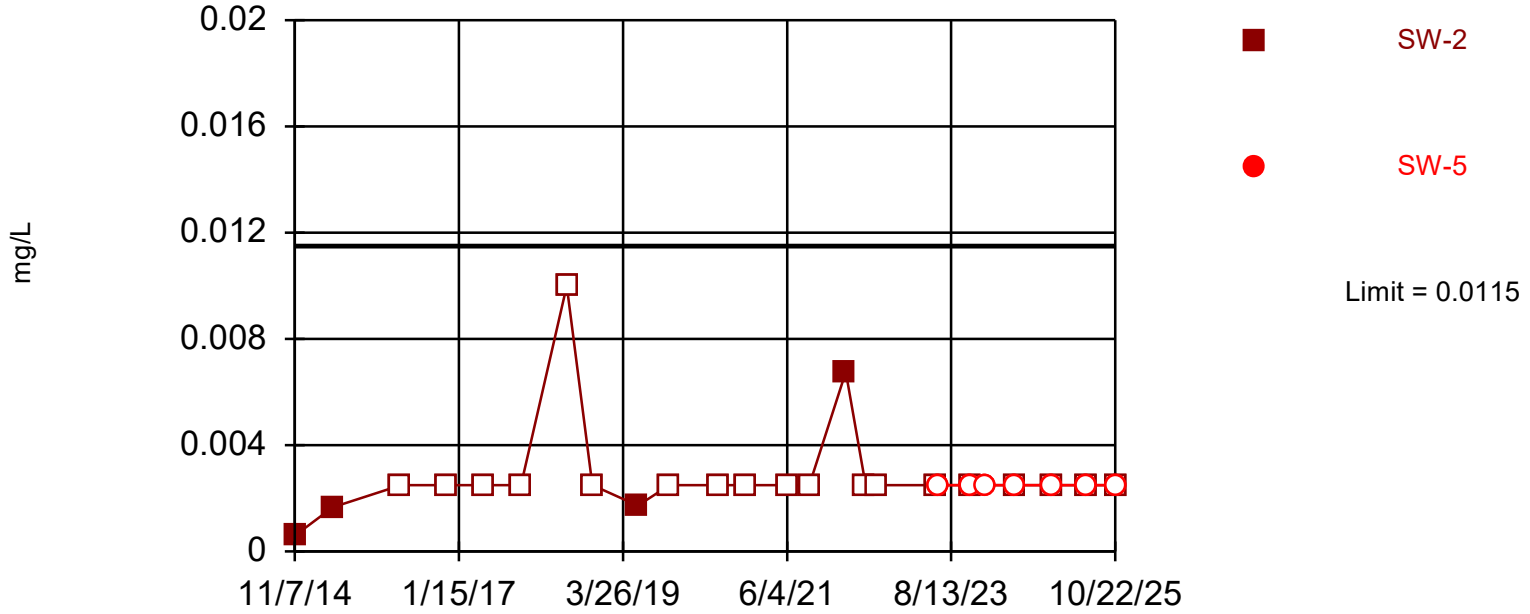
Within Limit

Prediction Limit

Interwell Non-parametric

Non-parametric test used in lieu of parametric prediction limit because the Shapiro Wilk normality test showed the data to be non-normal at the 0.01 alpha level. Limit is highest of 20 background values. 25% NDs. Annual per-constituent alpha = 0.1302. Individual comparison alpha = 0.003316 (1 of 2).

Constituent: Cobalt Analysis Run 12/19/2025 10:02 AM



Winneshiek County SLF Client: Foth Data: Winneshiek Surface Water - Fall 2025 Evaluation

Sanitas™ v.10.1.03a Software licensed to The Foth Companies, LLC. UG
Hollow symbols indicate censored values.

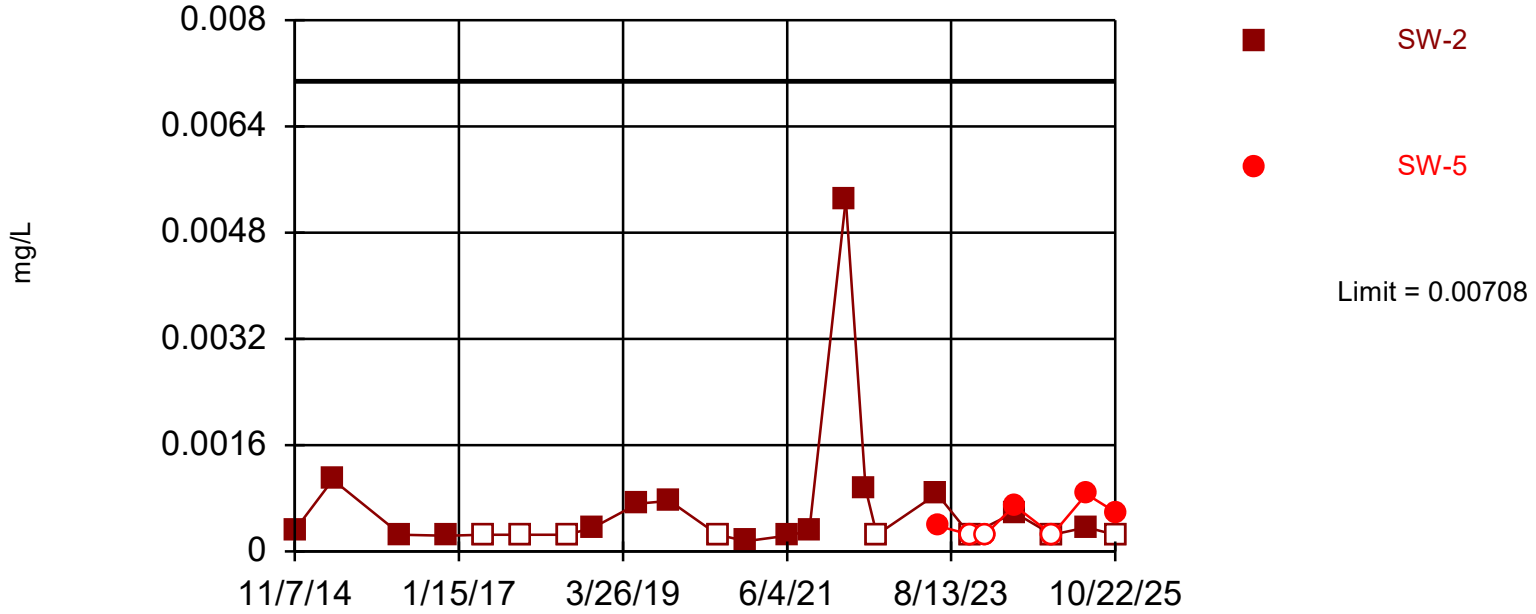
Within Limit

Prediction Limit

Interwell Non-parametric

Non-parametric test used in lieu of parametric prediction limit because censored data exceeded 50%. Limit is highest of 20 background values. 70% NDs. Annual per-constituent alpha = 0.1302. Individual comparison alpha = 0.003316 (1 of 2).

Constituent: Copper Analysis Run 12/19/2025 10:02 AM



Winneshiek County SLF Client: Foth Data: Winneshiek Surface Water - Fall 2025 Evaluation

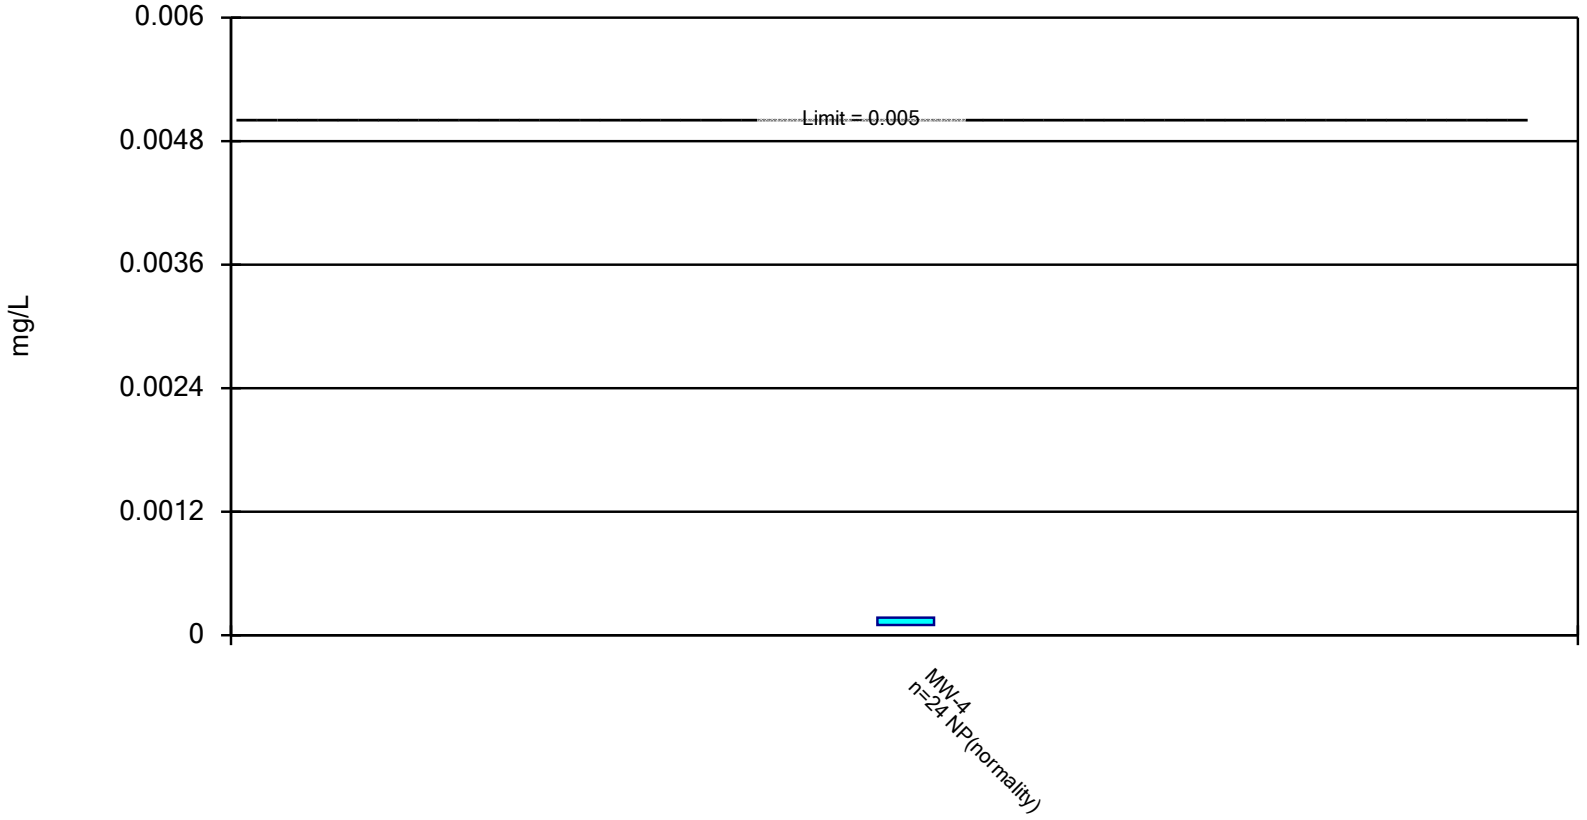
[1] Under assessment mode, an SSL is indicated when the lower confidence limit exceeds the groundwater protection standard (compliance limit).

[2] Value is the 40 CFR Part 141 Safe Drinking Water Act MCL, the IAC 567 Chapter 137 Statewide Standard for a Protected Groundwater Source, or background. Sulfide does not have an MCL or Statewide Standard; therefore, the GWPS is background. Since sulfide has not been detected in the shallow groundwater background dataset, background is currently taken as the laboratory reporting limit.

[3] For parametric confidence intervals: Except where otherwise indicated, based on Unified Guidance Equation 22.2, i.e.,

$$\alpha \sim 1 - F_{T,n-1}\left(\frac{(R-1)\sqrt{n}}{R \cdot \widehat{CV}} - t_{1-\beta,n-1}\right)$$



where R is the desired risk ratio, n is the sample size, CV is the estimated sample coefficient of variation, $t_{1-b,n-1}$ is the (1−b) Student's t-quantile with (n−1) degrees of freedom, and F is the cumulative (central) Student's t-distribution function.

[4] For non-parametric confidence intervals: Based on Unified Guidance Equation 22.1, i.e., $1-\beta = G_{T,n-1}\left(t_{1-\alpha,n-1}\middle|\Delta = \sqrt{n}(R-1)\right)$

where R is the desired risk ratio, $t_{1-a,n-1}$ is the (1−a) Student's t-quantile with (n−1) degrees of freedom and G represents the cumulative non-central t-distribution with (n−1) degrees of freedom and noncentrality parameter D.

Non-Parametric Confidence Interval - Assessment Monitoring

Compliance Limit is not exceeded. Per-well alpha = 0.01.

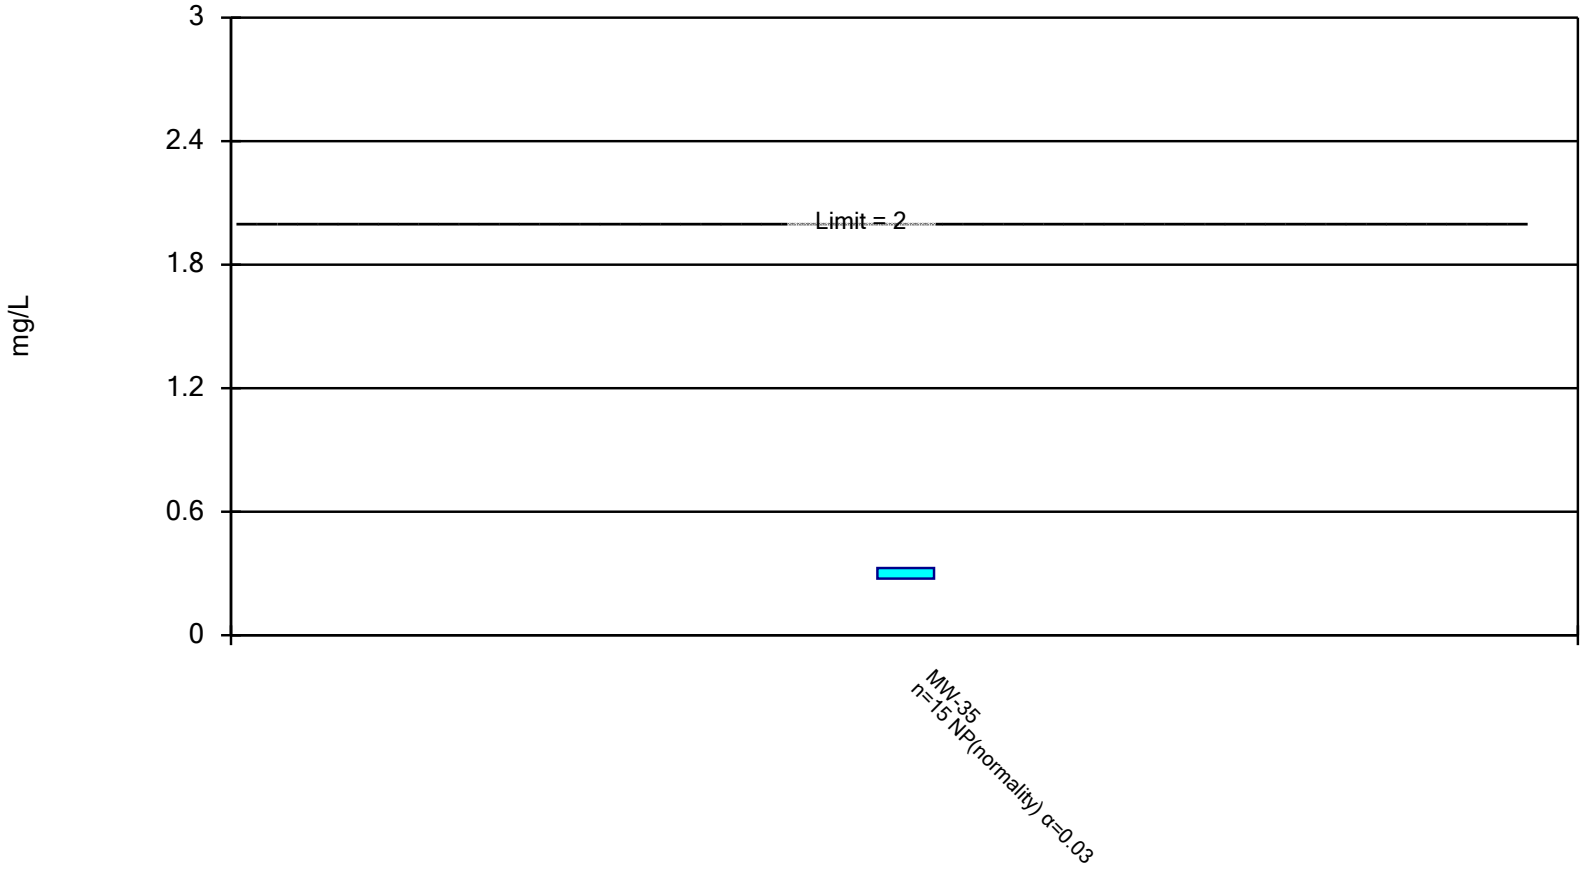
where R is the desired risk ratio, n is the sample size, CV is the estimated sample coefficient of variation, $t_{1-b,n-1}$ is the (1−b) Student's t-quantile with (n−1) degrees of freedom, and F is the cumulative (central) Student's t-distribution function.



[4] For non-parametric confidence intervals: Based on Unified Guidance Equation 22.1, i.e., $1 - \beta = G_{T,n-1}\left(t_{1-\alpha,n-1} \middle| \Delta = \sqrt{n}(R-1)\right)$

where R is the desired risk ratio, $t_{1-a,n-1}$ is the (1−a) Student's t-quantile with (n−1) degrees of freedom and G represents the cumulative non-central t-distribution with (n−1) degrees of freedom and noncentrality parameter D.

Sanitas Report Output for Confidence Interval Calculations

Corrective Action Mode

Shallow Groundwater Arsenic

GWPS as Background - One-Sample Confidence Interval Testing Method

Calculation of Arsenic Upper Tolerance Limit with 95% Coverage[1] and 95% Confidence

Constituent Name	Upper Limit	Background N	Background Wells	Background Mean	Standard Deviation	% Non-detects	Non-detect Adjustment	Transformation	Alpha	Method	Minimum Achieved Coverage
Arsenic (mg/L)	0.22	31	MW-1,MW-37A	n/a	n/a	74	n/a	n/a	0.2039	NP Inter(normality)	91%

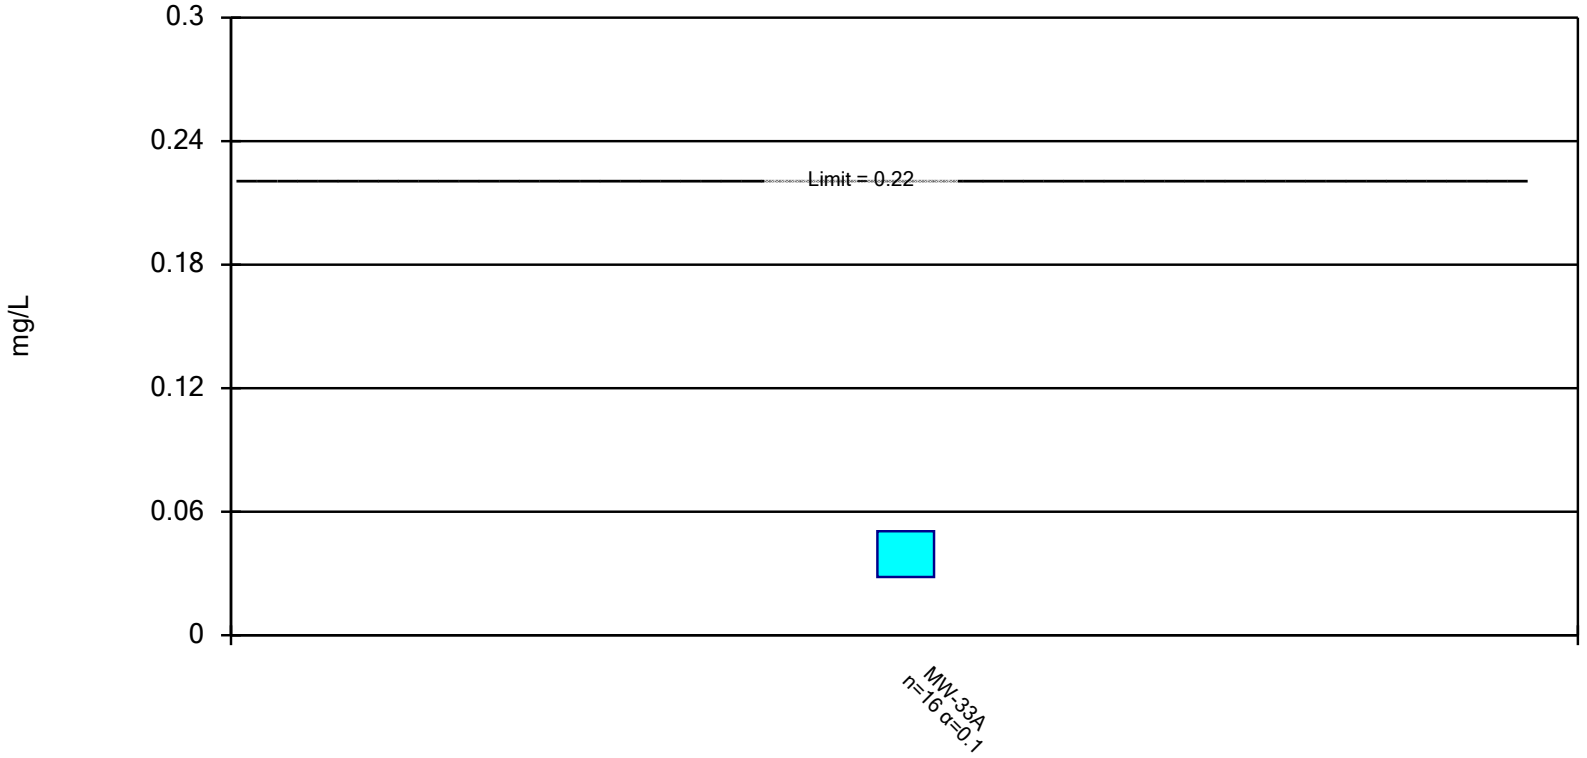
[1] Note that a nonparametric tolerance limit was utilized in the cobalt background calculation. The nonparametric limit achieves 90% coverage.

Shallow Groundwater

Confidence Interval - Corrective Action Mode [1]

Constituent Name	Well	Upper Limit	Lower Limit	Compliance Limit [2,3,4]	Exceed	N	Mean	Standard Deviation	% Non-detects	Non-detect Adjustment	Transformation	Alpha	Method
Corrective Action Monitoring Locations													
Arsenic (mg/L)	MW-33A	0.0506	0.0283	0.22	No	16	0.0395	0.0332	0	None	No	0.1	Param.
Cobalt (mg/L)	MW-29A	0.0127	0.0097	0.0034	Yes	15	0.0112	0.0042	0	None	No	0.1	Param.
Cobalt (mg/L)	MW-31A	0.0120	0.0034	0.0034	Yes	15	0.0086	0.0079	0	None	No	0.1	NP (normality)
Delineation Monitoring Locations													
Cobalt (mg/L)	MW-43A	0.0042	0.0036	0.0034	Yes	9	0.00393	0.00067	0	None	No	0.1	Param.

[1] Under corrective action mode, an SSL is rejected when the upper confidence limit lies below the groundwater protection standard (compliance limit).



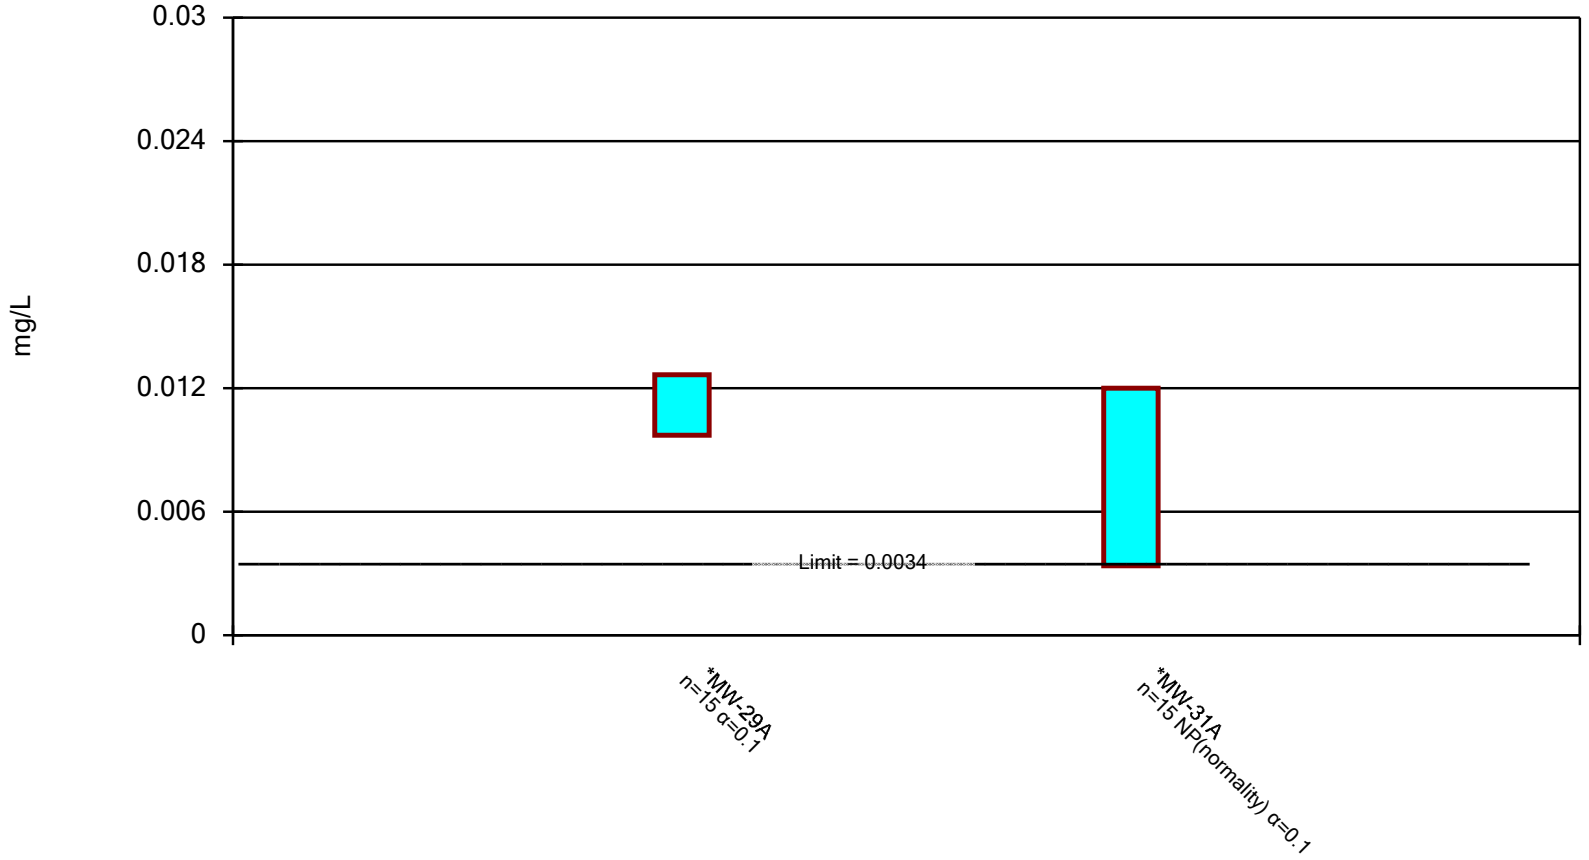
[2] Value is the 40 CFR Part 141 Safe Drinking Water Act MCL or the IAC 567 Chapter 137 Statewide Standard for a Protected Groundwater Source.

[3] Using the one-sample testing method, the fixed GWPS for arsenic was calculated as the background upper tolerance limit with 95% confidence and 95% coverage. Note that a nonparametric tolerance limit was utilized in the arsenic background calculation. The nonparametric limit achieves 90% coverage.

[4] A site-specific GWPS of 0.0034 mg/L for cobalt has been established and is detailed in the *2024 UPDATE Winneshiek Hydrologic Monitoring System Plan* (AECOM, 2024), which was approved by the IDNR in their letter dated October 29, 2024 (IDNR, 2024).

Parametric Confidence Interval, Corrective Action Mode

Compliance Limit is not exceeded. Normality Test: Shapiro Wilk, alpha based on n.



Constituent: Arsenic Analysis Run 12/20/2025 4:32 PM

Winneshiek County SLF Client: Foth Data: Winneshiek Shallow Groundwater - Fall 2025 Evaluation

Parametric and Non-Parametric (NP) Confidence Interval, Corrective Action Mode

Compliance limit is exceeded.* Normality Test: Shapiro Wilk, alpha based on n.

eurofins | Environment Testing

ANALYTICAL REPORT

PREPARED FOR

Attn: Nick Schrock
AECOM
501 Sycamore Street
Suite #222
Waterloo, Iowa 50703

Generated 6/17/2025 1:13:28 PM

JOB DESCRIPTION

Winneshiek SWPPP Sampling

JOB NUMBER

310-307743-1

Eurofins Cedar Falls
3019 Venture Way
Cedar Falls IA 50613

See page two for job notes and contact information.

my EOL

Eurofins Cedar Falls

Job Notes

This report may not be reproduced except in full, and with written approval from the laboratory. The results relate only to the samples tested. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

The test results in this report relate only to the samples as received by the laboratory and will meet all requirements of the methodology, with any exceptions noted. This report shall not be reproduced except in full, without the express written approval of the laboratory. All questions should be directed to the Eurofins Environment Testing North Central, LLC Project Manager.

Authorization

Generated
6/17/2025 1:13:28 PM

Authorized for release by
Zach Bindert, Senior Project Manager
Zach.Bindert@et.eurofinsus.com
(319)595-2016

Job ID: 310-307743-1 — Eurofins Cedar Falls

Job Narrative
310-307743-1

Analytical test results meet all requirements of the associated regulatory program listed on the Accreditation/Certification Summary Page unless otherwise noted under the individual analysis. Data qualifiers and/or narrative comments are included to explain any exceptions, if applicable.

- Matrix QC may not be reported if insufficient sample is provided or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD may be performed, unless otherwise specified in the method.
- Surrogate and/or isotope dilution analyte recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in the narrative.

Regulated compliance samples (e.g. SDWA, NPDES) must comply with the associated agency requirements/permits.

Receipt
The samples were received on 6/3/2025 3:50 PM. Unless otherwise noted below, the samples arrived in good condition, and, where required, properly preserved and on ice. The temperatures of the 3 coolers at receipt time were 10.4°C, 12.6°C and 13.5°C.

GC/MS Semi VOA
Method 8270E: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with preparation batch 310-456568. The laboratory control sample (LCS) was performed in duplicate (LCSD) to provide precision data for this batch.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

HPLC/IC
No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Metals
No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

General Chemistry
No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Sample Summary

Client: AECOM

Accreditation/Certification and Definitions Summary

Client: AECOM
Job ID: 310-307743-1
Project/Site: Winneshiek SWPPP Sampling

Laboratory: Eurofins Cedar Falls

Unless otherwise noted, all analytes for this laboratory were covered under each accreditation/certification below.

Authority	Program	Identification Number	Expiration Date
Iowa	State	007	12-01-25

The following analytes are included in this report, but the laboratory is not certified by the governing authority. This list may include analytes for which the agency does not offer certification.

Analysis Method	Prep Method	Matrix	Analyte
8270E	3510C	Ground Water	Alpha-Terpineol
8270E	3510C	Ground Water	Aniline
8270E	3510C	Ground Water	Benzoic acid
8270E	3510C	Ground Water	Pyridine
8270E	3510C	Groundwater	Alpha-Terpineol
8270E	3510C	Groundwater	Aniline
8270E	3510C	Groundwater	Benzoic acid
8270E	3510C	Groundwater	Pyridine

Qualifiers

General Chemistry

Qualifier	Qualifier Description
F1	MS and/or MSD recovery exceeds control limits.
HF	Parameter with a holding time of 15 minutes. Test performed by laboratory at client's request. Sample was analyzed outside of hold time.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
1C	Result is from the primary column on a dual-column method.
2C	Result is from the confirmation column on a dual-column method.
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
MRL	Method Reporting Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent

Glossary (Continued)

Abbreviation	These commonly used abbreviations may or may not be present in this report.
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
SDL	Sample Detection Limit
SDL	Sample Detection Limit
SDL	Sample Detection Limit
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Cooler/Sample Receipt and Temperature Log Form

Client Information					
Client: AECOM					
City/State:	CITY	STATE	Project:		
Receipt Information					
Date/Time Received:	DATE 6.3.25	TIME 1550	Received By: CGC		
Delivery Type: ☐ UPS ☐ FedEx CGC 6.3.25 ☐ FedEx Ground ☐ US Mail ☐ Spee-Dee ☐ Lab Courier ☐ Lab Field Services ☑ Client Drop-off ☐ Other:					
Condition of Cooler/Containers					
Sample(s) received in Cooler?	☑ Yes	☐ No	*If yes:* Cooler ID:		
Multiple Coolers?	☑ Yes	☐ No	*If yes:* Cooler # 1 of 3		
Cooler Custody Seals Present?	☑ Yes	☐ No	*If yes:* Cooler custody seals intact?	☑ Yes	☐ No
Sample Custody Seals Present?	☐ Yes	☑ No	*If yes:* Sample custody seals intact?	☐ Yes	☐ No
Trip Blank Present?	☐ Yes	☑ No	*If yes:* Which VOA samples are in cooler? ↓		
Temperature Record					
Coolant: ☑ Wet ice ☐ Blue ice ☐ Dry ice ☐ Other. ☐ NONE					
Thermometer ID: AA			Correction Factor (°C): 0		
• **Temp Blank Temperature** – If no temp blank, or temp blank temperature above criteria, proceed to Sample Container Temperature					
Uncorrected Temp (°C): 11.5			Corrected Temp (°C): 11.5		
• **Sample Container Temperature**					
Container(s) used:	CONTAINER 1: 250mL Plastic HNO3		CONTAINER 2		
Uncorrected Temp (°C):	10.4				
Corrected Temp (°C):	10.4				
Exceptions Noted					
1) If temperature exceeds criteria, was sample(s) received same day of sampling?				☑ Yes	☐ No
a) *If yes:* Is there evidence that the chilling process began?				☑ Yes	☐ No
2) If temperature is <0°C, are there obvious signs that the integrity of sample containers is compromised? (e.g., bulging septa, broken/cracked bottles, frozen solid?)				☐ Yes	☐ No
NOTE. If yes, contact PM before proceeding If no, proceed with login
